SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 17
SEPTEMBER 1, 1973

W73-010401 – W73-011050

LIBRARY U. OF I., URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $22 (domestic), $27.50 (foreign), single copy price $3. Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

VOLUME 6, NUMBER 17
SEPTEMBER 1, 1973

W73-010401 – W73-011050

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

LIBRARY U. OF I., URBANA-CHAMPAIGN

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

LIBRARY U. OF I. URBANA-CHAMPAIGN

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

LIBRARY U. OF I. URBANA-CHAMPAIGN

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SODIUM AND MAGNESIUM SULFATE ION PAIRING: EVIDENCE FROM RAMAN SPECTROSCOPY,
Rhode Island Univ., Kingston. Dept. of Chemistry.
F. P. Daly, C. W. Brown, and D. R. Kester.
Journal of Physical Chemistry, Vol 76, No 24, p 3664-3668, 1972. 2 fig, 3 tab, 31 ref. OWRR B-036-RI (2).

Descriptors: *Chemical analysis, *Aqueous solutions, *Spectroscopy, Electrolytes, Sodium, Magnesium, Sulfates, Hydrogen bonding, Ionization, Chemical reactions, Analytical techniques, Evaluation.

Raman spectra of aqueous solutions of sodium and magnesium sulfates were measured but failed to reveal any evidence of ion pairing. However, sulfate solutions with HCl added did exhibit relatively strong bands due to HSO4. Evidence for MgSO4 and NaSO4 ion pairs was obtained by the addition of sodium and magnesium salts to the latter solution; both cations compete with hydrogen ions for the SO4. This is clearly demonstrated in the Raman spectra by a decrease in intensity of the band assigned to HSO4 at 1,053 cm and an increase in intensity of the band assigned to SO4 at 982 cm in the solutions with sodium or magnesium added. 02. WATER CYCLE

2A. General

SYNTHESIS AND EVALUATION OF URBAN-REGIONAL HYDROLOGIC RAINFALL-RUNOFF CRITERIA,
Environmental Dynamics, Inc., Los Angeles, Calif.
J. A. Dracup, T. J. Fogarty, and S. G. Grant.
Available from the National Technical Information Service as PB-220 965, $3.00 in paper copy, $0.95 in microfiche. Completion Report, February 1973. 105 p, 9 fig, 5 tab, 48 ref, 2 append. OWRR C-2182 (3407) (1).

Descriptors: *Rainfall-runoff relationships, *Hydrologic models, Waterbeds (Basins), Model studies, *Hydrologic cycle, Runoff, Rainfall, *Mathematical models, Data collections, Research and development, Regional analysis.
Identifiers: *Urban watersheds, *Research application.

Mathematical models of the hydrologic rainfall-runoff process are applied, evaluated and compared, using data from urban and natural watersheds. Criteria are developed for use in the selection of an appropriate hydrologic rainfall-runoff model for specific watershed needs. This study is oriented specifically at closing the gap between research and its application by practicing engineers and hydrologists in the water resources field. New models are not developed, but the use of existing models is clarified through a selection display tableau and user oriented computer programs implementing a wide range of rainfall-runoff models.

THE INTERNATIONAL HYDROLOGICAL DECADE--A PRELIMINARY EVALUATION OF A COOPERATIVE EFFORT IN THE EARTH SCIENCE FIELD,
L. A. Heindl.
In: Earth Science Aid to Developing Countries, Second Symposium of the 24th International Geological Congress, Montreal: International Geological Congress, Ottawa, Canada, p 135-141, 1972. 6 ref.

Descriptors: *International Hydrologic Decade, *Reviews, *Hydrology, *Water resources development, Foreign countries, Programs, Evaluation, Conferences, Cooperatives, Organizations, Economics, Water demand, Water supply.
Identifiers: Developing countries, Earth sciences.

The International Hydrological Decade's central scientific effort is improving the scientific understanding of the world water balance. The decade program lists about 60 problem areas in which nations are encouraged to participate through national efforts and international cooperation and coordination. At the Mid-Decade Conference (December 1969) a majority of 75 nations represented, mostly developing countries, voted to concentrate the last five years of the Decade on practical aspects of hydrology of benefit to developing countries rather than to continue emphasis on scientific results--not that scientific programs were to be abandoned. Developing countries are not so much anti-science as they are for solving their growing practical problems. They favor those aspects of science with direct application in improving standards of living. They are satisfied to use advances made elsewhere or to gear their scientific programs to plug gaps in the research done elsewhere where this serves the national interest. The logical deductions seem to be that international scientific programs must be geared to the short- and long-term needs of the recipient country, rather than to the interests of the doner scientists, or of science per se. The development of a scientific capability in the natural resource field must be done within the framework of satisfying a developing country's practical and immediate needs. (Woodard-USGS)

WATER BALANCE IN SOVIET CENTRAL ASISA (VODNYY BALANS TERRITORII SREDNEY AZII).
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).

Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 62 (77), Ivanov, Yu. N., editor, Leningrad, 1972. 104 p.

Descriptors: *Water balance, *Precipitation (Atomospheric), *Runoff, *Evaporation, Transpiration, Temperature, Interception, Water loss, Water resources, Water quality, Soils, Soil moisture, Vegetation, Mountains, Lakes, Surfaces, Irrigation, Analytical techniques, Instrumentation, Measurement.
Identifiers: *USSR, *Soviet Central Asia, Isolines, Nomograms.

Various items in the water balance of Soviet Central Asia are investigated in this collection of 10 papers published by the Central Asian Hydrometeorological Scientific Research Institute at Tashkent. The influence of mountain topography on distribution of precipitation is examined, and a method is proposed for determining the amount of rainfall that is intercepted by vegetation. Studies are made of evaporation from free-water and soil surfaces, and water balances in large irrigatied areas of the Fergana Valley and Golodnaya steppe are compared. WATER BALANCE AND RUNOFF LOSSES IN THE FERGANA VALLEY AND GOLODNAYA STEPPE (STRUKTURA VODNOGO BALANSA I POTERI RECHNOGO STOKA V FERGANSKOY DOLINE I GOLODNOY STEPI),
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
F. E. Rubinova, and M. I. Getker.
In: Vodnyy balans territorii Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 62 (77), p 84-90, Leningrad, 1972. 2 tab, 10 ref.

Descriptors: *Water balance, *Water loss, *Runoff, *Evaporation, Transpiration, Return flow, Withdrawal, Irrigated land, Irrigation practices.
Identifiers: USSR, *Fergana Valley, *Golodnaya steppe.

An analysis is made of water balance in two regions where irrigation is accomplished under substantially different natural conditions. In the Fergana Valley, the increase in runoff losses to evaporation on 100,000 ha of newly reclaimed land was 0.55 cu km/yr, while in the Golodnaya steppe it was 0.86 cu km/yr. The total increase in runoff losses in the valley in 1935-65 (1.7 cu km/yr) was derived from increased transpiration (2.7 cu km/yr) and reduced direct evaporation from the soil (1.0 cu km/yr). In the Golodnaya steppe, transpiration and direct evaporation from the soil increased in the same period by 1.4 cu km/yr and 0.2 cu km/yr, respectively. In 1960-65, return flow in the valley was 46.5% of the water withdrawal, while in the steppe it was 23.5%. Expansion of irrigable land in both the valley and the steppe is expected to increase runoff losses by only 1.7 cu km/yr. (See also W73-10448) (Josefson-USGS)

STOCHASTIC MODELS APPLIED TO OPERATION OF RESERVOIRS IN THE UPPER COLORADO RIVER BASIN IN TEXAS,
Texas A and M Univ., College Station. Water Resources Inst.
G. L. Curry, G. E. O'Connor, R. A. Clark, and J. C. Helm.
Available from the National Technical Information Service as PB-221 025, $3.00 in paper copy, $0.95 in microfiche. Technical Report 47, June 1973, 153 p, 21 fig, 16 tab, 78 ref. OWRR A-019-TEX (2). 14-31-0001-3844.

Descriptors: Weather modification, Optimization, *Reservoir operation, *Texas, Model studies, *Statistical models, *Simulation analysis, Precipitation (Atmospheric), *Meteorological data.
Identifiers: *Colorado River Basin (Tex), Concho River Basin (Tex), Linked reservoirs.

A hydrometeorological model (MOHS) is presented that utilized 30-day meteorological forecasts of temperature and precipitation issued every 15 days by the National Weather Service to provide an estimate of the future hydrometeorological conditions of a river basin. Use of the 30-day meteorological forecast categories of light, moderate, or heavy precipitation and below normal, near normal, or above normal temperature provide physical constraints upon quantitative values which were synthesized by a Monte-Carlo simulation technique. Estimates of monthly precipitation for meteorological stations semi-randomly located within the river basin are simulated from the square-root-normal distribution, while monthly mean data of ambient-air temperature are simulated using the Gaussian distribution. The forecast periods of temperature provided information that verified better than chance, but precipitation periods did not verify well. Contingency tables of forecast versus observed weather and conditional probabilities for each forecast category and period obtained. Three reservoirs located in the Concho River Basin in West Texas were also modeled and tested in this study. (Runkles-Tex A and M)

THE APPLICATION OF A SIMPLE RAINFALL--RUNOFF MODEL TO A CATCHMENT WITH INCOMPLETE DATA COVERAGE,
Swedish Meteorological and Hydrological Inst., Stockholm.
S. Bergstrom.
Sveriges Meteorologiska och Hydrologiska Institut, Notiser och preliminara rapporter, Serie Hydrologi, No 26, 1972. 25 p, 16 fig, 8 ref.

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Data processing, Data collections, Simulation analysis, Streamflow forecasting, Runoff forecasting.
Identifiers: *Sweden.

A rainfall-runoff model was designed to yield reasonable results with few observed variables and with simple evaluation of parameters. Input is daily values of rainfall and monthly values of the potential evaporation. Output is daily values of discharge. Many well known physical processes are deliberately left out of the model as their contribution to the complexity is not justified by the improvement of the results. Other processes are simplified and differ from the known reality in order to limit the number of parameters to optimize. The model can be used as a forecasting tool even in a poorly covered catchment. The simplicity of the model makes a rough parameter evaluation extremely easy and limits the demand of computer time. STREAM BASEFLOW PREDICTION BY CONVOLUTION OF ANTECEDENT RAINFALL EFFECTS,
Pennsylvania State Univ., University Park. Dept. of Civil Engineering.
G. Aron, and J. Borrelli.
Water Resources Bulletin, Vol 9, No 2, p 360-365, April 1973. 6 ref.

Descriptors: *Base flow, *Mathematical models, *Synthetic hydrology, Low flow, Simulation analysis, Surface-groundwater relationships, Streamflow forecasting, Antecedent precipitation.

Stream baseflow prediction is based on a parallel drain theory and convolution techniques. The infiltrating portions of several rain events are superimposed on the groundwater reserves and allowed to drain to the stream as individual baseflow responses. The convolution technique sums the contributions from each rain event to the stream to give the total baseflow at any point in time. A single lumped parameter from a parallel drain analogy represents the physical characteristics of a watershed. This parameter determines the time delay between a rainfall event and the resulting baseflow response. The procedure was applied to data from five watersheds. A 1-year data collection was used to find the best-fitting runoff delay coefficient, thus calibrating the response function which was subsequently applied to 2 test years to predict a dry-weather low-flow sequence. The agreement between predicted and observed flows was reasonably good, but marred by frequent minor rainfalls during the chosen dry periods. The application of the method should be much more successful in the western states where prolonged dry periods are common. (Knapp-USGS)

HYDROLOGY AND WATER RESOURCES IN ARIZONA AND THE SOUTHWEST, VOLUME 2.

Proceedings of the 1972 Meetings of the Arizona Section-American Water Resources Association and the Hydrology Section-Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona. (1972). 491 p.

Descriptors: *Hydrology, *Water resources, *Publication, *Arizona, *Southwest US, Arid lands, Research and development, Hydrologic cycle, Groundwater, Snowpacks, Information retrieval, Water management (Applied), Streamflow, Water quality, Water pollution, Weather modification, Water quality control, Nitrogen cycles, Decision making, Data transmission, Flood forecasting, Rainfall, Ephemeral streams.
Identifiers: Collective utility.

Presented are 28 papers by 42 university professors, government scientists, consultants, and graduate students interested in arid lands hydrology and water resources as applied to Arizona and the Southwest. The collection represents a review of the status of hydrologic research interests in this region. Topics include Colorado River trips, hydrology as a science, snowpack relationships, information systems, management attitudes, groundwater supply, subsidence, groundwater contamination, transmissivity distribution, seepage control, evaporation, legal aspects of urban runoff, watershed management to increase streamflow, weather modification, water pollution, collective utility, grass and soil filtration of runoff, nitrogen transformations of sewage effluent, turfgrass-soil system filters, stochastic decision models, data analysis, small sample bias in flood estimation, rainfall probability models, antecedent soil moisture relations, transition probabilities of monthly flow, flood routing models for ephemeral channels, bed material characteristics and transmission losses in ephemeral streams, and water disposition in ephemeral channels. (See W73-10819 thru W73-10846) (Popkin-Arizona)

HYDROLOGIC MODELING, PARAMETER ESTIMATION, AND WATERSHED CHARACTERISTICS,
Georgia Inst. of Tech., Atlanta.
L. D. James.
Journal of Hydrology, Vol 17, No 4, p 283-307, December 1972. 4 fig, 4 tab, 18 ref. OWRR C-1282 (No 1964) (6).

Descriptors: *Mathematical models, *Rainfall-runoff relationships, *Computer programs, *Urban

hydrology, Streamflow forecasting, Water yield, Simulation analysis, Water balance, Hydrologic budget, Urbanization.
Identifiers: *Stanford Watershed Model.

A general watershed model represents the runoff phase of the hydrologic cycle by a series of moisture accounting equations. The Stanford Watershed Model uses fixed equations containing variable parameters which are calibrated for a watershed by trial-and-error matching of simulated to recorded flows. Opset, a self-calibrating watershed model, was developed to estimate these parameters through a computerized least squares matching. The procedure reduces estimating scatter and provides parameter estimates which may be correlated with physical characteristics of the watershed and with watershed changes with urbanization. 2B. Precipitation

PEATMOS PROBABILITY OF PRECIPITATION FORECASTS AS AN AID IN PREDICTING PRECIPITATION AMOUNTS,
National Weather Service, Garden City, N.Y. Eastern Region.
S. E. Wasserman.
Available from NTIS, Springfield, Va. 22151 as COM-73-10243 Price $3.00 printed copy; $0.95 microfiche. National Oceanic and Atmospheric Administration Technical Memorandum NWS ER-50, December 1972. 12 p, 6 tab, 4 ref.

Descriptors: *Precipitation (Atmospheric), *Forecasting, *Precipitation intensity, *Probable maximum precipitation, Mathematical studies, Precipitation gages, Data collections, Equations, Analytical techniques, United States, Geographical regions.
Identifiers: *Precipitation amounts forecasting, Eastern United States.

The National Weather Service has developed a method of using Primitive Equation and Trajectory Model Output Statistics (PEATMOS) for determining the probability of precipitation (PoP) equal to or exceeding 0.01 inch in specified 12-hour periods. In this study the frequency of occurrence of 12-hour precipitation amounts exceeding other specified quantities in addition to 0.01 inch is determined as a function of the PEATMOS PoP. Data were collected for 13 different cities in the eastern United States. The 13 cities were chosen solely on the availability of data in a form suitable for computer processing. Single city results are preferable to results for grouped cities, but the limited amount of data available for each city required that the data be pooled. The cities were grouped according to similarity of PEATMOS PoP equations. Stations in groups 1 and 2 have identical PEATMOS PoP equations but were separated further according to geographic location. Group 1 represents the Northeast and group 2 represents the Southeast United States. The data are tabulated. (Woodard-USGS)

Descriptors: *Precipitation (Atmospheric), *Rainfall disposition, *Orography, *Mountains, *River basins, Valleys, Slopes, Elevation, Correlation analysis.
Identifiers: USSR.

For exposed, favorably oriented valleys, the coefficients of correlation of monthly and annual precipitation with distance from the divides defining the valleys are larger than those for absolute elevation. An analysis of residual coefficients of correlation of precipitation with distance, when the effects of absolute elevation are removed, shows the importance of considering these indices in precipitation estimates. For October-May, when most of the annual precipitation occurs, the residual coefficients of correlation vary between 0.40 and 0.90 for the Surkhandar'ya, Akhangaran, and Talas River valleys. Identifiers: USSR, *Uzbekistan, Nomograms.

Field experiments were conducted in Uzbekistan to determine maximum depth of wetting of trees, grasses, and shrubs. Rainfall intensity and duration and wind velocity had no effect on the amount of precipitation intercepted by vegetal cover. Precipitation losses by interception were computed for a wheat field in the Samarkand Oblast and for different species of vegetation in the Parkentsay River basin. DEVELOPMENT OF DESIGN STORM HYETOGRAPHS FOR CINCINNATI, OHIO,
Cincinnati Univ., Ohio. Dept. of Civil and Environmental Engineering.
H. C. Preul, and C. N. Papadakis.
Water Resources Bulletin, Vol 9, No 2, p 291-300, April 1973. 4 fig, 4 tab, 7 ref. EPA-WQ Research Grant 11024 DQU.

Descriptors: *Urban hydrology, *Rainfall-runoff relationships, *Hyetographs, *Design storm, *Ohio, Urban runoff, Storm runoff, Urban drainage, Mathematical models, Model studies, Simulation analysis, Depth-area-duration analysis.
Identifiers: *Cincinnati (Ohio).

A synthetic storm rainfall hyetograph for a one-year design frequency was derived from the one-year intensity-duration curve for Cincinnati, Ohio. Detailed rainfall data for a 3-year period were collected from three rain gages in the Bloody Run Sewer Watershed, an urban drainage area of 2,380 acres. The synthetic storm pattern is obtained from an analysis of the antecedent precipitation immediately preceding the maximum period of three selected durations. Only rains which produced excessive runoff were considered. The same approach can be used for other design frequencies. The purpose of this study is to provide synthetic storm hyetographs to be used as input in deterministic mathematical models simulating urban storm water runoff for the design, analysis, and possible surcharge prediction of sewer systems. (Knapp-USGS)

DISTRIBUTION OF MORE IMPORTANT COMPLEX BIOMETEOROLOGICAL INDICES OVER THE GLOBE,
M. Gregorczuk.
Ekol Pol. Vol 19, No 45, p 745-787. 1971. Illus.
Identifiers: *Distribution patterns (Temperature), Indices, *Meteorological data, Pressure, Temperature.

On the basis of data on air temperature, water vapor pressure, wind velocity, and solar radiation, calculation is presented on the spatial distribution of more important complex biometeorological indices over the globe; dry and wet cooling power calculated according to Siple and Hill's formulae, 3 varieties of effective temperatures, and the index of thermal effect of solar radiation. The spatial distribution of more important components of wet cooling and effective temperatures are also presented.—Copyright 1973, Biological Abstracts, Inc.

THE CONSTRUCTION OF A PROBABILITY DISTRIBUTION FOR RAINFALL ON A WATERSHED BY SIMULATION,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

G. Williamson, and D. R. Davis.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 369-383. (1972). 4 fig, 1 tab, 6 ref. OWRR C-3259 (3708) (2).

Descriptors: *Probability, *Distribution patterns, *Rainfall, *Simulation analysis, *Model studies, Watersheds (Basins), Rain gages, Storms, Density.

The relations between a rain gage reading and its location, the storm location and height, and the areal rain on the watershed are considered in an effort to determine a probability distribution for the areal rainfall on the watershed, given the rain gage reading at a point. When the number of rain gages on or near a watershed is small, the estimate of areal rainfall may be in considerable error, especially if the rainfall event is a thunderstorm. A rain gage reading may be viewed as a sample, since the amount of areal rainfall on a watershed can vary between extremely wide limits while the point rainfall over a single gage remains constant. The model described here attempts to simulate the interaction among variables of rain gage readings and location, and storm location, by choosing a random location and height for a storm from some probability density function; determine the rain gage reading given the distance from gage to storm center; and determine the average rainfall on the watershed. Results demonstrate that a rainfall model may be broken into segments and implemented by computer to develop probability density functions for areal rainfall, given the rain gage reading and storm location. The criteria of minimum expected variance can then be used to find the optimum gage location. (See also W73-10818) (Paylore-Arizona)

GUIDE TO WORLD INVENTORY OF SEA, LAKE AND RIVER ICE.
UNESCO--IASH Contribution to International Hydrological Decade: UNESCO Technical Papers in Hydrology, No 9, 1972. 23 p, 3 fig, 2 tab, 25 ref.

Descriptors: *Ice cover, *Surface waters, *Ice-water interfaces, Measurement, Methodology, Depth, Volume, Iced lakes, Rivers, Sea ice, International Hydrological Decade.
Identifiers: *Ice inventory methods.

The only technique recommended in this guide for measuring ice thickness on bodies of water is direct measurement through a hole in the ice cover. One possible exception is a probe developed by the Defence Research Board of Canada (Houle, 1961). It consists of a long plastic tube through the wall in which sealed bare wire electrodes are spaced 1 cm apart. Each electrode has a separate lead to the top end of the tube. The tube is filled with a resin whose thermal conductivity about matches that of ice. The tube is frozen into the ice cover at the beginning of the season in a vertical position with the top projecting. A measurement consists of observing the resistance between successive pairs of electrodes until a significant change in resistance occurs. The ice-water interface is thus located within an accuracy of about 1 cm. This device works well in freshwater, but has proved unsuitable in seawater. Also described are methods of measuring the areal extent and volume of ice over bodies of water. (Woodard-USGS)

SNOW STUDIES USING THERMAL INFRARED MEASUREMENTS FROM EARTH SATELLITES,
Environmental Research and Technology, Inc., Lexington, Mass.
J. C. Barnes, and C. J. Bowley.
Available from NTIS, Springfield, Va. 22151 as COM-72 11424 Price $3.00 printed copy; $0.95 microfiche. Allied Research Associates, Inc, Final Contract Report 8G92-F, July 1972. 112 p, 17 fig, 14 tab, 17 ref. NOAA-ESS Contract 1-35350.

Descriptors: *Remote sensing, *Snow survey, *Snowmelt, *Runoff forecasting, *Water yield, Snow, Infrared radiation, Satellites (Artificial), Calibrations, Instrumentation, Temperature, Surveys, Mapping.

Satellite thermal infrared measurements were studied for mapping snow cover using Nimbus and ITOS imagery and digitized data. The measurements were correlated with snow distributions mapped from satellite photographs and snow reports for both relatively flat terrain and mountainous areas of the United States. Thermal IR measurements can be a useful tool for mapping snow-cover extent, particularly in relatively flat terrain. In IR imagery, snow-covered areas are usually depicted by significantly brighter tones (lower temperatures) than the surrounding snow-free terrain. Digitized data show that areas with snow cover have IR temperatures, on the average, 5 to 10 deg K lower than areas with no snow. The spatial resolution of existing radiometers is marginal for mapping snow with the accuracy desired for many hydrologic applications, and in mountainous areas IR temperature measurements are influenced by terrain elevation regardless of the snow distribution. Also, IR temperatures measured over snow during the spring months can be considerably higher than the value that would be expected for a melting snow surface. Calibration problems alone cannot account for the apparent discrepancy. The relatively high IR temperatures are believed to be primarily the result of the radiometer viewing warmer surfaces, such as trees or bare rock, in addition to the melting snow field. (Knapp-USGS)

INTERNAL FRICTION OF SINGLE-CRYSTAL ICE,
Regions Research and Engineering Lab., Hanover, N.H.
J. P. Van Devender, and K. Itagaki.
Research Report 243, March 1973. 39 p, 12 fig, 2 tab, 32 ref, append.

Descriptors: *Ice, *Crystals, *Friction, Analytical techniques, Irradiation, Temperature, Data collections, Correlation analysis, Curves, Plastic deformation.
Identifiers: Single-crystal ice, Internal friction, Scratching.

The internal friction of single-crystal ice was investigated for the amplitude-independent regime and the results interpreted in terms of the prevailing theories. The study was motivated by a combination of questions raised by other experimenters. Their results were correlated with the results of these experiments to advance understanding of internal friction in dielectrics (most internal friction studies have been on metals) and the peculiar relationship between dielectric and mechanical relaxation in ice. The two theories for internal friction in ice were also tested. In addition, the effects of mechanical straining and X-irradiation on damping were studied to reveal the loss mechanism. The effects observed on the internal friction of pure, single-crystal ice, in the flexure mode of oscillation between 400 and 1400 Hz, supported the existence of a dislocation-controlled mechanism, with the drag produced by the interaction of the dislocation with the protons in the crystal. Identifiers: USSR, *Soviet Central Asia, Heat exchange, Glacier tongues, Bowen ratio.

Measurement of heat balance on the surface of glaciers in Soviet Central Asia during the ablation season is described. Intensity and duration of ablation on glaciers are examined, and a method is developed for making computations from laboratory analyses to determine losses in heat sustained by ablation. An analysis is made of the correlation between ablation and air temperature and of the problem of artificial regulation of mountain glacier runoff. (Josefson-USGS)

AN ANALYSIS OF YEARLY DIFFERENCES IN SNOWPACK INVENTORY PREDICTION RELATIONSHIPS,
Arizona Univ., Tucson. Dept. of Watershed Management.
P. F. Ffolliott, D. B. Thorud, and R. W. Enz.

In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 31-42, (1972). 3 fig, 2 tab, 7 ref. OWRR A-029-ARIZ (6).

Descriptors: *Analysis, *Snow cover, *Forest watersheds, *Vegetation effects, *Water yield, Rainfall-runoff relationships, Ponderosa pine trees, Regression analysis, Statistical methods, Moisture content, Seasonal, Snow surveys, Arizona, *Snowpack.

Inventory-prediction relationships between snowpack conditions and forest attributes may be useful in estimating water yields derived from snow, but such relationships are developed usually from source data collected over a short time period. Analyses of long-term data suggest inventory-prediction relationships developed from limited data may have more general application, however. Available records from 18 snow courses in the ponderosa pine type in Arizona provided source data in this study, which was designed to empirically analyze inventory-prediction relationships developed from long-term Snow Survey records. The primary hypothesis tested in the study, and evaluated by statistically analyzing the family of regression equations representing a snow course, was that, given a precipitation input, the distribution of snowpack water equivalent at peak seasonal accumulation is determined by the spatial arrangement of the forest cover, e.g. basal area. Generally 12 of the 18 snow courses evaluated appeared to support the hypothesis, three courses did not, and three courses were considered inconclusive. (See also W73-10818) (White-Arizona)

STRUCTURE OF A MULTI-YEAR PRESSURE RIDGE,
Cold Regions Research and Engineering Lab., Hanover, N.H.
A. Kovacs, W. F. Weeks, S. Ackley, and W. D. Hibler, III.
Arctic, Vol 26, No 1, p 22-31, March 1973. 9 fig, 12 ref.

Descriptors: *Sea ice, *Ice cover, *Navigation, *Ice, Arctic, Profiles.
Identifiers: *Pressure ridges.

Three traverse profiles were measured across a large pressure ridge in the Beaufort Sea. The ridge sail extended 4 m above sea level and the ridge keel 13 m below. The cross-sections of the ridge keel can be described as roughly semicircular. This suggests that form drag coefficients for flow transverse to the long axes of multiyear ridges may be as high as 0.8. Much of the ice in the ridge has a very low salinity and is quite strong. All the interblock voids that initially existed in the ridge at the time of formation have been completely filled with ice. Multiyear ridges are significant obstacles to even the largest icebreaking ship and should be avoided if possible. A very large first-year ridge with a sail height of 12.8 m is also described. This is the largest free-floating ridge yet measured. (Knapp-USGS)

FIELD EXPERIMENTS ON FREEZING AND THAWING AT 3.350 METERS IN THE ROCKY MOUNTAINS OF COLORADO, U.S.A.,
Universidad Nacional del Sur, Bahia Blanca (Argentina).
A. E. Corte, and A. O. Poulin.
In: Research Methods in Pleistocene Geomorphology; Proceedings of 2nd Symposium on Geomorphology, Summer 1971, Guelph, Ontario, Canada: Guelph University Publication, p 1-25, 1972. 12 fig, 1 tab.

Descriptors: *Freezing, *Thawing, *Frost action, *Alpine, *Mapping, Permafrost, *Colorado, Frost heaving, Frozen ground, Soil water, On-site tests, On-site data collections, Photogrammetry, *Rocky Mountain Region.

In the Rocky Mountains of Colorado above 3.300 meters (over the timber line) some large sorted features are similar to those of the polar regions. Similar sorted features are found at the bottom of shallow lakes well below the timber line. These features were studied to find whether they are active or inactive and related to permafrost of the last glacial event. A field experiment was started in 1959 and controlled every year until 1966 by means of stereophotographs. Three soil types were selected for the test: a clean sandy gravel; a well graded sandy gravel; and a very dirty sand gravel. A small reservoir was built to provide water for saturating the soil. Measurements of surface motions were made photogrammetrically. The area without fines did not develop horizontal sorting. The surface in 1966 was coarser than in 1960. The areas with 7% and 18% fines showed circular depressions in 1960 and 1962 produced by animal tracks or by collapse. Sorting into these depressions occurred for a year after their appearance and then ceased. (Knapp-USGS)

FREQUENCY ANALYSES OF THE RATIO OF ACTUAL TO POTENTIAL EVAPOTRANSPIRATION FOR THE STUDY OF CLIMATE AND VEGETATION RELATIONSHIPS,
Louisiana State Univ., New Orleans.
R. A. Muller.
Proceedings of the Association of American Geographers, Vol 3, p 118-122, 1971. 1 fig, 1 tab, 10 ref.

Descriptors: *Evapotranspiration, *Water balance, *Soil-water-plant relationships, *Climates, Vegetation, Frequency analysis, Analytical techniques, Model studies, Computer programs, Environmental effects, Correlation analysis, Hydrologic cycle.
Identifiers: *Actual evapotranspiration, *Potential evapotranspiration.

The application of frequency analyses is described for Thornthwaite water balance components instead of average climatic data for environmental studies. The spatial representativeness of water balance data and the relation of the index of moisture to average climatic data are considered. Monthly, seasonal, and annual frequency analyses of the ratio of actual to potential evapotranspiration (AE/PE) are introduced by four examples for comparative regional studies of relationships between climate and vegetation. These examples of AE/PE ratios are presented with the intention of encouraging further interest in the relationships among frequencies of hydroclimatic eomponents of the water balance models and environmental consequences. The water balance models are simplified descriptions of the very complex hydrologic cycle. Yet the simple models can provide hypothetical continental systems to which real world phenomena can be compared. (Woodard-USGS)

ANALYSIS OF WATER CONSUMPTION OF VARIOUS GRAPE CULTIVARS,
Levi Eshkol School of Agriculture, Jerusalem (Israel).
B. Bravdo, S. Lavee, and R. M. Samish.
Vitis. Vol 10, No 4, p 279-291, 1972. Illus.
Identifiers: Gasometric methods, *Grape cultiven, Gravimetric methods, *Transpiration, Vitis-vinifera, *Water utilization.

The efficiency of water use (transpiration ratio) was investigated in various cultivars of grape (Vitis vinifera) by gravimetric and gasometric methods. Results of gravimetric measurements showed positive correlation between water use efficiency and vigor. Regression lines of the transpiration ratio on the final dry weight differed significantly in their curves and their distance from the coordinate axes. Statistical analysis showed that the quantitative effect of vigor on the water use efficiency was smaller in the cv. 'Muscat Hamburg' than in 'Sultanina' and 'Queen of the Vineyards.' Covariance analysis showed that 'Sultanina' was a less efficient water user than 'Queen of the Vineyards' for plants with the same vigor. Gasometric methods revealed no significant differences between the cultivars, probably due to the elimination of interference and boundary layer resistance effect.--Copyright 1973, Biological Abstracts, Inc.

EVAPORATION FROM FREE-WATER SURFACES IN SOVIET CENTRAL ASIA (ISPARENIYE A VODNOY POVERKHNOSTI V USLOVIYAKH SREDNEY AZII),
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
V. N. Reyzvikh, and A. B. Popova.
In: Vodnyy balans territorii Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 62 (77), p 57-74, Leningrad, 1972. 4 fig, 8 tab, 9 ref.

Descriptors: *Evaporation, *Surfaces, *Measurement, *Evaporation pans, Temperature, Vapor pressure, Humidity, Wind velocity, Elevation, Equations.
Identifiers: USSR, *Soviet Central Asia.

Measurement of evaporation from free-water surfaces in Soviet Central Asia is currently based on use of eight 20-sq-m-circular tanks, 52 GGI-3,000 land pans, and 9 GGI-3,000 floating pans. Fifty-six percent of the instruments are located in lowland regions, 21.1% in the piedmont zone, and only 7.3% in areas at altitudes above 2,000 m. Observational periods range from 11 to 15 years for 31% of all evaporation stations, from 6 to 10 years for 40% of the stations, and are less then 5 years for the remaining 29% of the stations. Emipirical equations presently used to estimate evaporation from free-water surfaces are analyzed, and a regional formula is developed to measure evaporation from water areas in Soviet Central Asia. DISCONTINUITY IN EARLY MORNING EVAPORATION,
Calgary Univ., Alberta. Dept. of Geography.
L. C. Nkemdirim, and P. F. Haley.
Water Resources Bulletin, Vol 9, No 2, p 376-380, April 1973. 1 fig, 1 tab.

Descriptors: *Evaporation, *Meteorology, Humidity, Weather, *Canada, Winds, Solar radiation, Air-earth interfaces, Boundary processes.
Identifiers: *Calgary (Alberta).

A sudden jump was found in evaporation at Calgary, Canada from zero shortly after sunrise to a peak about an hour later and an equally dramatic return to zero occurred in another hour before proceeding in its normal course through the day. The most important atmospheric features involved were the presence at the one to two meter level during the early hours of either superadiabatic conditions or strong inversion conditions. The lapse condition usually followed after a night of strong inversion at this layer and corresponds to the initial surface heating shortly after sunrise. The requirements for sudden jumps in early morning evaporation seemed to be: sufficient soil moisture to maintain evaporation at or near the potential rate during the preceding day; low windspeed; and isothermal or inversion profile in the lower air layer followed by an abrupt change in the temperature profile to lapse condition shortly after sunrise, convectional activity, saturation of the lower air layer, and return to neutral or inversion profile. (Knapp-USGS)

COLOR IT EVAPORATION,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
M. J. Dvoracek.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 153-167, (1972). 7 fig, 1 tab, 5 ref.

Descriptors: *Evaporation, *Hydrologic properties, *Color, *Sewage, *Runoff, Radiation, Adsorption, Air temperatures, Texas, Arid lands.

Evaporation is a major hydrologic process in arid and semiarid lands. A brief review of evaporation literature indicates that a unique parameter, color, is desirable. Artificially colored water was used in a west Texas experiment to monitor evaporation rate and to note the effect of color on evaporation. Artificially green water had a higher evaporation rate than sewage and runoff. Five different colored waters were studied from 1966 to 1970. Color seems to affect the amount of adsorbed radiation as well as the extent of black radiation. The trend for a higher daily rate of evaporation existed for colored waters except during periods of low air temperature. Seven graphs are presented to support these conclusions. COMPUTING EVAPOTRANSPIRATION BY GEOSTROPHIC DRAG CONCEPT,
Cornell Univ., Ithaca, N.Y. Dept. of Civil and Environmental Engineering.
J. A. Mawdsley, and W. Brutsaert.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY1, Paper 9483, p 99-110, January 1973. 4 fig, 3 tab, 27 ref, append. OWRR A-036-NY (1).

Descriptors: *Evapotranspiration, *Evaporation, *Air-earth interfaces, *Drag, Hydrodynamics, Humidity, Temperature, Mass transfer, Diffusion, Boundary layers, Turbulent boundary layers, Boundary processes, Shear drag.
Identifiers: *Geostrophic wind, *Geostrophic drag.

A procedure is given for computing regional evapotranspiration. The assumptions underlying the model are essentially those used in the one-dimensional mass-transfer methods, but the shear stress is determined by means of the density of the air, the geostrophic drag coefficient, and the surface geostrophic wind. The main advantage of the method is that all data needed in the computation (the surface temperature, the pressure of the air, the specific humidity at two levels in the atmospheric boundary layer, and the surface geostrophic wind speed) can be obtained from standard meteorological data. Generally, good agreement was obtained between mean monthly evapotranspiration computed for a number of stations and the corresponding evaporation data obtained from Class-A pans. (Knapp-USGS)

NONLINEAR STABILITY OF PLANE POISEUILLE FLOW OF VISCOELASTIC LIQUIDS,
Delaware Univ., Newark. Dept. of Chemical Engineering.
K. C. Porteus, and M. M. Denn.
Transactions of the Society of Rheology, Vol 16, No 2, p 309-319, 1972. 7 fig, 11 ref. OWRR A-009-DEL (6).

Descriptors: *Rheology, *Critical flow, *Laminar flow, *Turbulent flow, Reynolds number, Viscosity.
Identifiers: Viscoelastic fluids.

The stability of plane Poiseuille flow to finite disturbances was studied for the second order fluid using the cascade method. The analysis was carried out for elasticity numbers up to 0.0001. In this range the Deborah number based upon disturbance propagation is small and the use of a second order fluid model is consistent. In contrast to linear theory in this region, elasticity has a stabilizing effect on finite disturbances relative to the Newtonian liquid, and the difference between stability behavior of Newtonian and slightly elastic liquids tends to disappear. RUNOFF CHARACTERISTICS OF CALIFORNIA STREAMS,
Geological Survey, Washington, D.C.
S. E. Rantz.
For sale by GPO, Washington, D.C. 20402, Price $0.70. Geological Survey Water-Supply Paper 2009-A, 1972. 38 p, 4 fig, 1 plate, 4 tab, 3 ref.

Descriptors: *Runoff, *California, *Variability, *Rainfall-runoff relationships, Snowmelt, Base flow, Altitude, Snowpacks, Streamflow, Streamflow forecasting, Precipitation (Atmospheric), Water balance, Rainfall.

California streams exhibit a wide range of runoff characteristics related to the climatologic, topographic, and geologic characteristics of the basins they drain. The runoff characteristics are identified by numerical index values. They are related to mean annual precipitation, altitude, latitude, and location. Streamflow is generally ephemeral if the mean annual precipitation is less

than 10 inches, intermittent if the mean annual precipitation is between 10 and 40 inches, and perennial if the mean annual precipitation is more than 40 inches. Latitude and altitude determine the proportion of the winter precipitation that will be stored for subsequent runoff in the late spring and summer. In general, if a watershed has at least 30% of its area above the normal altitude of the snowline on April 1, it will have significant snowmelt runoff. If the sum of the August and September runoff exceeds 3.0% of the annual runoff, base flow is well sustained. If the percentage is less than 1.5, base flow is poorly sustained. The distribution of daily flow is skewed for all streams, but it is more skewed for streams whose flow is predominantly storm runoff than for streams that carry significantly large quantities of snowmelt. Least skewed is the distribution for streams that carry large quantities of base flow. The variability of storm-runoff streams is greater than that of snowmelt streams, and the lowest values of variability are associated with streams that carry large quantities of base flow. (Knapp-USGS)

FLOODS IN NEW YORK--1969,
Geological Survey, Albany, N.Y.
F. L. Robison.
New York State Department of Environmental Conservation Report of Investigation RI-13, 1973. 33 p, 14 fig, 2 tab.

Descriptors: *Floods, *Flood damage, *Flood peak, *New York, *Flood data, Streamflow, Hydrologic data, Rainfall-runoff relationships, Gaging stations, Flood frequency, Flood flow.
Identifiers: *New York State floods (1969).

Intense rainfall in southeastern New York, July 27-28, 1969, produced high flows on streams in Sullivan and neighboring counties. Precipitation of 3.18 to 9.20 inches was reported. Total damage to streets, highways, homes, and business places in Sullivan County was estimated to exceed $2 million. The county was declared a disaster area. Peak flows on several streams ranged in frequency of occurrence between 40 and 200 years. Very heavy rains in central New York and the southwestern Adirondacks on May 18-20 totaled 3.5 to 6.5 inches. The recorded peak discharge of 11,300 cfs at the Black River at Boonville gaging station on May 20 was the second highest in 58 years of record. Because a large part of the area affected by this storm is rural, most of the damage was done to highways, bridges, and farmland. On June 23 a cloudburst dropped nearly 6 inches of rain on the village of McGraw in Cortland County. Peak discharges for the Smith and Trout Brooks have recurrence intervals greater than 50 years. Total damage in the village was estimated at $500,000. (Woodard-USGS)

THE WATER RESOURCES PROGRAMS OF THE U.S. GEOLOGICAL SURVEY,
Geological Survey, Washington, D.C.
W. A. Radlinski.
Water Resources Bulletin, Vol 9, No 2, p 366-371, April 1973.

Descriptors: *Water resources, *Research and development, *Data collections, *Investigations, *Federal government, Mapping, Surveys, Water resources development, Water quality, Groundwater, Surface waters, Hydrology, Hydrogeology.
Identifiers: *U.S. Geological Survey.

The water resources programs of the U.S. Geological Survey are unique among Federal agencies; the Survey does not operate or manage water facilities, but provides facts that are used by other organizations. This separation of fact finding from action programs assures information free from bias. USGS operates 18,000 surface water stations. Water levels are measured at 28,000 observation wells. An urban hydrology program provides data such as rainfall, runoff, and water quality for use in the management of storm runoff, land-use planning, housing development, and highway construction. Estuarine and coastal water studies are underway. A flood-hazard mapping program shows areas subject to inundation. Groundwater recharge investigations determine the extent that groundwater storage can be used to supplement storage in surface reservoirs. A subsurface waste-storage program develops information on formations used for waste storage. The Gulf Coast Hydroscience Center greatly increases capability for research and development. The National Water Data Exchange is designed to improve communications between collectors and users. (Knapp-USGS)

EFFECTS OF TIME STEP SIZE IN IMPLICIT DYNAMIC ROUTING,
National Weather Service, Silver Spring, Md. Office of Hydrology.
D. L. Fread.
Water Resources Bulletin, Vol 9, No 2, p 338-351, April 1973. 8 fig, 30 ref.

Descriptors: *Routing, *Finite element analysis, *Unsteady flow, Numerical analysis, Mathematical models, Equations, Open channel flow, Mathematical studies.
Identifiers: *Dynamic routing.

The effects of the size of the time step used in the integration of the implicit difference equations of unsteady open-channel flow were determined for typical hydrographs with durations in the order of days or weeks. Truncation errors related to the size of the time step cause a numerical distortion (dispersion and attenuation) of the computed transient. The magnitude of the distortion is related directly to the size of the time step, the length of channel reach, and the channel resistance, and inversely to the time of rise of the hydrograph. The type of finite difference expression which replaces spatial derivatives and nonderivative terms in the partial differential equations of unsteady flow has an important influence on the magnitude of the numerical distortion, as well as the numerical stability of the implicit difference equations. Time step sizes in the range of 3 to 6 hrs generally tend to minimize the combination of required computation time and numerical distortion of transients having a time of rise of the order of several days. HYDROLOGICAL STUDIES OF THE UPPER PARAGUAY RIVER BASIN (PANTANAL REGION, MATO GROSSO STATE, BRAZIL),
United Nations Educational, Scientific and Cultural Organization, New York. Div. of Natural Resources Research.
L. Lisoni, and E. Stretta.
Nature and Resources, Vol 9, No 1, p 10-13, January-March 1973.

Descriptors: Water resources development, *Hydrology, *Flood plains, *South America, Planning, Programs, Data collections, Model studies, Computer models, Flood control, Flood forecasting, Streamflow, River basins, Project purposes.
Identifiers: *Paraguay River basin (Brazil), United Nations Development Program.

Fifteen hundred kilometers west of the Atlantic coast, along the boundary between Brazil, Bolivia, and Paraguay, lies a most unusual region of the South American continent, the Pantanal zone, which consists of a huge flood plain, 50,000 square kilometers with a river basin some 400,000 square kilometers, adjoining that of the Amazon and Parana Rivers. The Paraguay River and its tributaries traverse this region at an altitude between 50 and 140 meters. In some years, streams and lagoons merge in the rainy season to form a huge sheet of water which flows slowly towards Asuncion (Paraguay) and the Rio de la Plata, moving across more than 1,500 kilometers before joining the Parana. The purpose of the project, approved by the United Nations Development Program, is to set up a hydrometeorological network in the Upper Paraguay Basin and to conduct surveys to investigate the hydraulic system of the Pantanal; at the same time environmental studies will be carried out, and an attempt will be made to establish a flood forecasting system based on an experimental model. (Woodard-USGS)

PREDICTING DEGREE DAY SNOW MELT FACTORS WITH CROWN CLOSURE IN ARIZONA PONDEROSA PINE,
Arizona Univ., Tucson. Dept. of Watershed Management.
P. L. Jackson.
M.S. Thesis, 1972. 51 p, 11 fig, 6 tab, 44 ref. OWRR-A-029-ARIZ (1).

Descriptors: *Forecasting, *Snowmelt, *Canopy, *Ponderosa Pine, *Snow management, *Arizona, Limiting factors, Southwest U.S., Water demand, Water supply, Water harvesting, Model studies, *Regression analysis, Air temperature, Equations, Rainfall-runoff relationships.
Identifiers: *Crown closure.

Water is a major factor limiting man's economic and social development in the arid regions of the Southwest. Increased water demand in Arizona causes evaluation of possibilities for increasing surface runoff from high elevation snow accumulation areas. Snow-melt indices based on air temperatures were evaluated using Arizona ponderosa pine overstory crown closure as an inventory prediction variable by regression analysis. Degree day snowmelt factors were dependent variables and percent crown closure was the independent variable. Median air temperature was non-significant. Maximum air temperature was significant, though it explained only 12 percent of the variation in snowmelt. The regression equation does not appear adequate for snowmelt prediction in field situations. Crown closure did not appear to be an adequate predictor of median or maximum temperature degree day snow melt factors in Arizona ponderosa pine. (Popkin-Arizona)

INFLUENCE OF SURFACE AND NEAR-SURFACE CALICHE DISTRIBUTION ON INFILTRATION CHARACTERISTICS AND FLOODING, LAS VEGAS AREA, NEVADA,
Nevada Univ., Reno. Center for Water Resources Research.
R. L. Cooley, G. W. Fiero, Jr., L. H. Lattman, and A. L. Mindling.
Available from the National Technical Information Service as PB-221 121, $3.00 in paper copy, $0.95 in microfiche. Project Report No. 21, February 1973, 41 p., 33 fig, 2 tab, 17 ref, append. OWRR B-055-NEV (1). 14-31-0001-3613.

Descriptors: *Caliche, *Infiltration, *Flash floods, Urban drainage, *Nevada, Floods, *Flood control, Runoff, Precipitation (Atmospheric), Impoundments.
Identifiers: *Las Vegas (Nev.), *Red Rock Canyon Fan (Nev.).

The study was conducted on the Red Rock Canyon fan which is a large alluvial fan bordering the Las Vegas basin on the east flank of the Spring Mountains. The objectives were (1) to determine the types, degrees of development, and distribution of calcium carbonate deposition on the Red Rock Canyon fan as these affect infiltration and runoff; (2) to investigate the engineering projects designed for flood control in the urban area in relation to the expected runoff; (3) to obtain geomorphic and hydrologic information essential to the selection of alternative sites for artificial recharge and flood impoundments; and (4) to coordinate the study with local agencies currently planning flood control projects. Because adequate precipitation and runoff data were not available and could not be collected during the short term of the project, the study was concentrated upon the potential for the factors studied to influence runoff. A SOLUTION TO SMALL SAMPLE BIAS IN FLOOD ESTIMATION,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
W. Metler.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 351-368, (1972). 3 ref.

Descriptors: *Flood forecasting, *Sampling, *Algorithms, *Design criteria, Statistical models, Culverts, Bridges, Regression analysis, Equations, History, Stream gages, Average flow, Peak discharge, Regional flood, Regional development, Missouri.

To design culverts and bridges that will pass certain design floods, computations of the estimates of such floods must be specified. Regression analysis is one method of predicting design floods for construction sites. Determination of such predictions depends on the regression coefficients, which in turn depend on estimates of the floods computed from historical records. The computation of the historical estimate that must serve as input to the regression analysis is discussed. Regression predictions based on inputs computed from the number of standard normal deviates from the mean introduce a bias into the estimate, however, because of the small sample size commonly encountered in streamflow estimation. The predictions will, therefore, always be less than regression predictions based on the so-called t-estimate which will provide a more realistic prediction. Equations demonstrate the applicability of this theory. Demonstration sites chosen are in the plains region of Missouri, restricted to those areas of less than 30 sq. miles, where historical records were provided by the USGS. OBJECTIVE AND SUBJECTIVE ANALYSIS OF TRANSITION PROBABILITIES OF MONTHLY FLOW ON AN EPHEMERAL STREAM,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
W. Dvoranchik, L. Duckstein, and C. C. Kisiel.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the American Water Resources Assn., Arizona Section, and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 407-437. 1972. 6 tab, 2 fig, 7 ref.

Descriptors: *Analysis, *Probability, *Monthly, *Ephemeral streams, *Statistical methods, Watershed management, Stochastic processes, Daily hydrographs, Streamflow forecasting, Model studies, Digital computers, Simulation analysis, Regulation, Arizona, Arid lands.

A critique of statistical properties of monthly flows on an ephemeral stream in Arizona is given. A subjective procedure, justified for managerial purposes not concerned with the variability of flow within the month, is proposed for sequential generation of monthly flow data. Ephemeral flows should be modeled by starting with at least historical daily flows for more meaningful monthly flow models. Stochastic properties of monthly streamflows and state transition probabilities are reviewed with regard to ephemeral streams. A flow chart for a streamflow model geared to digital computers, with a simulation of streamflow subroutine, is developed. Meaningful monthly flow models could serve as a check on alternative models (subjective matrix, lag-one auto regressive, harmonic, bivariate normal, bivariate log-normal models). Rules and guidelines are presented in developing meaningful probability matrices. (See also W73-10818) (Popkin-Arizona)

A PROPOSED MODEL FOR FLOOD ROUTING IN ABSTRACTING EPHEMERAL CHANNELS,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
L. J. Lane.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section-Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 439-453. (1972). 3 fig, 1 tab, 23 ref.

Descriptors: *Model studies, *Flood routing, *Flood forecasting, *Ephemeral streams, *Rainfall disposition, Rainfall-runoff relationships, Watershed management, Range management, Thunderstorms, Rainfall, Streamflow, Vegetation, Groundwater recharge, Bank storage, Rates, Storage, Arizona.

Almost all runoff from semiarid rangeland watersheds in southern Arizona results from intense highly variable thunderstorm rainfall. Abstractions, or transmission losses, are important in diminishing streamflow, supporting riparian vegetation and providing natural groundwater recharge. A flood routing procedure is developed using data from the Walnut Gulch Experimental Watershed, where flood movement and transmission losses are represented by a system using storage in the channel reach as a state variable which determines loss rates. Abstractions are computed as a cascade of general components in linear form. Wide variation in the parameters of this linear model with increasing inflow indicates that a linear relation between losses and storage is probably incorrect for ephemeral channels. (See also W73-10818) (Popkin-Arizona)
W73-10844

BED MATERIAL CHARACTERISTICS AND TRANSMISSION LOSSES IN AN EPHEMERAL STREAM,
Agricultural Research Service, Tucson. Southwest Watershed Research Center.
J. B. Murphey, L. J. Lane, and M. H. Diskin.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 455-472. (1972). 2 tab, 3 fig, 8 ref.

Descriptors: *Bed load, *Channel morphology, *Ephemeral streams, *Streamflow, *Thunderstorms, Convection, Storms, Limiting factors, Geology, Geomorphology, Volume, Porosity, Specific yield, Alluvium, Absorption, Cross sections, Correlation analysis, Arizona, Arid lands.
Identifiers: Transmission losses.

An average of 6 to 13 streamflows from intense summer convective storms occurs annually in the Walnut Gulch Experimental Station, 58 square miles in southeastern Arizona. Flows last generally less than 6 hours, and the channels are dry 99 percent of the time. The limiting factors imposed by the geology and geomorphology of the channel to transmission losses of a 6 square mile channel in the Station are described. The Precambriam to Quaternary geology is outlined, and geomorpholoyg of the channels are described. Volume, porosity and specific yield of alluvium were determined. There is 106 acre-feet of alluvium with a mean specific yield of 28 percent, and a maximum water absorbing capacity of 29 acre-feet or 7 acre-feet per mile of reach. Channel slope is insensitive to changes in geological material beneath it or to changes in flow regime. Channel cross section is highly sensitive to geology and flow regime. Transmission losses were highly correlated to volume of inflow. (See also W73-10818) (Popkin-Arizona)

WATER DISPOSITION IN EPHEMERAL STREAM CHANNELS,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
T. W. Sammis.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 473-491. (1972). 5 fig, 3 tab, 15 ref.

Descriptors: *Rainfall disposition, *Ephemeral streams, *Groundwater recharge, *Infiltration, *Evapotranspiration, Equations, Forecasting, Vegetation, Channels, Climates, Evaporation, Instrumentation, Infiltrometers, Simulation analysis, Soil structure, Field capacity, Arizona, Arid lands, Riparian plants.
Identifiers: Transmission losses, Philip's equation.

The contribution of flows from small watersheds to groundwater recharge is of interest. Water disposition depends on infiltration and evaporation characteristics. This study had the objective of developing an infiltration equation for estimating transmission losses during a flow event in an ephemeral stream near Tucson, Arizona, in the Rocky Mountain Forest and Range Experiment Station. Palo verde, desert hackberry, cholla, marmontea and mesquite are the major bank species of the sandy channels. A climatic section consisting of a hydrothermograph recording rain gage and class A evaporation pan was installed. A water balance method was used to estimate evapotranspiration. A specially designed infiltrometer was used to simulate flow events. The data allowed the following conclusions: Philip's infiltration equation is an excellent mathematical model, initial moisture affects initial infiltration rate, the Philip coefficients are determinable by the infiltrometer constructed, soil moisture affects infiltration rates, and transpiration rates diminish linearly proportional to the ratio of available water to field capacity. COMPARISON OF BRIDGE BACKWATER RELATIONS,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
G. V. Skogerboe, J. W. H. Barrett, W. R. Walker, and L. H. Austin.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Paper 9799, p 921-938, June 1973. 14 fig, 8 ref, append. AID Contract csd-2460.

Descriptors: *Backwater, *Flow profiles, *Equations, *Bridges, Non-uniform flow, Open channel flow, Subcritical flow, Stage-discharge relations.
Identifiers: *Submerged flow.

Flow conditions at a proposed bridge site on an open channel may be either uniform or nonuniform, depending on channel conditions. The effect of the constriction on the water surface profile, both upstream and downstream, is conveniently measured with respect to the normal water surface profile, which is the water surface in the absence of the constriction under the original flow conditions. Irrespective of the original flow conditions existing at the bridge site, by using a combination of the momentum and continuity equations a general submerged flow equation may be obtained for the open-channel constriction. By making two simplifying assumptions and manipulating the remaining variables, this equation may be expressed in the form of a submerged flow equation. The equations may be plotted on the coordinates used for submerged flow analysis, with head loss as the abscissa, discharge as the ordinate, and a series of parallel straight lines of slope 3/2 representing the different values of submergence. GEOHYDROLOGIC STUDY OF THE GORT LOWLAND AND ADJACENT AREAS OF WESTERN IRELAND USING ENVIRONMENTAL ISOTOPES,
Ceylon Univ., Peradeniya.
R. Bowen, and P. W. Williams.
Water Resources Research, Vol 9, No 3, p 753-758, June 1973. 3 fig, 2 tab, 9 ref.

Descriptors: *Karst hydrology, *Water circulation, Mixing, Groundwater movement, Karst, Tritium, Tracers, Stable isotopes, Oxygen isotopes, Hydrogeology, Groundwater basins.
Identifiers: *Ireland (Gort Lowland).

Analyses of 0-18 and tritium in precipitation, surface waters, and groundwaters in western Ireland show that the groundwaters fall into a single group isotopically indicative of the good mixing to be expected in a karstic region. Components of modern (post-1954) recharge are present, suggesting relatively rapid circulation in the groundwater system. Some retarding of circulation is a result of 'covered karst' mantling. (Knapp-USGS)

MASS BALANCE AND SPECTRAL ANALYSIS APPLIED TO KARST HYDROLOGIC NETWORKS,
Alberta Univ., Edmonton. Dept. of Geography.
M. C. Brown.

UNIVERSITY OF ILLINOIS URBANA CHAMPAIGN

Water Resources Research, Vol 9, No 3, p 749-752, June 1973. 4 fig, 8 ref.

Descriptors: *Water balance, *Karst hydrology, *Statistical methods, Variability, Tracers, Hydrologic budget, Caves, Subsurface flow, Fourier analysis, Frequency analysis, Input-output analysis.
Identifiers: Spectral analysis.

Underground karst drainage systems can be studied by the input-output relations of rivers that flow through them. Tracers enable the quantity of water at a sink that flows to a specific spring, and the fraction of a given spring derived from a sink, to be calculated. When tracer methods are not applicable, cross-covariance and cross-spectral transfer function analysis can be used to examine input-output stage records. These give information about the vadose and/or phreatic nature of the system. An inaccessible karst drainage system in western Alberta has a tracer flow-through time of 80 to 130 hours and a positively skewed cross covariance of 70 to 124 hours; therefore the cave is not completely water filled. Additional unknown inputs are substantiated by a negatively peaking cross covariance. (Knapp-USGS)

BEHAVIOR OF GROUNDWATER FLOW SUBJECT TO TIME-VARYING RECHARGE,
Water Resources Engineers, Inc., Springfield, Va.
M. T. Tseng, and R. M. Ragan.
Water Resources Research, Vol 9, No 3, p 734-742, June 1973. 12 fig, 9 ref.

Descriptors: *Groundwater movement, *Recharge, *Equations, *Numerical analysis, Hydraulic models, Water table, Simulation analysis, Mathematical models.
Identifiers: Hele-Shaw models.

The dynamic response of two-dimensional unconfined aquifers subject to localized recharge was studied theoretically. The variations of free surface profiles, discharges, and the flow patterns with respect to time in both fully penetrated and partially penetrated aquifer systems are obtained by solving the governing partial differential equations numerically. The method treats the nonlinear free surface boundary as an initial condition, and the overall flow region is solved as a boundary value problem. The numerical results agree with experimental data obtained from Hele-Shaw models. The method may be applied to study the quantitative and qualitative changes in groundwater reservoirs resulting from artificial or natural recharge. (Knapp-USGS)

MATHEMATICAL SIMULATION OF THE SUBSIDENCE OF VENICE: 1. THEORY,
Centro di Ricera IBM di Venezia (Italy).
G. Gambolati, and R. A. Freeze.
Water Resources Research, Vol 9, No 3, p 721-733, June 1973. 3 fig, 30 ref.

Descriptors: *Land subsidence, *Withdrawal, *Mathematical models, Subsidence, Consolidation, Hydrogeology, Compaction, Water levels, Drawdown, Soil mechanics, Mathematical studies, Finite element analysis, Numerical analysis.
Identifiers: *Venice (Italy).

Land subsidence theory was used to construct a mathematical model to simulate the subsidence at Venice. The model can be used to link realistically the occurrence of land subsidence to the groundwater withdrawals that are its cause. Approaches based on the independent solution of the diffusion equation are practical as long as the conditions underlying the development of the equation are recognized, and, if necessary, monitored. A two-step procedure is used to analyze the subsidence in the complex aquifer-aquitard system. First, the regional hydraulic head drawdowns are calculated in a two-dimensional vertical cross section in radial coordinates using an idealized 10-layer representation of the geology. The computation are carried out with a model based on the diffusion equation and solved with a numerical finite element technique. The calculated head values in the aquifers are then used as time dependent boundary conditions in a set of one-dimensional vertical consolidation models solved with a finite difference technique and applied to a more refined representation of each aquitard. GEOMORPHOLOGY AND HYDROLOGY OF KARST DRAINAGE BASINS AND CAVE CHANNEL NETWORKS IN EAST CENTRAL NEW YORK,
Texas Univ., Austin. Dept. of Geological Sciences.
V. R. Baker.
Water Resource Research, Vol 9, No 3, p 695-706, June 1973. 13 fig, 1 tab, 39 ref.

Descriptors: *Karst hydrology, *New York, *Karst, *Geomorphology, Hortons law, Caves, Meanders, Carbonate rocks, Subsurface drainage, Sinks, Springs, Terrain analysis, Hydrogeology, Groundwater movement, Tracers, Dye releases.

Surface water in the karst drainage basins of east central New York is collected by swallow holes on upland surfaces. Free surface streams, flowing through meandering cave conduits, provide links between the upland surface catchments and large karst springs draining into the major river valleys. Flow through the conduits fluctuates markedly with surface runoff. Mean velocities of 0.5 ft/sec were determined during a period of rapid snowmelt by dye tests. The cave conduits form an integral part of a drainage organization characterized by Horton's hierarchy stream numbers, lengths, and drainage areas. The conduits, the highest-order streams in the hierarchy, have meandering reaches with wavelengths directly related to upstream drainage area and contributed runoff. Both the morphology of the cave channels and the hydrology of the karst drainage basins are strikingly similar to those observed in surface water stream systems. (Knapp-USGS)

RAYLEIGH-RITZ AND GALERKIN FINITE ELEMENTS FOR DIFFUSION-CONVECTION PROBLEMS,
Manchester Univ. (England). Simon Engineering Lab.
I. M. Smith, R. V. Farraday, and B. A. O'Connor.
Water Resources Research, Vol 9, No 3, p 593-606, June 1973. 16 fig, 26 ref.

Descriptors: *Finite element analysis, *Diffusion, *Convection, Numerical analysis, Groundwater movement, Mixing, Mathematical studies, Mathematical models, Porous media, Heat transfer.
Identifiers: Galerkins method.

Finite element methods are presented for the solution of two-dimensional partial differential equations of interest in water resource problems. Galerkin's method for one-dimensional problems is shown to be a prototype finite element technique. Previous variational (Rayleigh-Ritz) formulations of finite elements for some problems are misleading and are of limited application when compared with Galerkin's method. The accuracy and stability of the techniques presented are discussed in relation to the numerical diffusion and dispersion phenomena prevalent in finite difference methods. (Knapp-USGS)

HYDROLOGIC STUDIES USING THE BOUSSINESQ EQUATION WITH A RECHARGE TERM,
Stanford Univ., Calif. Dept. of Applied Earth Sciences.
M. B. Zucker, I. Remson, J. Ebert, and E. Aguado.
Water Resources Research, Vol 9, No 3, p 586-592, June 1973. 8 fig, 19 ref. NSF Grant GK-26153X1.

Descriptors: *Groundwater movement, *Equations, *Mathematical models, *Water balance, *Recharge, Hydrogeology, Dupuit-Forchheimer theory, Drawdown, Water yield.
Identifiers: *Boussinesq equation.

The Boussinesq equation, which describes one-dimensional unconfined groundwater movement, was modified to accept groundwater recharge as computed by a climatological soil-moisture balance. It may be solved by using a predictor-corrector technique for nonlinear partial differential equations. The method is useful in studies of the effects of system parameters on groundwater and in the determination of system parameters by the inverse method. The effects of land development on groundwater yield and on groundwater discharge to streams are predicted. (Knapp-USGS)

HYDROGEOLOGY AND ENGINEERING GEOLOGY (GIDROGEOLOGIYA I INZHENERNAYA GEOLOGIYA).

Mezhdunarodnyy Geologicheskiy Kongress, XXIV Sessiya, Sektsii No 11 and 13, Simpozium No 1; Izdatel'stvo 'Nauka', Moscow, 1972. 167 p.

Descriptors: *Hydrogeology, *Engineering geology, *Groundwater, Groundwater movement, Climates, Pressure, Temperature, Permafrost,

Rocks, Rock properties, Structural geology, Water quality, Water chemistry, Geochemistry, Biochemistry, Paleohydrology, Geophysics, Seismic studies, Forecasting, On-site investigations, Conferences.
Identifiers: USSR, Hydrosphere, Taliks.

This collection contains papers prepared by the National Committee of USSR Geologists for presentation at the 24th Session of the International Geological Congress held in Montreal, Canada in August 1972. Various aspects of groundwater development are examined, including the role of climate, pressure, temperature, permafrost, and hydrogeological processes in the formation of the quality characteristics of groundwater. Papers concerned with the application of the geological sciences to engineering practice deal with the physical characteristics of rocks, on-site investigations of rock properties, present geodynamic and geologic-engineering processes, and the role of geology in physiographic conditions altered by man. A CONTRIBUTION TO THE KNOWLEDGE OF PHYSICAL AND CHEMICAL PROPERTIES OF THE GROUND WATERS IN THE SLOVENE KARST,
Yugoslav Academy of Sciences and Arts, Zagreb.
D. Novak.
Krs Jugosl Carsus Iugosl. Vol 7, No 5, p 171-188. 1971. Illus. In Czech. also.
Identifiers: Chemical properties, *Groundwater, Physical properties, *Slovene Karst, Temperature, *Yugoslavia, Hydrogen ion concentration.

During the period 1963 to 1966 observations of 10 resurgences in the Slovenian karst region were made. Water level, air and water temperature, total and carbonate hardness, pH and Cl contents were measured. The results were compared with changes in air temperature and quantity of precipitation. The necessity of intensive studies of the influence of precipitation on karst groundwaters is evident. Diagrams show the values of carbonate hardness, temperature of water and Cl content.--Copyright 1973, Biological Abstracts, Inc.

THE GROUNDWATER SUPPLY OF LITTLE CHINO VALLEY,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
W. G. Matlick, and P. R. Davis.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 67-85, (1972). 8 fig, 2 tab, 1 ref.

Descriptors: *Groundwater resources, *Groundwater mining, *Withdrawal, *Groundwater recharge, *Water table, Irrigation, Water table aquifers, Artesian aquifers, Water quality, Water utilization, Leakage, Water balance, Water levels, Hydrologic data, Arizona.
Identifiers: Little Chino Valley (Arizona).

The Little Chino Valley in central Arizona presents an interesting groundwater study as withdrawals exceed recharge. The groundwater surface is falling at about 2 feet per year over most of the area due to large irrigation development. A shallow water table aquifer overlies the artesian aquifer and receives recharge from irrigation runoff. Water quality in the artesian aquifer is excellent. Water quality in the water-table aquifer is poorer, being somewhat higher in total salts, but is suitable for most domestic and agricultural uses. Specific yield for the supply area to the artesian aquifer is 12 percent, with estimated annual recharge of 4000 acre feet and leakage from the aquifer of 2300 acre feet. Water budget and use for the basin is presented with water level and water quality data. The multiphase aquifer system is described and illustrated. (See also W73-10818) (Popkin-Arizona)

SUBSIDENCE DAMAGE IN SOUTHERN ARIZONA,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
C. A. McCauley, and R. L. Gum.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 87-94, (1972). 8 ref.

Descriptors: *Subsidence, *Damages, *Groundwater mining, *Aquifers, *Cost analysis, Economic impact, Water table, Compressive strength, Levees, Ditches, Water wells, Structures, Inspection, Hydrologic data, Arizona.

Land is subsiding over a heavily mined aquifer in south central Arizona. Subsidence damages are inventoried to help provide a basis upon which cost studies can be performed to determine actions to lessen the economic impact of these damages. Water table drawdown produces increasing loading stress by three ways: changes in bouyant support of aquifer grains, changes in water table, or both. Two types of subsidence are recognized--one-directional compression, and near surface phenomenon. Damages due to natural structures, and to man-made structures are reviewed. Agricultural damages include field releveling, ditch repair and well damage. Damages to transportational facilities include highways, bridges, pipelines, and railroads. Damages to domestic and urban structures are suggested. Questionnaires, interviews and on-site inspections were used to collect information on land subsidence damages in the study area. TRANSMISSIVITY DISTRIBUTION IN THE TUCSON BASIN AQUIFER,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
D. J. Supkow.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 113-123, (1972). 1 tab, 3 fig, 3 ref.

Descriptors: *Transmissivity, *Frequency distribution, *Hydrologic properties, *Aquifers, *Groundwater basins, Hydrologic data, Hydrologic systems, Model studies, Drainage patterns (Geologic), Alluvial aquifers, Aquifer testing, Water wells, Digital computers, Analog computers, Arizona, Arid lands.
Identifiers: Tucson Basin (Arizona), Horton's Law.

The distribution of transmissivity within the Tucson Basin aquifer, as determined by pumping tests and reviewed in the construction of a digital model of the aquifer, was not totally random in space. Data tended to be distributed normally or log-normally for biased samples of developed wells. A frequency distribution of transmissivity derived from a calibrated digital model is more nearly representative of the real world because the aquifer sample is without bias as the sample constitutes the entire aquifer. Geohydrologic setting, electric analog, and digital models of the basin are discussed. The theory of transmissivity distribution in an arid land alluvial aquifer is developed from Horton's laws of exponential relationship between stream order and drainage network parameters. It is hypothesized that there is an exponential relationship between transmissivity of an alluvial aquifer. A statistical study was made of values derived from the digital model to test the probability density function hypothesized for transmissivity. The mean value is a function of climate and drainage area. These hypotheses require further validation. (See also W73-10818) (Popkin-Arizona)
W73-10827

ELECTROMAGNETIC FIELDS ABOUT A LOOP SOURCE OF CURRENT,
California Univ., Berkeley. Dept. of Geoscience Engineering.
J. Ryu, H. F. Morrison, and S. H. Ward.
Geophysics Vol 35, No 5, p 862-896, October 1970. 31 fig. OWRR B-067-CAL (2). 14-31-0001-1878.

Descriptors: *Electromagnetic waves, Measurement, *Exploration, Geophysics, Groundwater.

Integral expressions for the electromagnetic field components produced by a horizontal loop, carrying a current Ie and placed on or above the surface of an n-layered half-space, are deduced in a form such that numerical integration can be performed easily. The expressions are free of approximations and completely general for all frequencies. They are constrained only to the uniformity of current around the transmitting loop. The resulting computed electromagnetic fields are valid for arbitrary values of the electrical parameters sigma, mu, and epsilon. The quasi-static approximation for the region above the half-space, wherein the wave equation is replaced by the Laplace equation, can be avoided. Measurements outside the loop constitute induction depth sounding. Induction depth sounding curves of field components and magnetic polarization parameters show good resolution of subsurface layering. The measurements of tilt angle and/or ellipticity of the magnetic polarization ellipse should be made to determine earth layering because of the rapidity and ease of these measurements in field operation. The radius of the loop should, in the general case, be taken into account in theoretical computations. Measurements at the center of the loop constitute central induction sounding. Central induction sounding responses are diagnostic only for layered earth models in which conductivity increases with depth. Measurement of the quadrature part of the vertical magnetic field is particularly promising. Theoretical curves for earth models consisting of one layer overlying a half-space are given for the quasi-static case for induction depth sounding, and for the nonquasi-static (general) case for central induction sounding. The response from a homogeneous, conductive, magnetic half-space with the central induction method at low frequencies reveals the feasibility of in-situ determination of static magnetic permeability. The effect of ground conductivity should be included in making the normal correction to Turam data whenever the apparent conductivity of the ground is greater than (1/1000) mhos/m.

LIBRARY U. OF I., URBANA-CHAMPAIGN

Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY3, Paper 9589, p 395-403, March 1973. 5 fig, 7 ref, append. OWRR A-039-CAL (Z) WRC Proj W-336.

Descriptors: *Groundwater movement, *Finite element analysis, *Unsteady flow, Water table, Surface-groundwater relationships, Numerical analysis.

Unsteady groundwater movement may be described using a finite element weighted residual process to solve nonlinear partial differential equations. The groundwater in an unconfined aquifer may flow either into or out of a surface reservoir. Rectangular, as well as triangular, finite elements were used in a space-time solution domain. The weighting function was equal to the shape function defining the dependent variable approximation. The results were compared in dimensionless graphs with experimental as well as other numerical data. The finite element method compared favorably with these results and was easily programmed, stable, computationally fast, rapidly convergent, and does not require constant parameters over the entire solution domain. Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Paper 9784, p 901-911, June 1973. 6 fig, 2 tab, 10 ref, append.

Descriptors: *Porous media, *Fluid friction, *Reynolds number, *Groundwater movement, *Hydraulic radius, Pores, Porosity, Fluid mechanics, Permeability, Hydraulic conductivity.

The concept of hydraulic radius of pore spaces is used to show that the square root of the permeability is the important length parameter in defining the friction factor and Reynolds number in flow through porous media. Hydraulic radius is defined by the Kozeny-Carman theory of hydraulic radius of pore space. Various porous media had different relationships between friction factor and Reynolds number. Experimental results showed a similarity to the Moody diagram used for pipe flow, with the ratio of particle mean diameter to the mean hydraulic radius of pore spaces as the third parameter. EFFECT OF DEPTH AND QUALITY OF GROUND WATER ON SOIL SALINIZATION: A FIELD STUDY WITH A FLUCTUATING WATER TABLE,
Central Soil Salinity Research Inst. Karnal (India).
A. K. Bandyopadhya.
Journal of the Indian Society of Soil Science, Vol 20, No 4, p 407-408, December 1972. 1 tab.

Descriptors: *Water level fluctuations, *Salinity, *Saline soils, *Water chemistry, *Leaching, Evapotranspiration, Salts, Water quality.
Identifiers: *India.

The effect of depth and quality of groundwater on salinization of surface soil was studied in an area with fluctuating water table and water salinity. The water table fluctuated within 107 to 300 cm below the surface soil. Salinity of the groundwater was highest when the groundwater table was furthest from the soil surface. Salinity of the surface soil was also very high during this period. The water table started rising after the onset of monsoon. Recession of water table sets in after the cessation of rainfall. Salinity of the groundwater is diluted with rainwater as the water table came nearer to the surface of the soil. At the same time rainwater also releaches the salts from the soil, thereby reducing the salinity of the surface soil. Increased evaporation from the soil surface during the summer months depresses the water table and increases the concentration of salinity of the groundwater. (Knapp-USGS)

Descriptors: *Regimen, *Soil moisture, *Brown soils, Soil profiles, Soil horizons, Soil properties, Particle size, Air temperature, Precipitation (Atmospheric), Field capacity, Nuclear moisture meters, Variability.
Identifiers: USSR, *Parkentsay River basin, Hygroscopicity.

Neutron-meter measurements were made of the water regimen of weakly leached Cinnomon-Brown soils in the Parkentsay River basin in April-July, 1965-70. Air temperature and precipitation data for the periods of observation are given together with the hydrophysical properties and particle-size distribution of the soils. Soil moisture in the upper 5-cm layer is subject to maximum variations in time, while soil moisture in the 200-cm layer has the least variability. Maximum soil moisture was observed immediately after melting of the snow when it exceeded minimum field capacity, and minimum soil moisture was observed at the end of summer when it was less than maximum hygroscopicity. THE INTERFLOW PROCESS ON SLOPING WATERSHED AREAS,
Clemson Univ., S.C. Dept. of Agricultural Engineering.
T. V. Wilson, and J. T. Ligon.
Available from the National Technical Information Service as PB-221 023, $3.00 in paper copy, $0.95 in microfiche. South Carolina Water Resources Research Institute, Report No 38, March, 1973. 58 p, 16 fig, 5 tab, append. OWRR B-008-SC (6).

Descriptors: Runoff, *Soil moisture, *Subsurface runoff, Percolation, Soil profiles, Infiltration, Movement, *South Carolina, Watersheds (Basins).
Identifiers: *Piedmont (South Carolina).

The objectives were (1) to determine principal soil factors and conditions influencing the interflow process and (2) to develop relationships leading to quantitative predictions of interflow rates and volumes based on measurable soil characteristics. A field experiment was conducted which included measurements of precipitation, surface runoff, interflow runoff, and soil moisture content on a vegetated plot. Soil moisture tension was also measured at six depths during periods of wet-soil conditions. Interflow was observed twelve times during an eighteen month period. During each event, the topsoil was at or near saturation, indicating that interflow is primarily a saturated-flow phenomenon. The B2T soil layer with a permeability one-seventh that of the topsoil restricted vertical seepage, creating a free-water condition in the topsoil during periods of excessive precipitation. A soil moisture balance procedure was used to account for water in the topsoil, and could serve as a prediction tool for interflow on the plot. Extension of prediction to other watershed areas is doubtful because of the heterogeneity of soils. The potential for increasing groundwater recharge exists by mechanically or biologically increasing the hydraulic conductivity of the restricting layer thereby diverting surface and interflow runoff to downward seepage through the profile.

INITIAL WETTING LOSSES INCURRED BY GROUND LEVEL STEREO GAGES,
Eidgenoessische Technische Hochschule, Zurich, (Switzerland). Versuchsanstalt fuer Wasserbau, Hydrologie und Glaziologie.
B. Sevruk.
Water Resources Research, Vol 9, No 3, p 759-763, June 1973. 3 fig, 2 tab, 19 ref.

Descriptors: *Rain gages, *Calibrations, *Wetting, Instrumentation, Gaging stations, Rainfall, Rainfall disposition, Water loss, Evaporation.
Identifiers: *Wetting loss (Rain gages).

The wetting losses of the rain catch of 32 galvanized ground-level storage gages with stereo orifices were investigated for the period June through September to determine a correction for the monthly rainfall totals in the basin of Montreux, Switzerland. The wetting of the gage per event as measured in the laboratory as well as in natural conditions ranged from 0.135 mm for the gage with a 15 deg inclined orifice to 0.205 mm for the gage with a 47 deg inclined orifice. The mean wetting correction of rain catch for 32 gages over a 10-year period for June through September amounted to 0.172 mm per event, or to 2.6% of precipitation catch. This percent varied only slightly in the respective years. (Knapp-USGS)

MOISTURE VARIATION AT THE SOIL SURFACE AND THE ADVANCE OF THE WETTING FRONT DURING INFILTRATION AT CONSTANT FLUX,
Technion - Israel Inst. of Tech., Haifa. Dept. of Civil Engineering.
C. Braester.
Water Resources Research, Vol 9, No 3, p 687-694, June 1973. 4 fig, 2 tab, 16 ref. USDA Grant FG-1s-287.

Descriptors: *Infiltration, *Soil water movement, *Numerical analysis, *Equations, Finite element analysis, Unsaturated flow, Hydraulic conductivity, Saturated flow, Diffusivity, Wetting.

The problem of infiltration at constant flux at the soil surface was solved approximately in an analytical closed form. The solutions are valuable when dealing with sprinkler irrigation or infiltration of rain. Infiltration into a semi-infinite soil column and infiltration into a soil column of finite length with a constant water table were considered. Analytical and numerical results were compared. The analytical solutions provide a satisfactory prediction of the moisture content at the soil surface and of the advance of the wetting front. The results are presented in a dimensionless form. MOVEMENT OF WATER VAPOR IN SOIL UNDER ISOTHERMAL CONDITIONS (DVIZHENIYE PAROV VODY V POCHVE V IZOTERMICHESKIKH USLOVIYAKH),
D. N. Onchukov, V. P. Ostapchik, and V. G. Charnyy.
Pochvovedeniye, No 5, p 79-85, May 1972. 5 fig, 10 ref.

Descriptors: *Soil physics, *Soil water movement, *Water vapor, *Isotherms, Temperature, Humidity, Moisture content, Vapor pressure, Soil physical properties, Particle size, Instrumentation, Equations.
Identifiers: USSR, Vapor density.

Isothermal movement of water vapor in soil was investigated in a sample of coarse clay taken from the upper (0-10 cm) layer of soil on a test plot of the Kalinin kolkhoz, Krasnogvardeyskoye Rayon, Crimean Oblast. Vapor sorption by the soil and vapor migration toward the soil surface are analyzed, and formulas are derived for calculating the vapor flux density as a function of either the relative humidity of the air above the soil or of the soil moisture gradient. For average soil moisture gradients observed in surface layers of nonirrigated Crimean soils, the vapor flux density under isothermal conditions is 8.28 X 0.001 kg/sq m/hr. A number of important physical characteristics of the soil are computed, including particle-size distribution, the sorption isotherm, and the dependence of the coefficients of vapor conductivity and molecular vapor flow on the soil moisture content. (Josefson-USGS)

SIGNIFICANCE OF ANTECEDENT SOIL MOISTURE TO A SEMIARID WATERSHED RAINFALL RUNOFF RELATION,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
D. L. Chery, Jr.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 385-406, (1972). 3 tab, 11 fig, 10 ref.

Descriptors: *Antecedent moisture content, *Soil moisture, *Rainfall-runoff relationships, *Streamflow, Arid lands, Peak discharge, Runoff, Hydrologic data, Watersheds (Basins), Statistical methods, New Mexico, Southwest U.S.

Numerous reports from the Southwest claim that soil moisture prior to rainfall-runoff event has no influence on the resulting flow volumes and peak rates. Runoff occurs from many storms that would not be expected to produce runoff, and an explanation lies in the occurrence of antecedent rains. This hypothesis is tested by dividing runoff events into 2 subsets--one with no rain within the preceding 120 hours, and the other with some rain within the preceding 24 hours--and to test the null hypothesis. The hypothesis was tested with rainfall and runoff data from a 40-acre Agricultural Research Service watershed west of Albuquerque, New Mexico, using the Wilcoxon's rank sum test. Various levels of statistical significance are discussed, and shown graphically, to conclude conclusively that antecedent rainfall influences runoff from a semiarid watershed. WATER VAPOR ADSORPTION BY WATER--REPELLENT SOILS AT EQUILIBRIUM,
California Univ., Riverside.
S. Miyamoto, J. Letey, and J. Osborn.
Soil Science, Vol 114, No 3, p 180-184, September 1972. 4 fig, 1 tab, 14 ref. OWRR B-072-CAL (9).

Descriptors: *Adsorption, *Water vapor, *Wettability, *Soil moisture, Moisture tension, Soil physical properties, Porous media, Surface tension, Wetting.
Identifiers: *Water-repellent soils.

Water vapor adsorption isotherms were measured in a variety of porous materials which differ in water repellency. These data were then used to calculate the heat of adsorption, integral free energy of adsorption, and check the applicability of Adamson's method in porous media. No specific trend or differences which could be uniquely related to water repellency were found on the amount adsorbed per unit area, the shape of adsorption isotherm, the heat of adsorption and the integral free energy of adsorption. The differences in initial vapor adsorption levels under the controlled temperature did not influence the value of the surface tension. The apparent independence of water vapor adsorption on the differences in surface tension of porous media implied that mechanisms of wettability and repellency of porous media may operate at the portion which is beyond vapor adsorption or masked by other soil properties. AN ANALYSIS OF STREAM TEMPERATURES IN LOUISIANA,
Geological Survey, Baton Rouge, La.
A. J. Calandro.
Louisiana Department of Public Works Technical Report No 6, 1973. 16 p, 4 fig, 3 tab, 9 ref.

Descriptors: *Water temperature, *Streams, *Louisiana, Basic data collections, Aquatic environment, Environmental effects, *Solar radiation, Air temperature, Seasonal, Diurnal, Monthly, Depth, Deep water, Physical properties, Thermal properties, Variability, Correlation analysis.
Identifiers: Shade.

In Louisiana air temperatures during the summer months are approximately the same throughout the State; water temperatures of streams, however, become progressively cooler from the north to south. During the winter months air temperatures are cooler in the northern part of the State than in the central or southern parts, and water temperatures are about 5 deg F (3 deg C) cooler. A method of analysis developed by M. R. Collings was used to obtain midmonthly temperatures from miscellaneous water-temperature data from 71 sites. When compared to long-term daily temperature stations, the method works very well for Louisiana streams. Monthly temperature duration, average monthly temperatures, and monthly extremes are shown for nine stations throughout the State. These stations are located on the larger streams and rivers. The major natural factors affecting stream temperatures in Louisiana are solar radiation, shade, air temperature, and stream depth. The most important of these is solar radiation. (Woodard-USGS)

A FINITE ELEMENT SOLUTION FOR TWO--DIMENSIONAL DENSITY STRATIFIED FLOW,
Water Resources Engineers, Inc., Walnut Creek, Calif.
I. P. King, W. R. Norton, and G. T. Orlob.
Available from the National Technical Information Service as PB-220 967, $3.00 in paper copy, $0.95 in microfiche. Final report, March 1973. 80 p, 16 fig, 3 tab, 32 ref. OWRR C-2052 (3670) (1).

Descriptors: Fluid mechanics, Flow, *Density stratification, Computer models, *Computer programs, *Stokes law, *Diffusion, *Advection, Turbulent flow, Weirs, Unsteady flow, Viscosity, Lakes, Water properties, *Stratified flow.
Identifiers: *Finite Element Method, *Two-dimensional flow, Turbulent exchange coefficient, Nonlinear equations.

A finite element formulation is presented for solution of problems of two-dimensional flow (vertical elevation). The equations describing the phenomena are assumed to be the two-dimensional version of the Navier Stokes Equations coupled to the advection-diffusion equation for variations in density. In these nonlinear equations the conventional coefficient of viscosity is replaced by a turbulent exchange coefficient when flow is in the turbulent range. The Galerkin method of weighted residuals is described for the finite element method and the use of the Newton-Raphson iterative scheme is explained with respect to incorporation of nonlinear terms in the solution procedure. The result of this derivation is a set of nonlinear simultaneous equations, and implications and programming considerations are discussed. Examples of both constant density (homogeneous) flow and density stratified flow over a submerged weir are included. These examples are compared to experimental results and their accuracy assessed.

WATER RESOURCES OF MOUNTAIN LAKES IN SOVIET CENTRAL ASIA (VODNYYE RESURSY GORNYKH OZER SREDNEY AZII),
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
V. N. Reyzvikh, A. M. Nikitin, and N. M. Abramenkov.
In: Vodnyy balans territorii Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 62 (77), p 17-29, Leningrad, 1972. 1 fig, 7 tab, 7 ref.

Descriptors: *Water resources, *Lakes, *Lake morphology, *Lake morphometry, *Mountains, Elevation, Volume, Areal, Water balance, Water types, Water quality, Water chemistry.
Identifiers: USSR, *Soviet Central Asia, Lake classification, Mineralization.

There are 7,172 lakes in Soviet Central Asia and the total water surface area is 10,250 sq km. Of the estimated 50.38 billion cu m of water in the lakes (determined to within plus or minus 5%-10% of true values), 20.3 billion cu m is freshwater, 26 billion cu m is brackish water, and 4.08 billion cu m is water of unknown quality. The volume of water in five of the largest lakes (Iskanderkul', Yashil'kul', Sarezskoye, Karakul', and Sonkul') is 43.2 billion cu m, or 86% of the total volume of water in mountain lakes of the region. FOOD SUPPLY OF ROACH UNDERYEARLINGS RUTILUS RUTILUS (L.) IN THE MOZHAISKII RESERVOIR (IN RUSSIAN),
Moscow State Univ. (USSR). Dept. of Ichthyology.
V. A. Grigorash, V. D. Spanovskaya, and T. V. Lebedeva.
Vopr Ikhtiol. Vol 12, No 3, p 504-512. 1972. Illus.
Identifiers: *Food (Fish), *Mozhaiskii Reservoir, *Roach, Rutilus-Rutilus, Underyearlings, USSR.

The daily rhythm of feeding, diet and growth rate for roach juveniles at different stages of development was investigated in the Mozhaiskii Reservoir during the first 10 yr of its existence. The hydrological regime and fish populations varied during this period. The daily ration for larvae during years with a good food supply varied from 21.7 to 26.4%, and for frys it was 15% of body weight. When food was scarce the indices were 12.8-14.6% and 7.9% respectively. The average daily weight increase during the larval period in good years was 13-20%, in bad years 5-9%.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Age groups (Fish), Feeding (Fish), Lakes, Lucioperca-Lucioperca, *Pike perch, *Pskov-Chudskoe Lake, Roach, Stint, USSR.

The diet and intensity of feeding were studied for pike perch in different regions of the Pskov-Chudskoe Lake during different seasons of the first 2 yr of life. Variations were determined by the abundance and accessibility of food. In the summer of the second yr prey of the same age as the pike-perch became inaccessible because of size. During the transfer to fooding on a new generation of prey, the index of stomach fullness decreased substantially. Stint was the most valuable food, compared to roach and perch.--Copyright 1973, Biological Abstracts, Inc.

Pol Arch Hydrobiol. Vol 19, No 1, p 123-150, 1972. Illus. English summary.
Identifiers: Ecological studies, Small water bodies, Terminology, *Food webs, *Ecosystems.

A new terminology for discussing ecosystems is introduced and illustrated by complex data from 3 different temporary pools. Cycles of O2, CO2 and N, as well as food webs networks were used as criteria. A conclusion emerges that the widely used term 'ecosystem' is not quite precise. A new terminology is suggested, referring to the close or open character of the cycle of metabolism in a reservoir.--Copyright 1973, Biological Abstracts, Inc.

SOME ECOLOGICAL ASPECTS OF A NESTING COLONY OF HERONS,
Auburn Univ., Ala.
C. A. McDonald.
Ph D Dissertation, August 27, 1971. 118 p, 11 fig, 17 tab, 111 ref. OWRR A-010-ALA (2).

Descriptors: *Eutrophication, *Swamps, *Environmental effects, *Wading birds, *Georgia, Algae, Aquatic plants, Limnology, Aquatic productivity, Nutrients, Nitrates, Phosphates, Productivity.
Identifiers: Duckweed, *Herons, *Anhingas, Egrets.

A swamp in Clay County, Georgia, was studied to determine the ecological effects of a nesting colony of herons and anhingas. A similar swamp without herons was used for comparison. Within the colony area the understory was reduced or dying even. Larger numbers of dead limbs were found in the trees. These differences indicate a toxic effect on the vegetation by the excrements of the herons. Duckweed, forming a dense layer throughout the colony, was replaced during the summer by an algal mat composed primarily of Euglena. Neither the duckweed nor the algal mat was present in the swamp lacking the herons. Levels of nitrogen and phosphorus were higher in the swamp with the herons. The concentrations increased with an increase in the size of the colony and decreased with an increase in distance from the colony. (Knapp-USGS)

DATA ON SELECTED LAKES IN WASHINGTON, PART I,
Geological Survey, Tacoma, Wash.
M. R. Collings.
Geological Survey open-file report, 1973. 179 p, 86 fig, 1 tab.

Descriptors: *Lakes, *Limnology, *Thermocline, *Water quality, *Washington, Lake morphology, Data collections, Water temperatures, Thermal stratification, Dissolved oxygen, Mixing, Water circulation, Water pollution sources, Nutrients, Water level fluctuations, Precipitation (Atmospheric), Seasonal, Inflow, Discharge (Water).

Physiographic, physical, chemical, and floral characteristics are described for 22 lakes in western Washington State. Most of the lakes are used primarily for recreation, have origins related to continental and alpine glaciation, and are in areas underlain by glaciofluvial and (or) volcanic deposits that are covered by soils grading from gravel to clay. The cover of the lake basins ranges from conifer forests with some deciduous trees to grasslands and urban developments. The lakes range in surface area from 0.27 to 49.4 million square feet, in volume from 3.34 to 2,624 million cubic feet, in mean depth from 11.1 to 70.8 feet, and maximum depth from 20 to 117 feet. Generally the water-temperature profiles of the lakes show total mixing during the winter, with a uniform temperature-depth profile, and, beginning in the spring, thermal stratification which reaches a maximum during the summer, after which the mixing cycle begins again in the late fall. Profiles of the dissolved oxygen concentration in most of the lakes have the same relative shape as the temperature profiles. However, during the summer eight of the lakes also developed a pronounced positive heterograde zone of oxygen supersaturation in the central part of the depth profile. In several lakes, mineral and nutrient constituents increased from the epilimnion during summer stratification. Lake-level fluctuations reflect the precipitation pattern in western Washington. (Woodard-USGS)

A HIGH-MOUNTAIN LAKE (VORDERER FINSTERTALER SEE, KUEHTAI, AUSTRIA) AS A MODEL OF ENERGY FLOW THROUGH A FRESHWATER ECOSYSTEM, (IN GERMAN),
Innsbruck Univ. (Austria). Inst. of Zoology.
R. Pechlaner, G. Bretschko, P. Gollmann, H. Pfeifer, and M. Tilzer.
Verh Dtsch Zool Ges. 65, p 47-56, 1971. Illus. English summary.
Identifiers: Animals, *Austria, Biomass, Ecosystem, Energy, Flow, Lakes, Model studies, *Mountain lakes.

The extreme character of environmental conditions in lakes above timber line favors ecological research in such ecosystems both by reducing species diversity and by facilitating the analysis of the effects of abiotic factors on the species present. The changes were monitored in physical and chemical conditions and plant and animal life in Vorderer Finstertaler See since 1968. With the exception of benthic bacteria all trophic levels were studied for biomass and production rate of the dominant species. The results attained so far are summarized and the main paths of energy flow through the ecosystem are shown and discussed.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Water circulation, *Stratified flow, *Lakes, Lake morphology, Winds, Limnology, Model studies, Mathematical models, Thermocline, Epilimnion, Hypolimnion, Diffusion, Eddies, Analytical techniques, Forecasting, Wind velocity, Lake morphometry.
Identifiers: Lake bottom topography.

Observations of stratified lakes suggest that during steady wind periods they may be modeled by considering the lake to be made up of two homogeneous layers, each with different densities and eddy diffusivities with the interface between the two layers being located at the thermocline. The position of the thermocline and the velocities in both layers are calculated from an asymptotic solution of the shallow lake equations when the Ekman number in the epilimnion (upper layer) is of order one, but the rato of hypolimnion (lower layer) to epilimnion eddy diffusivities is much less than one. Large differences in the thermocline shape and the velocities occur between the solution for uniform wind stress and the one for unit order wind stress gradients. For the latter solution the hypolimnion eddy diffusivity magnitude and the bottom topography have a large and important effect. (Woodard-USGS)

NATURE OF LARVAL AND JUVENILE GROWTH OF SOME FRESHWATER FISH AT DIFFERENT STATES OF DEVELOPMENT, (IN RUSSIAN),
Kazan State Univ. (USSR). Dept. of Vertebrate Zoology.
V. A. Kuznetsov.
Vopr Ikhtiol, Vol 12, No 3, p 479-489, 1972. Illus.
Identifiers: Bream, Custacea, *Fresh water fish, *Juvenile growth, *Larval growth, Perch, Pike, Plankton, Roach, Zooplankton.

On the basis of observations of bream, roach, perch, pike-perch and pike juveniles and larvae at different stages of development, 5 periods of

growth characterized by growth intensity and associated with diet were differentiated. There were 2 critical periods for the growth of carp and perch larvae: after yolk resorption and transfer to external food and during the transfer from a diet of small zooplankton to crustaceous zooplankton. During these periods the intensity of larval growth decreased. The second critical period was not applicable to pike.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Biological indices, Food (Fish), Indices, *Roach, Rutilus-Rutilus, *Seasonal.

The dynamics of linear growth, weight increase, condition, fatness, relative weight of the liver, and maturity of a single age group from April to Oct. in different years were investigated. The indices depended on food supply. Variation in the first 4 categories was unstable and depended mainly on fattening conditions during a given year. Variation in the hepatic index was consistent and the coefficient of maturity was the same in different years. Evidently variations in these indices are determined to a large degree by endogenous factors. A sharp increase in food supply during the spring and feeding exclusively on animal food, followed by a sharp deterioration of feeding conditions during a single spawning period led to elimination of some of the eggs. This resulted in a correspondence between the number of developing eggs and the available resources.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: Cololabis-Saira, Distribution patterns (Fish), Ocean, Pacific Ocean, *Saury (Spawning), *Sea of Japan, Spawning, Temperature.

Spawning occurs under about the same hydrological conditions throughout the year. Spawning areas change with the temperature of the water. During the winter the northern portion of the East China Sea and waters off the southern shores of Kyushu, Shikoku and Honshu are areas of group spawning for saury from the Sea of Japan and Pacific Ocean. In autumn the center moves south, in the spring to the north. Saury inhabiting the Sea of Japan and the waters of East Japan belong to the same stock.--Copyright 1973, Biological Abstracts, Inc.

DESICCATION INJURY IN MOSSES: II. THE EFFECT OF MOISTURE STRESS ON ENZYME LEVELS,
Manchester Univ. (England). Dept. of Botany.
G. R. Stewart, and J. A. Lee.
New Phytol. Vol 71, No 3, p 461-466. 1972. Illus.
Identifiers: Acrocladium-cuspidatum, Dehydrogenase, Desiccation,*Enzymes, Glutathione, Glyceraldehyde, Moisture, *Mosses, NADP, Oxidation, Phosphates, Photosynthesis, Shoots, Sulfhydryl.

The effects of desiccation on the activity of several enzymes from Acrocladium cuspidatum were investigated; with the exception of glyceraldehyde 3-phosphate dehydrogenase prolonged desiccation had little effect on the enzymes studied. The response of the NADP+-dependent glyceraldehyde 3-phosphate dehydrogenase to sulphydryl compounds changes during desiccation; when extracted from desiccated shoots it showed a 6-20 times stimulation of activity in the presence of reduced glutathione, that from fresh shoots showed only a 2-fold stimulation. The effects of glutathione on the enzyme's activity were examined in species with varying resistance to desiccation. It is suggested that the decline in photosynthesis during desiccation may be explained in part by the oxidation of sulphydryl residues essential for the catalytic activity of the NADP+-glyceraldehyde 3-phosphate dehydrogenase. MIGRATION OF STURGEON (ACIPENSERIDAE) IN THE VOLGA DURING WINTER, (IN RUSSIAN),
Tsentralnyi Nauchno-Issledovatelskii Institut Osetrovogo Khozyaistva, Astrakhan (USSR).
A. V. Pavlov, and A. P. Slivka.
Vopr Ikhtiol. Vol 12, No 3, p 584-588. 1972.
Identifiers: Acipenseridae, Crabs, Invertebrates, Leech, *Migration (Spawning), Parasites, *Sturgeon, *Volga River, Winter.

Studiies of great sturgeon and Russian sturgeon from 1968-70 in different parts of the Volga confirmed the existence of a spawning migration and post-spawning downstream migration during the winter. Under the ice great sturgeon migrated in greater numbers than Russian sturgeon. As opposed to other seasons, the intensity of movement and downstream migration was substantially weaker. Downstream migrants led an active life in wintering areas. As a rule they ate fish, crabs and other bottom-dwelling invertebrates. The rate of infestation with parasites, such as leeches, was lower than in other seasons. Resorption of the eggs during winter in some specimens indicated disorders in the normal process of gonad maturation which developed under new conditions.--Copyright 1973, Biological Abstracts, Inc.

ON THE GEOTROPIC GROWTH OF THE ROOT, (IN GERMAN),
L. Kutschera-Mitter.
Beitr Biol Pflanz. Vol 47, No 3, p 371-436, 1971. Illus. English summary.
Identifiers: Evaporation, *Geotropic growth, Humidity, *Root system, Temperature, Water uptake (Plants).

The root systems of perennial plants, being dependent on the changes of soil temperature, are often developed in 3 growth zones, showing varied geotropical behavior in these. Experiments were made with seed plants of various species, and the influence of different temperatures and of different relative air humidity on the geotropic behavior of the plant and the resulting changes in the tissues were observed. The importance of the root cap on geotropism was also investigated, as well as the influence of the centrifugal force. In order to determine differences in transpiration, the temperatures on the upper and lower sides of horizontally placed moist objects were measured. Previous explanations of geotropism, as the statolith theory or the theory about growth substances are incompatible with the shortness of the induction period. Neither do they explain the great influence of temperature changes on geotropic growth. According to field observations and experiments, the reason for positive geotropic growth of the root is the growth of the elongation zone is dependent on external water and water molecules escape faster on the upper side, and the slime of the root cap moves downward so that the cells of the upper side come in contact with the air earlier than those of the lower side. The faster escape of the vapor from the upper side caused by gravity leads to a greater easing of tension of the cell walls, and to cooling due to evaporation. That is why the absorbing power of the cells and the formation of condensed water are greater there than on the lower side. In consequence elongation and water uptake of the cells of the upper side are greater. The difference increases with changes in temperature and relative humidity.--Copyright 1973, Biological Abstracts, Inc.

DEPENDENCE OF BLACK FLY LARVAE DISTRIBUTION ON THE OXYGEN CONTENT IN THE WATER, THE SPEED OF FLOW AND THE NUTRITIVE VALUE OF WATER STREAMS, (IN RUSSIAN),
Ivanovskii Gosudartsvennyi Meditsinskii Institut (USSR). Dept. of Biology.
L. A. Ivashchenko.
Med Parazitol Parazit Bolezn. Vol 41, No 2, p 217-220, 1972. English summary.
Identifiers: *Black fly larvae, Distribution, Larvae, Nutritive value, *Oxygen, Streams.

Dispersal of larvae of black flies of different species depends upon the extent of water saturation with O2, rate of flow, biological requirement of

water in O2, and nutritive value of the water stream. The nutritive value of the stream was determined as the value resulting from multiplying by the rate of flow of the water. Species selectivity by all these values characterizing the biotope was observed. The definite correlation between the density of larvae, rate of flow, and nutritive value of the stream was observed only in biotopes of similar types or in different parts of the same water stream.--Copyright 1973, Biological Abstracts, Inc.

SCALE STRUCTURE OF THE AMUR KETA ONCORHYNCHUS KETA (WALB.) AS AN INDEX OF GROWTH AND LIVING CONDITIONS DURING THE FRESHWATER STAGE OF LIFE, (IN RUSSIAN),
Tikhookeanskii Nauchno-Issledovatelskii Institut Rybnogo Khozyalistva i Okeanografii, Khabarovsk (USSR). Lab. of Anadromous Salmon.
Yu S. Roslyi.
Vopr Ikhtiol. Vol 12, No 3, p 532-544. 1972. Illus.
Identifiers: *Amur Keta, Growth (Fish), Oncorhynchus-Keta, *Scale structure (Fish).

The effects of the river current on the growth of Amur keta during the early part of the first year of life was considered. Differences in the number of sclerites in the first annual growth zone of the scale suggested a link between keta growth in the first year and living conditions during the freshwater period. In years of low flow rates during the downstream migration period, keta juveniles grew better in the rivers and brackish littoral waters.--Copyright 1973, Biological Abstracts, Inc.

SEASONAL FLUCTUATIONS IN THE WATER CONTENT OF VARIOUS PLANT FORMATIONS IN HAUTE-ARDENNE,
Louvain Univ. (Belgium). Laboratoire d'Ecologie Vegetale.
C. Renard.
Mem Soc R Bot Belg. 5, p 5-139. 1971.
Identifiers: *Beech, *Belgium (Haute-Ardenne), Bogs, Forests, Meadow, Norway, Regulation, *Seasonal, *Spruce, Yield.

Four plant communities (beech forest, Norway spruce plantation, meadow, bog) were studied in the 'Plateau des Tailles' (600 m above sea level, Belgian 'Haute-Ardenne'). The 4 communities were studied from a phenological point of view. At the same time, samples were collected in the beech forest and in the spruce plantation, from Jan. 1965 to May, 1966. From these, trends of water content variations during the year (for different plant parts) and dry weight (for some plant parts, only) were obtained. In both cases, the average water weight was the greatest during the winter, and the smallest during the period of active growth. From a detailed analysis of the variations of that parameter, it can be concluded that the older plant parts (heartwood) are water refilled during the winter. The meadow and the bog were studied from June, 1966 to Oct., 1967. Mean dry biomasses (tons/ha) and water contents were estimated. Water content was the greatest in winter, and the smallest during active growth. Dry biomass and water contents of the 4 stands were calculated at 4 characteristic times of the year. The differences between the annual maximum and minimum water contents, expressed in water height, is 2.5 mm for the meadow, 3.4 mm for the beech forest 6.4 mm for the spruce plantation, and 12.4 mm for the bog vegetation. The times at which the maxima and minima were obtained emphasize the importance of the bog for water yield regulation.--Copyright 1973, Biological Abstracts, Inc.

INSECT-PRODUCTION OF BLOOD-SUCKING MOSQUITOES CULEX PIPIENS L. AND ALLOTHEOBALDIA LONGIAREOLATA MACQ. IN SHOWER INSTALLATIONS UNDER CONDITIONS OF A HOT CLIMATE, (IN RUSSIAN),
V. L. Kulanin.
Med Parazitol Parazit Bolezn. Vol 40, No 5, p 622-623. 1971. English summary.
Identifiers: Allotheobaldia-Longiareolata, Climates (Tropical), Culex-Pipiens, *Insect production, Installations, *Mosquitoes.

Additional water bodies suitable for breeding consist of showers (barrels, tanks), refuse and sewer pits, water supply manholes and sewer systems, and temporary lavatories. These additional water bodies should be regularly examined, since they are sometimes the main sources of A. longiareolata and C. pipiens mosquitoes in towns with hot climates. Recommendations are given for private persons and organizations to prevent mosquito breeding in such water bodies.--Copyright 1973, Biological Abstracts, Inc.

BREEDING PLACES OF MOSQUITOES IN THE AREA OF THE OERTZE LOWLAND (LUENBURGER HEIDE): 1. BREEDING PLACES OF AEDES PUNCTOR KIRBY,
E. Ising.
Zool Beitr. Vol 17, No 2/3, p 435-456. 1971. Illus.
Identifiers: Aedes-Punctor, *Breeding, Lowlands, *Mosquitoes, Places, *Germany (Oertze Lowland).

In 1969 and 1970, 30 breeding waters of Aedinae, all containing A. punctor, were observed in the Oertze Lowland (West Germany). Of these, 7 waters contained only A. punctor, while 23 others contained 8-90% A. punctor larvae in association with A. excrucicans, A. annulipes, A. cinereus and/or A. communis. The breeding waters are precipitation pools or puddles existing from several wk to about 4 mo. A considerable number of the waters are very similar to peat waters with reference to location, meterological and geophysical conditions of the location, depth, temperature and composition of the water and vegetation. Analysis of breeding behavior of A. punctor in the investigated area and data from literature show that its acidophilia is not species-specific and is not suitable for characterization of its preference behavior. Classification of A. punctor as a tyrphophilic species (living on peat) is supported by occasional authochthonous forest populations.--Copyright 1973, Biological Abstracts, Inc.

AN EVALUATION OF THE POSSIBLE EFFECTS OF WATER DIVERSION OF THE CONNECTICUT RIVER ON THE BIOLOGY OF ANADROMOUS FISH IN THE RIVER,
Massachusetts Univ., Amherst.
J. A. McCann, and E. R. McGrath.
In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area, Massachusetts Water Resources Research Center, Publication No. 25, 1973. Appendix C, 14 p, 47 ref. OWRR C-2169 (No.3377) (1).

Descriptors: *Diversion, *Environmental effects, *Anadromous fish, Fish migration, *Pumped storage, *Connecticut River, *Inter-basin transfers.
Identifiers: *Flood water diversions, American shad, Atlantic salmon, Sea lamprey, Blueback herring, Alewife.

The possible effects of the flood water diversions, including the operation of a pumped storage facility on Northfield Mountain, on anadromous fish in the Connecticut River is discussed. The fish under consideration are the American shad, blueback herring, alewife, sea lamprey, and Atlantic salmon. The influences and relationships involved are very complex but two key factors are water flow and temperature. In particular, the upstream migration of the American shad and the Atlantic salmon are closely related to spring and fall flood water conditions. These flood flows would be altered by the proposed diversions but probably not enough to affect the migration. On the other hand increased diversions or diversions during normal flows may have significant effects. Also, in the vicinity of the intakes, there may be problems due to the periodic reversal of flows and the loss of fish into the intakes. It is recommended that studies be made at the existing facilities at Holyoke Dam to relate flood flow reduction and other factors to the passage of fish over the dam. (See also W73-10726). A PURIFIED TEST DIET FOR THE EEL, ANGUILLA JAPONICA,
Freshwater Fisheries Research Lab., Tokyo (Japan).
S. Arai, T. Nose, and Y. Hashmioto.
Bull Freshwater Fish Res Lab Tokyo. Vol 21, No 2, p 161-178. 1971. Illus.
Identifiers: Anguilla-Japonica, *Diets, *Eel, Purified test diet.

Attempts were made to establish a purified test diet which fulfills the nutritional requirements of eel, by modifying the test diet devised by Halver (1957) for salmoids. As fat source, corn oil, cod liver oil and their mixture in 2:1 were tested at a 12% level in the diet. The mixed oil was the most favorable for growth and cod liver oil the least. Eels fed on a corn oil diet which is scanty in linolenic acid showed a fatty acid pattern characterized by the absence of highly unsaturated fatty acids supposed to be derived from linolenic acid. The level of mineral mixture was an important factor for growth. The eel, kept on diets either containing 1% mineral mixture or lacking it, showed cessation of growth in 2 wk, followed by both loss of their body weight and high mortality. All the dead fish revealed scoliosis and lordosis. The higher the level of mineral mixture, the better was the growth. At a level as high as 8%, the body weight gain was maximum. As supplement, a combination of 0.5% L-tryptophan and 1% L-cystine was much better than that of 0.5% L-tryptophan and 1% DL-methionine. A further addition of 0.5% L-threonine, however, depressed growth remarkable, suggesting the importance of amino acid balance in protein nutrition of eel. A purified test diet consisting of casein 54, gelatin 15, dextrin 8, corn oil 6, cod liver oil 3, cellulose power with vitamin mixture 6, mineral mixture 7, L-tryptophan 0.5, L-cystine 1 and water 200 maintained the much improved growth for 14 wk without inducing any abnormality in eels.--Copyright 1973, Biological Abstracts, Inc.

DESERT PRODUCTIVITY AND ITS DYNAMICS IN CONNECTION WITH METEOROLOGY, (IN RUSSIAN),
A. P. Fedoseev.
Probl Osvoeniya Pustyn'. 3. p 3-9. 1972. Illus. English summary.
Identifiers: Computers, *Deserts, Dynamics, Forecasting, Meteorology, Productivity, Range, Yield.

Prognostication of range plant yield includes forecast of meteorological and biological phenomena. Biological regularities are, mainly, expressed by nonlinear correlation. Thus, together with methods of statistic forecast in agrometeorological forecasting, the nonlinear correlation should be used. Of great help is the utilization of computers and programmed development of forecasting models. Prospective yield prognostication is possible with the mathematical model 'weather yield,' the structure of which expresses correlation between hydrometeorological conditions and vital activity of plants-photosynthesis, respiration, growth and development.--Copyright 1973, Biological Abstracts, Inc.

COMPARATIVE STUDY OF THE PLAGIOTHECIACEAE OF BELGIUM WITH REGARD TO CERTAIN FACTORS INFLUENCING THEIR WATER RELATIONSHIPS WITH THE ENVIRONMENT, (IN FRENCH),
Namur Univ. (Belgium). Dept. of Botany.
J. Lefebvre.
Bull Soc R Bot Belg. Vol 103, No 1, p 63-70. 1970. Illus. English summary.
Identifiers: *Belgium, Isopterygium, *Osmotic potential, *Plagiothecia ceae, Plagiothecium-Curvifolium, Plagiothecium-Denticulatum, Plagiothecium-Denticulatum-Var-Denti, Plagiothecium-Denticulatum-Var-Undul, Plagiothecium-Undulatum, Sap, Taxonomy, Turgidity, Vacuolar, Water loss.

The principal species of Belgian Plagiothecia ceae were studied with respect to 4 characters related to water economy: osmotic potential of vacuolar sap, relative turgidity, water-content of fresh samples, and rate of water-loss. Data on water relations is used to supplement other data concerning the taxonomy of Isopterygium and Plagiothecium, P. undulatum and other Plagiothecium s.s., and P. laetum and P. curvifolium. Similarity of osmotic potential parameters justifies retention of P. denticulatum var. denticulatum and var. undulatum in the same species.--Copyright 1973, Biological Abstracts, Inc.

DENSITY GRADIENT CENTRIFUGATION AS AN AID TO SORTING PLANKTONIC ORGANISMS: I. GRADIENT MATERIALS,
Marine Biological Lab., Woods Hole, Mass.
R. A. Bowen, J. M. St. Onge, J. B. Colton, Jr., and C. A. Price.
Mar Biol (Berl). Vol 14, No 3, p 242-247. 1972. Illus.
Identifiers: *Centrifugation (Density gradient), Fish eggs, Invertebrates, Marine organisms, *Plankton, Salpa, *Sorting, Zooplankton.

Fish eggs and larvae can be separated from invertebrate zooplankton by centrifugation in gradients of sucrose or silica. Preserved samples of invertebrate zooplankton, fish eggs, and fish larvae, representing a typical assortment of marine plankton, were layered over linear gradients of 25 to 60% w/w (weight) sucrose or 0 to 15% w/w silica (as Ludox AM) in 100 c3 swinging buckets and centrifuged for 1 hr at 1000 rpm (revs per min). In sucrose gradients, the invertebrate zooplankton were confined to the 2 ends of the gradient, while 85% of the fish eggs were recovered from an intermediate zone (27.5 to 55% w/w). In Ludox AM, the fish eggs banded in a narrow region between 2 and 3% w/w, while fish larvae banded at the bottom of the gradient between 10 and 14% w/w. Of the 6 dominant classes of zooplankton, only Salpa overlapped appreciably with the fish larvae. Of the gradient materials tested, Ludox AM offers the most advantages; sucrose may also be useful for subfractionation. Gradients of sodium bromide and dextran have been found to be totally unsuitable.--Copyright 1973, Biological Abstracts, Inc.

STUDIES ON THE CARP CULTURE IN RUNNING WATER POND: V. OXYGEN SUPPLY AND CONSUMPTION IN THE FISH POND AND ESTIMATION OF THE AMOUNT OF HARVESTABLE FISH IN A POND, (IN JAPANESE),
Freshwater Fisheries Research Lab., Tokyo (Japan).
K. Chiba.
Bull Freshwater Fish Res Lab Tokyo. Vol 21, No 2, p 151-160. 1971. Illus. English summary.
Identifiers: *Carp, Culture, Fish, Harvestable fish, *Oxygen, Ponds.

Oxygen consumption rate of carp (50-130 g) in active condition was measured under various water temperatures (16-30 C). The relation between oxygen consumption rate (Y) and water temperature (X) is expressed by the following formula: $\log Y = \pm 0.0307X + 1.4072$. Oxygen consumption rate of pond water varied from 0-0.24 cc/1. No clear diurnal changes were observed. Oxygen values obtained from other areas are compared. Seasonal variations and the ratio of average fish weight at harvest to that at maximum temperature are indicated. (See also W72-07700)--Copyright 1973, Biological Abstracts, Inc.

METHODS OF MEASURING MASS WASTING; REVIEW AND CRITIQUE,
Portland State Univ., Oregon.
L. W. Price, and C. S. Alexander.
Proceedings of the Association of American Geographers, Vol 3, p 135-139, 1971. 34 ref.

Descriptors: *Mass wasting, *Erosion, *Slopes, Movement, Measurement, Analytical techniques, Erosion rates, Creep, Avalanches, Landslides, Mudflows, Rockslides, Mass transfer, Strain gages, Instrumentation.
Identifiers: *Mass wasting meter, Radioactive devices, Young pit, Vertical velocity column.

The use of more precise and better controlled methods of measuring mass wasting is presented. In situ rocks, small pins, dowels, and cone targets are better devices for measuring surface movement than are wooden stakes. Methods for monitoring movement with depth include: the Young pit, vertical velocity column, mass wasting meter, radioactive devices, and strain gauges. The latter two show the greatest promise. The value and significance of field measurements in geomorphology are limited by the techniques used. (Woodard-USGS)

THE SIGNIFICANCE OF WAVE PARAMETERS IN THE SORTING OF BEACH PEBBLES,
Unit of Coastal Sedimentation, Taunton (England).
R. Gleason, and P. J. Hardcastle.
Estuarine and Coastal Marine Science, Vol 1, No 1, p 11-18, January 1973. 6 fig, 1 tab, 19 ref.

Descriptors: *Sediment sorting, *Beaches, *Gravels, *Surf, *Littoral drift, Waves (Water), Sediment transport, Sedimentation, Particle size, Sedimentology.
Identifiers: Chesil Beach (England).

On Chesil Beach, Dorset, England, longshore drift sorting is dependent on the angle of swell approach and wave height. The vertical sorting is dependent on the wave frequency and wave height. The processes are reflected most significantly in the mean short diameters of the pebbles. Chesil Beach is a graded shingle structure approximately 18 km long with mean pebble long diameter increasing from 1.5 cm at West Bexington to 5.5 cm at Chesilton. The grading is linear over much of its

length but increases exponentially over the eastern 5 km. In the area under discussion the whole of the beach above low water mark is composed of material of pebble size or above although finer fractions are sometimes present at or below low water mark. (Knapp-USGS)

THE EVOLUTION OF LEWES HARBOR,
Delaware Univ., Newark. Dept of Geology.
J. C. Kraft, and R. L. Caulk.
Available from NTIS, Springfield, Va. 22151 AD-753 860. Price $3.00 printed copy; $0.95 microfiche. Delaware University College of Marine Studies Technical Report No 10, November 1972. 58 p, 22 fig, 14 ref. ONR-GP Contract N00014-69-A0407.

Descriptors: *Coasts, *Harbors, *Sedimentation, *Sediment transport, *Delaware, Erosion, Sedimentation rates, Breakwaters, Sand spits, Geomorphology, Environmental effects, Ocean currents, Shores, Littoral drift.
Identifiers: *Lewes Harbor (Del).

Lewes Harbor, Delaware, is being destroyed by silting and erosional processes. In addition, the effectiveness of the Harbor of Refuge has become more limited, in part by processes in coastal change and in part by changes in the nature of shipping patterns. Short term projection of changes in coastal morphology indicates that Cape Henlopen will join the inner breakwater of Lewes Harbor in the short term future. With this event, the complete silting of the inner harbor should occur. Ultimately, over the next century, the present inner harbor of Lewes should become a shallow tidal flat bordered by a coastal marsh. Over the long term (3 to 500 years) period a contining erosion of the Atlantic shore will cause the Atlantic shoreline area to merge with the inner Delaware breakwater. Further intrusion of man into this area may drastically alter these predictions. (Woodard-USGS)

FATE OF SUSPENDED SEDIMENT DURING BASIN RECHARGE,
Southwestern Great Plains Research Center, Bushland, Tex.
D. W. Goss, S. J. Smith, B. A. Stewart, and O. R. Jones.
Water Resources Research, Vol 9, No 3, p 668-675, June 1973. 2 fig, 4 tab, 28 ref.

Descriptors: *Suspended load, *Artificial recharge, *Recharge ponds, Sedimentation, Silts, Silting, Desilting, Infiltration, Pit recharge, Tracers, Clays.

Suspended sediment was tagged with the radioisotope Cs-134 to determine the extent of its movement into materials underlying recharge basins and to aid in evaluating the effect of its accumulation on infiltration rates and the basin life. When openings of naturally occurring large pores were allowed to remain at the basin surface, 50% of the sediment moved deeper than 18 inches. However, when large-pore openings at the surface were destroyed by cultivation, over 90% of the suspended sediment was retained in the upper 1 inch. Most of this sediment could easily be removed. The suspended sediment that moved deeper than about 0.15 inch (the depth removed after each recharge cycle) did not noticeably reduce infiltration rates in an experimental basin. (Knapp-USGS)

COASTAL EROSION IN THE NILE DELTA,
United Nations Educational, Scientific and Cultural Organization, New York.
Ev Nielsen.
Nature and Resources, Vol 9, No 1, p 14-18, January-March 1973. 1 fig, 1 ref.

Descriptors: *Soil erosion, *Coasts, *Deltas, *Sediment control, *Africa, Flood plains, Erosion control, River basins, Planning, Programs, Dams, Reservoirs, Environmental effects, Streamflow, Sediment transport, Project purposes, Data collections.
Identifiers: *Nile delta (Africa), Egypt.

Following the planning and the construction of the Aswan High Dam, closed off in 1964, Egyptian scientists have had to consider the question of the nature and scope of the changes to the Nile valley and to the Nile delta and its shores, that would result from impounding the seasonal Nile flood waters with their sediment load in the dam reservoir (Lake Nasser). The objective of the present phase of the project, approved by the United Nations Development Program, is to assist the government in carrying out a comprehensive scientific study of the causes of coastal erosion in the Nile delta area, and in the preparation of a plan for coastal protection works, including recommendations for design and construction. Operations to be carried out by the project will provide for: (a) a detailed description of the Nile delta shore in terms of geography, geology, morphology as well as hydraulic, littoral drift and erosion conditions; and (b) on the basis of evaluation of the data, recommendations for the design and construction of the required coastal protection works. (Woodard-USGS)

ANNOTATED BIBLIOGRAPHY AND COMMENTS ON SEDIMENTATION IN THE CONNECTICUT RIVER,
Vermont Univ., Burlington.
D. P. Fay, and R. N. Downer.
In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area, Massachusetts Water Resources Research Center, Publication No. 25, 1973, Appendix B, 1 fig, 19 p, 41 ref. OWRR C-2169 (No 3377) (1).

Descriptors: *Sedimentation, *Bibliographies, Deposition, Sediment load, Erosion, Urbanization, Environmental effects, *Connecticut River, *Diversion, *Inter-basin transfers.

It is evident from this literature survey that there is very little quantitative data on sedimentation in the Connecticut River basin. This is partly due to the fact that the Connecticut River bed is quite stable and has not experienced excessive sediment deposits. Also, although there has been rapid urbanization in localized areas within the basin, the general trend in the basin is toward reforestation and thus reduction in sediment production. The report recommends, however, that (1) certain special areas such as river bends and urbanizing tributaries should be studied; (2) that at least one sediment load station should be established on the main stem of the river; and (3) that where historic data is available on cross-sections and reservoirs these areas should be surveyed again and periodically in the future. Sediment transport data from four tributary streams are plotted on a graph. (See also W73-10726). (Elfers-North Carolina).

SHAPE AND NATURE OF SMALL SEDIMENTARY QUARTZ PARTICLES,
Queens Coll., Flushing, N.Y. Dept. of Earth and Environmental Sciences.
D. H. Krinsley, and I. J. Smalley.
Science, Vol 180, No 4092, p 1277-1279, June 22, 1973. 4 fig, 7 ref.

Descriptors: *Quartz, *Sediments, *Particle shape, *Particle size, *Petrofabrics, Sedimentology, Sedimentation, Sedimentary structures, Loess, Clays, Silts.

Small quartz particles in sediments are almost always shaped like flat plates. Also, they are almost invariably produced by breakage, attrition from larger particles. This suggests that a cleavage mechanism operates in quartz when the particle size is reduced below a critical value. This critical size may be on the order of 100 micrometers. This cleavage may occur on the (0001) planes (c planes). (Knapp-USGS)

SHELF SEDIMENT TRANSPORT: PROCESS AND PATTERN.
Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, D. J. P. Swift, et al, editors, 1972. 656 p.

Descriptors: *Sediment transport, *Ocean currents, *Continental shelf, *Currents (Water), *Waves (Water), Surf, Turbulence, Sedimentation, Sedimentology, Distribution patterns.

This volume contains papers presented in a symposium on shelf sediment transport conducted at the annual meeting of the Geological Society of America held in Washington, D.C., November 1971. Several papers not delivered at the symposium were added to broaden the scope. The three sections of the book are concerned with shelf hydraulic regime and mechanics of sediment transport, suspended sediment dispersal, and bottom sediment dispersal. The goal of assembling these papers was to document some fundamental aspects of the shelf milieux and its sediment dispersal systems, to indicate the nature and scope of present knowledge and the direction of ongoing research, and to provide some perspective on the problems associated with understanding, determining, and predicting sediment transport on continental shelves. AN INTRODUCTION TO OCEANIC WATER MOTIONS AND THEIR RELATION TO SEDIMENT TRANSPORT,
Army Coastal Engineering Research Center, Washington, D.C.
J. R. Weggel.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 1-20, 1972. 5 fig, 12 ref.

Descriptors: *Sediment transport, *Ocean currents, *Continental shelf, *Currents (Water),

*Waves (Water), Surf, Turbulence, Sedimentation, Sedimentology, Distribution patterns.

A brief discussion of those aspects of flow important in sedimentation studies is presented as an introduction to discussion of the physical principles governing fluid flows. Examples of how these principles manifest themselves in the oceans, the assumptions made in simplifying the governing equations, and in some cases how the flow is related to sediment movement, are presented. Wave motions, particularly wave-induced near-bottom velocities, are discussed with regard to their increasing ability to agitate bottom materials as waves move shoreward across the continental shelf. Ocean currents also provide a mechanism for transporting marine sediments. Examples of observed current phenomena and the assumptions made to simplify the governing equations are presented. The deflection of wind driven turbulent currents caused by Coriolis effects results in the well-known Ekman spiral. Ekman's result for deep water is given. The important implication for shelf sediment transport studies is that care must be exercised in extrapolating surface wind and current observations to the near-bottom currents that are important in moving sediments. WAVE BOUNDARY LAYERS AND THEIR RELATION TO SEDIMENT TRANSPORT,
Army Coastal Engineering Research Center, Washington, D.C.
P. G. Teleki.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 21-59, 1972. 15 fig, 81 ref.

Descriptors: *Sediment transport, *Continental shelf, *Surf, Waves (Water), Ocean waves, Ocean currents, Littoral drift, Erosion, Boundary layers, Turbulent flow, Turbulence, Unsteady flow, Sedimentation.
Identifiers: *Oscillating flow.

Sediment transport in the ocean is examined from the viewpoint of oscillating flows. Principles of both steady and unsteady boundary layers are reviewed. In the potential flow region the forcing function is represented by the combined effect of waves and currents. This paper is concerned mainly with the effects of waves. A unifying theory for energy dissipation and sediment transport under shoaling, breaking, and transformed waves does not exist because the nonlinearity present in wave motion and in turbulence has not been appraised. Study of the response function (sediment motion) can be conducted more efficiently through research on boundary layers in oscillating flows. Relationships for the distribution of velocity and shear stress in periodic flows are dependent on the characteristic frequency and amplitude of oscillation. Shear stress measurements show increasing magnitude shoreward, outside the zone of breaking waves. There is no adequate theory for the mechanics of energy dissipation and sediment motion in the region of shoaling, breaking, and broken waves. Consequently, the assumption of wave energy conservation up to wave breaking is open to reappraisal because it ignores the physical evidence presented by tracer experiments of sediment moving offshore of the breaker zone. (See also W73-10746) (Knapp-USGS)
W73-10748

PREDICTING INITIAL MOTION AND BEDLOAD TRANSPORT OF SEDIMENT PARTICLES IN THE SHALLOW MARINE ENVIRONMENT,
Washington Univ., Seattle. Dept. of Oceanography.
R. W. Sternberg.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 61-82, 1972. 26 fig, 1 tab, 25 ref. AEC AT-45-1-2225 TA 21-1, NSF GA 28964.

Descriptors: *Sediment transport, *Continental shelf, *Surf, Waves (Water), Ocean waves, Ocean currents, Littoral drift, Erosion, Boundary layers, Turbulent flow, Turbulence, Unsteady flow, Sedimentation.

Boundary-layer and sediment-transport measurements from the marine environment were used to develop a procedure for predicting grain movement for sand-sized particles over the sea floor. Given a knowledge of sediment texture and mean velocity one meter from the seabed it is possible to estimate the boundary-shear stress, predict the initiation of grain movement, and estimate the mass transport of sediment as bedload. The Bagnold bedload equations are used for the bedload transport predictions, modified to fit the results of oceanographic field experiments. The advantages of this procedure are its simplicity with respect to the independent variables (mean velocity and sediment size) and that every step in the technique was developed from field measurements; hence, it is specially suited for application in the marine environment. EXPERIMENTS ON BOTTOM SEDIMENT MOVEMENT BY BREAKING INTERNAL WAVES,
Massachusetts Inst. of Tech., Cambridge. Dept. of Earth and Planetary Sciences.
J. B. Southard, and D. A. Cacchione.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 83-97, 1972. 11 fig, 14 ref. ONR Contract N00014-67-A0204-0048.

Descriptors: *Internal waves, *Sediment transport, *Gravity waves, *Continental shelf, Thermocline, Interfaces, Waves (Water), Ocean waves, Thermal stratification, Hydraulic models, Model studies, *Bottom sediments.
Identifiers: Breaking internal waves.

Bottom-sediment movement produced by oceanic internal gravity waves as they shoal on the continental shelf or upper slope were studied over a planar sloping bottom mantled with lightweight acrylic sediment using a two-layer fluid medium in a large wave tank. The waves break abruptly as they shoal, producing a breaker in the form of a turbulent and rapidly dissipating vortex. There is a compensating return flow of mixed fluid along the bed between breakers. Sediment is moved upslope by the breakers, partly in suspension, and downslope by the return flow, as bedload. Predominant flow at the bed and therefore also net sediment transport are downslope. Sediment movement is strongest just upslope of the point of breaking and decreases to zero gradually upslope and sharply down slope. Sediment ripples form and migrate downslope toward the point of breaking despite disruption by each breaker. There is a broad band of slow net erosion upslope and a narrower band of more rapid net deposition near the point of breaking. (See also W73-10746) (Knapp-USGS)

WAVE ESTIMATES FOR COASTAL REGIONS,
Army Coastal Engineering Research Center, Washington, D.C.
D. L. Harris.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 99-125, 1972. 16 fig, 4 tab, 34 ref.

Descriptors: *Waves (Water), *Data collections, *Surf, *Coasts, *Continental shelf, Aerial photography, Instrumentation, Time series analysis, Frequency, Frequency analysis, Wavelengths, Weather.

Significant information about wave climate can be obtained from aerial photographs and instrument records, visual observations, and wave hindcasts based on weather charts. Estimates of wave-height data from all of these are reasonably well correlated. Observations of wave period are considerably less satisfactory. Aerial photographs and spectral analysis of instrument records indicate that two or more wave trains with distinct periods are generally present; however, visual observations and most manual analyses of instrument records give only one wave period for each observation. This is largely the result of a tendency by observers to assign a single value to the wave period even though several distinct periods are important. In addition, reported values of wave period from shipboard generally give little indication of the period experienced near the beach. This results both from masking of long period waves by short period seas, and from peaking up of long period waves in the breaker zone. (See also W73-10746) (Knapp-USGS)
W73-10751

OBSERVATIONS ON WIND, TIDAL, AND DENSITY-DRIVEN CURRENTS IN THE VICINITY OF THE MISSISSIPPI RIVER DELTA,
Louisiana State Univ., Baton Rouge. Coastal Studies Inst.
S. P. Murray.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 127-142, 1972. 8 fig, 1 tab, 13 ref. ONR-GP Contract N00014-69-A-0211-0003.

Descriptors: *Currents (Water), *Continental shelf, *Deltas, *Mississippi River, Winds, Water circulation, Density currents, Tides.
Identifiers: *Mississippi Delta.

Variation with depth of currents and water density were studied in 15 m of water east of the Mississippi River delta for 5 days in March 1970. After a tidal current was isolated and removed, the residual current data were closely correlated with winds and density gradients. Wind effects are of great importance to current structure on the shelf east of the Mississippi River delta. When wind speeds exceed about 20 knots from the southeasterly quadrant, currents driven directly by the wind, in combination with slope currents generated by wind setup against the coast, produce vertical circulation patterns with onshore flow in the surface waters and offshore flow in the bottom waters. Density structure and the redistribution of mass by winds can alter and even reverse the velocity field produced by the wind effects. After a southeasterly storm, strong south to southwesterly currents persist for several days, producing a relatively stable current. (See also W73-10746) (Knapp-USGS)
W73-10752

SEDIMENT TRANSPORT ON THE CONTINENTAL SHELF OFF OF WASHINGTON AND OREGON IN LIGHT OF RECENT CURRENT MEASUREMENTS,
Washington Univ., Seattle. Dept. of Oceanography.
J. D. Smith, and T. S. Hopkins.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 143-180, 1972. 16 fig, 2 tab, 34 ref. AEC Contract AT (45-1)-2225-T25.

Descriptors: *Sediment transport, *Continental shelf, *Washington, *Currents (Water), Suspended load, Bed load, Storms, Current meters, Data collections, Sampling, Bottom sediments, Particle size, Oceanography.

Current measurements were made on the central and outer parts of continental shelves off Washington and Oregon. Emphasis was placed upon obtaining a time series of at least a two-year duration at a single location. Significant sediment

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

transport occurs only during storms, and the near-bottom currents have a substantial offshore component. Suspended load transport of sediment is extremely important, whereas bedload transport of sediment is not. Although no completely satisfactory theory for suspended-sediment transport is available, estimates indicate that a typical winter storm with current speeds up to 60 cm per sec transports on the order of 6 cu m per hr per m of shelf length; a storm with speeds of up to 70 cm per sec transports about 15 cu m per hr per m off of the continental shelf and into deeper water. Such calculations suggest that a severe storm occurring every few years might have more geological significance than a number of less severe storms. (See also W73-10746) (Knapp-USGS)
W73-10753

IMPLICATIONS OF SEDIMENT DISPERSAL FROM LONG-TERM, BOTTOM-CURRENT MEASUREMENTS ON THE CONTINENTAL SHELF OF WASHINGTON,
Washington Univ., Seattle. Dept. of Oceanography.
R. W. Sternberg, and D. A. McManus.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 181-194, 1972. 7 fig, 3 tab, 10 ref. AEC Contracts AT (45-1)-1725 and AT (45-1)-2200.

Descriptors: *Sediment transport, *Continental shelf, *Washington, *Currents (Water), Suspended load, Bed load, Storms, Current meters, Data collections, Sampling, Bottom sediments, Particle size, Oceanography.

Current speed and direction data collected near the seabed of the Washington continental shelf were analyzed for magnitude and directional response. Histograms show the directional variability of the various speed classes. Data within speed classes were averaged over monthly and annual periods to determine the net direction of movement of bottom water. On the continental shelf of Washington, the bottom currents respond strongly to the surface wind stress. Currents of all speeds show a high degree of directional variability; however, all bottom currents greater than 10 cm per sec exhibit an overall trend to the northwest. Sediment movement frequently occurs on the central continental shelf during the winter months. Lateral sediment dispersal (across the shelf) should occur as a result of the high variability of current direction with a net northward displacement of sediment. The maximum annual displacement that could be experienced by a sedimentary particle under the observed conditions is estimated to be approximately 220 km to the northwest. W73-10754

SHELF SEDIMENT TRANSPORT: A PROBABILITY MODEL,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
D. J. P. Swift, J. C. Ludwick, and W. R. Boehmer.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 195-223, 1972. 8 fig, 5 tab, 33 ref.

Descriptors: *Sediment transport, *Continental shelf, *Markov processes, *Probability, *Statistical models, Sediment sorting, Sedimentation, Particle size, Distribution patterns.

For many purposes the most useful conceptual framework for the study of detrital sediments is that of the sediment transport system. A system is comprised of a sediment source and a dispersal zone which is at once a conduit and sink. Sediment transport systems impress granulometric and other petrographic gradients on their deposits by means of progressive sorting and similar mechanisms. Markov process modeling may be used for testing assumptions concerning sediment-transport systems. Transition probabilities are employed as operational substitutes for incompletely understood physical mechanisms. In particular, the granulometric evolution of a detrital sediment stream through a dispersal zone may be examined stage by stage. A simple, one-dimensional model consists of a Markov chain of nine transient states with nonzero transition probabilities between adjacent states only. Calculation of the limiting state probability distribution permits the further calculation of simulated sediment size frequency distributions across a hypothetical shelf. Progressive size sorting will occur in the model if the transport is over a depositional surface. If the input size distribution is not approximately normal, the distribution will evolve towards the normal configuration during the sorting process. In several variants of the model, standard deviation tends to decrease and kurtosis to increase. Skewness may increase, especially if the transport competence declines across the system. TRANSPORT AND ESCAPE OF FINE-GRAINED SEDIMENT FROM SHELF AREAS,
University of East Anglia, Norwich (England). School of Environmental Sciences.
I. N. McCave.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 225-248, 1972. 6 fig, 1 tab, 97 ref.

Descriptors: *Sediment transport, *Continental shelf, *Mud, Currents (Water), Density currents, Turbidity currents, Bottom sediments, Bed load, Suspended load, Diffusion, Dispersion, Erosion, Ocean currents, Littoral drift.

Waves and tidal currents contribute to a process of diffusive transport of sediment across the continental shelf. Critical erosion friction velocities for cohesive sediment are related to yield strength. Deposition is controlled by the nearbed concentration, settling velocity, and a limiting shear stress above which no sediment is deposited. Critical erosion shear stresses greater than limiting stress are required after only a few hours compaction of a freshly deposited bed. Thus deposits formed nearshore from high-concentration flows during calm weather may develop sufficient cohesive strength to withstand storm conditions. Mid-shelf mud belts arise from diffusive transport across the shelf to deposition sites where wave and tidal activity are relatively lower than on the inner or outer shelf. Outer-shelf and blanket mud deposits are caused by higher than average concentrations occurring under advective mud streams. Most suspended sediment escaping from shelves must be deposited on the slope and rise. Of this the greater part must be in cones and fans off the major input points. As the concentrations are very low, settling does not give the required rates of deposition, thus high-level escape of sediment is precluded, and escape from shelves must be mainly along the bottom. Possible transport mechanisms are cascading of cold water off the shelf in winter, water movement down submarine canyons, bottom Ekman layer transport downslope under major ocean boundary currents, and low-concentration turbidity currents. W73-10756

SOURCES AND SINKS OF SUSPENDED MATTER ON CONTINENTAL SHELVES,
Geological Survey, Woods Hole, Mass.
R. H. Meade.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 249-262, 1972. 51 ref.

Descriptors: *Continental shelf, *Suspended load, *Provenance, *Sedimentation, Aquatic life, Bottom sediment, Dispersion, Sediment transport.
Identifiers: *Sediment sources.

While river sediments are the principal sources of suspended matter on many continental shelves, their importance on the Atlantic Continental shelf of the United States is less than that of biogenic detritus produced by shelf organisms and of material resuspended from the shelf bottom. The major sites of accumulation of suspended matter from the Atlantic shelf are in the large estuaries and coastal marshlands rather than on the shelf itself or in the deep sea. Sources other than river sediments and sinks other than the sea floor should be given ample consideration in assessing the dispersal of suspended sediments on other continental margins of the world. W73-10757

SUSPENDED SEDIMENTS IN CONTINENTAL SHELF WATERS OFF CAPE HATTERAS, NORTH CAROLINA,
Illinois Univ., Chicago. Dept. of Geology.
B. A. Buss, and K. S. Rodolfo.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 263-279, 1972. 8 fig, 22 ref. NSF Grants GA-1072 and GA-12783.

Descriptors: *Suspended load, *Continental shelf, *Salinity, *Currents (Water), *Ocean currents, Waves (Water), Mixing, Bottom sediments, Water temperature, Remote sensing, Littoral drift.
Identifiers: *Cape Hatteras.

Suspended sediment and salinity samples were taken at 46 stations over the Cape Hatteras shelf area August 26-28, 1970 to provide field data on the Cape Hatteras plume seen in Apollo 9 photographs. Relatively high levels of suspensate (more than 2 mg per liter) and waters of low salinity from Pamlico Sound issue onto the shelf through Okracoke and Hatteras Inlets. A portion of this outflow is moved southward by coastal currents. In the shoal waters off the cape, mixing by waves and currents causes suspensions of between 0.5 and 1.0 mg per liter. Seaward, suspensions are gradually diluted to less than 0.10 mg per liter on the outer shelf and slope. (See also W73-10746) (Knapp-USGS)
W73-10758

MINERALOGY OF SUSPENDED SEDIMENT OFF THE SOUTHEASTERN UNITED STATES,
Smithsonian Institution, Washington, D.C. Div. of Sedimentology.
J. W. Pierce, D. D. Nelson, and D. J. Colquhoun.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 281-305, 1972. 8 fig, 5 tab, 39 ref. NSF Grants GB17545 and GA27725.

Descriptors: *Suspended load, *Continental shelf, *Mineralogy, *Provenance, Sampling, Currents (Water), Rivers, Distribution patterns, Ocean currents, Atlantic Ocean, Southeast U.S.

On the continental shelf from Chesapeake Bay to Savannah, Georgia, four water masses were found with distinct mineral suites suspended in the water. The mineralogy associated with each watermass reflects the contribution of continental sediment from the area where the watermasses originate. Minerals suspended in Carolinian coastal water apparently are the result of river runoff in the Carolinas and Georgia. The suite in the Virginian coastal water has northern affinities and probably originates north of Chesapeake Bay. Gulf stream and Carolinian slope water also have diagnostic suites. Mineralogy can be used to identify watermasses in the way that temperature and salinity have been used. (See also W73-10746) (Knapp-USGS)
W73-10759

SEDIMENT TRANSPORT ON THE SANTA BARBARA-OXNARD SHELF, SANTA BARBARA CHANNEL, CALIFORNIA,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
D. E. Drake, R. L. Kolpack, and P. J. Fischer.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 307-331, 1972. 18 fig, 2 tab, 20 ref.

Descriptors: *Sediment transport, *Continental shelf, *Floods, *California, Turbidity currents, Thermal stratification, Density currents, Littoral drift, Ocean currents, Waves (Water), Currents (Water).

The floods of January and February 1969 in California caused a record discharge of sediment into the waters over the Santa Barbara-Oxnard Shelf. Following the floods, suspended sediment concentrations were highest over the inner shelf and exhibited an approximately exponential decrease across the shelf at all water depths. Concentrations were generally highest near the bottom and ranged from approximately 50 mg per liter over the inner shelf during the floods to less than 1.0 mg per liter at the shelf break late in 1969 and early in 1970. Redistribution of the flood sediment involved rapid erosion over the inner shelf and transfer of this material to the middle and outer shelf occurred within protected topographic depressions and in response to the seaward decline in current energies. Seaward transport of material occurred within a northwestward and westward flowing geostrophic current and within a current convergence trending across the shelf from Ventura. Transport of suspended particles across the shelf in the presence of thermal stratification within the water column resulted in detachment of turbid water from the near-bottom nepheloid layer. W73-10760

COMMENTS ON THE DISPERSAL OF SUSPENDED SEDIMENT ACROSS THE CONTINENTAL SHELVES,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
J. R. Schubel, and A. Okubo.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 333-346, 1972. 7 fig, 14 ref. NSF Grants GA 28276 and GA 16603.

Descriptors: *Sediment transport, *Continental shelf, *Suspended load, *Dispersion, *Distribution patterns, Sedimentation, Deposition (Sediments), Surf, Silts, Estuaries, Rivers, Mathematical models, Littoral drift, Ocean currents, Currents (Water).

Most fine-grained inorganic deep-sea sediment is derived from the continents and crossed the continental shelves to reach the ocean basins. Most of it crossed the shelves in suspension, but the routes and rates of transport are obscure. Most of the sediment now being discharged by rivers is trapped in estuaries, but nearly all that escapes crosses the shelf. A simple steady-state, two-dimensional mathematical model applied off the mouth of Chesapeake Bay supports the idea of bypassing of the shelf by fine-grained terrigenous sediment, and suggests that much of the fine-grained sediment that escapes the estuaries may be accumulating on the continental slope and rise. The cross-shelf flux of sediment associated with the mean (residual) flow can account for most of the sediment that reaches the ocean basins. (See also W73-10746) (Knapp-USGS)
W73-10761

SOME SPECIFIC PROBLEMS IN UNDERSTANDING BOTTOM SEDIMENT DISTRIBUTION AND DISPERSAL ON THE CONTINENTAL SHELF,
Washington Univ., Seattle. Dept. of Oceanography.
J. S. Creager, and R. W. Sternberg.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 347-362, 1972. 3 fig, 1 tab, 34 ref.

Descriptors: *Sediment transport, *Continental shelf, *Suspended load, *Dispersion, *Distribution patterns, Sedimentation, Deposition (Sediments), Surf, Silts, Estuaries, Rivers, Mathematical models, Littoral drift, Ocean currents, Currents (Water), *Bottom sediments.

Research into the problems of continental-shelf-sediment classification, distribution, and dispersal mechanisms should not be a simplistic study of sediment distribution alone. The dispersal mechanisms which have sometimes been intuitively deduced must be observed and measured. Study of the processes rather than the results must be an immediate goal. An example is presented to point out how intuition has led to a general misunderstanding of the sediment types present on Arctic continental shelves. This has led to a second-order misinterpretation of dispersal mechanisms deduced from the generality that Arctic continental shelves are covered by glacial sediment. A second example is given of the problems encountered in attempting to apply a wave-surge dominated, shelf sediment dispersal model to the Washington continental shelf. W73-10762

IMPLICATIONS OF SEDIMENT DISPERSAL FROM BOTTOM CURRENT MEASUREMENTS; SOME SPECIFIC PROBLEMS IN UNDERSTANDING BOTTOM SEDIMENT DISTRIBUTION AND DISPERSAL ON THE CONTINENTAL SHELF--A DISCUSSION OF TWO PAPERS,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
D. J. P. Swift.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 363-371, 1972. 1 fig, 23 ref.

Descriptors: *Sediment transport, *Continental shelf, *Suspended load, *Dispersion, *Distribution patterns, Sedimentation, Deposition (Sediments), Surf, Silts, Estuaries, Rivers, Mathematical models, Littoral drift, Ocean currents, Currents (Water).

The wind-drift component of shelf storm currents is a major, if not dominant, cause of unidirectional currents over large portions of most nontidal shelves. The current velocity field over the shelf is complex. In storm-generated bottom currents a unidirectional component of compound origin is dominant, and the surge-dominated flow is characterized but not confined to the fair-weather hydraulic regime. Shelf currents are frequently of compound origin. Such an approach to study of sediments may encourage examination of the role of waves as a contributing factor in shelf sediment transport. A simple random walk model for sediment transport across the shelf does not accurately describe the advective component of sediment transport. It does, however, accommodate the diffusive component. The more flexible Markov-process model is valid for both components. (See also W73-10746) (Knapp-USGS)
W73-10763

SEDIMENT TRANSPORT AROUND THE BRITISH ISLES,
National Inst. of Oceanography, Wormley (England).
A. H. Stride.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 373-375, 1972. 10 ref.

Descriptors: *Sediment transport, *Continental shelf, *Sedimentation, *Distribution patterns, *Sedimentary structures, Tides, Waves (Water), Currents (Water), Water circulation, Ocean currents.
Identifiers: *British Isles.

The sea floor around the British Isles is a good region for studying sedimentation processes. The strong currents occurring in some regions produce a suite of characteristic bed forms. There are extensive areas of floor at most depths down to about 200 m, with enclosed seas, narrow straits, and long open reaches of ocean-facing continental shelf. Some floors were heavily glaciated while others lay beyond the ice sheets. The main currents are tidal, with strength near the sea surface reaching between one half and 4 knots over large areas; other currents are intermittent, more variable in direction and generally weak. The known bed forms include longitudinal furrows and gravel waves, sand ribbons, and sand waves. The direction of net transport of sand and gravel seems to be determined by the peak tidal current asymmetry, while storm waves can increase the transport more than twentyfold in winter. There are extensive sheetlike deposits of gravel, sand, and silt where grade is in equilibrium with current strength. Sand deposits being laid on a gravel floor can be represented by isolated patches when sand is in short supply. Elsewhere, there are isolated deposits of sand tied to estuaries, bays, headlands, straits, and to the edge of the continental shelf. (See also W73-10746) (Knapp-USGS)
W73-10764

MIGRATION OF TIDAL SAND WAVES IN CHESAPEAKE BAY ENTRANCE,
Old Dominion Univ., Norfolk, Va. Inst. of Oceanography.
J. C. Ludwick.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 377-410, 1972. 10 fig, 2 tab, 62 ref.

Descriptors: *Sand waves, *Chesapeake Bay, *Continental shelf, *Shoals, *Sediment transport, Sedimentary structures, Sedimentation, Tides, Water circulation, Estuaries, Currents (Water), Sand bars.

Subtidal sand waves occur atop shoals and on shoal margins in the northern part of the tidal entrance to Chesapeake Bay, Virginia. Wavelength ranges from 60 to 245 m; height ranges from 1.5 to 3.4 m. All major slopes are 2 to 3 deg, far less than the angle of repose. In flood-dominated tidal channels, sand waves are asymmetrical and face landwards; in ebb-dominated tidal channels and atop most banks, sand waves face seawards. Where near-bottom flood and ebb tidal currents are equal in time-velocity impulse, sand waves of symmetrical-trochoidal profile are developed. The seaward-facing asymmetrical sand waves are migrating seaward at 35 to 150 m per yr. Sand wave height changes seasonally; small heights occur from October to late April when surface water waves are frequently higher than 1.5 m; large sand wave heights occur from May to September, particularly during the latter month when surface water waves are usually lower than 1.5 m in height. Prominant shoals in the entrance area characteristically have ebb-dominated near-bottom tidal currents on one side and flood-dominated near-bottom tidal currents on the other side. This pattern is suggestive of a sand circulation conjoint with the shoal. (See also W73-10746) (Knapp-USGS)
W73-10765

WATER CIRCULATION AND SEDIMENTATION AT ESTUARY ENTRANCES ON THE GEORGIA COAST,
Skidaway Inst. of Oceanography, Savannah, Ga.
G. F. Oertel, II, and J. D. Howard.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 411-427, 1972. 12 fig, 31 ref. USCE Contract DACW 72-68-C-0030, NSF Grant GA-30565.

Descriptors: *Sedimentation, *Coastal plains, *Shoals, *Georgia, *Estuaries, Water circulation, Currents (Water), Tides, Waves, Littoral drift, Aggradation, Sediment transport, Distribution patterns.

Estuary entrance-shoals extend seaward of all major entrances of the Georgia coast. Orientations and morphologies of these shoals are in response to (a) transient coastal currents controlled by seasonal winds, (b) relationships of ebb jets to coastal currents, and (c) hydraulic pressure gradients at entrances. Northeasterly winds create high-energy swells which result in southward diversion of longshore drift and aggradation of shoals on the north sides of inlets. These shoals are detached from the shoreline and are generally breached in several places by small tidal channels. Attached shoals on the south sides of inlets are starved during these periods. Southerly onshore winds result in currents which cause seaward prograding of shoals on the south sides of inlets. At the same time, sediment cells and gyres trap sediment on shoals on the north sides of inlets and accretion is multidirectional. (See also W73-10746) (Knapp-USGS)
W73-10766

ONSHORE TRANSPORTATION OF CONTINENTAL SHELF SEDIMENT: ATLANTIC SOUTHEASTERN UNITED STATES,
Duke Univ., Durham, N.C. Dept. of Geology; and Duke Univ., Beaufort, N.C. Marine Lab.
O. H. Pilkey, and M. E. Field.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 429-446, 1972. 6 fig, 1 tab, 35 ref.

Descriptors: *Sediment transport, *Provenance, *Continental shelf, *Beaches, Coasts, Mineralogy, Sands, Surf, Water level fluctuations, Distribution patterns.

Beach and estuarine sands on the southeastern United States Atlantic coast are derived in part from the adjacent continental shelf. Anomalies in abundances of phosphorite grains, in total gold content, in ooids, and in various heavy minerals (in particular, epidote, staurolite, and garnet) on the shelf show a close correspondence to anomalies in adjacent shoreline and near-shore environments. Carbonate content and textures of beach and shelf deposits show a correlation between the two environments on a regional scale. Oolitic grains in central Florida beach sands and phosphorite grains on North Carolina beaches originate exclusively from continental shelf sources lying appreciable distances (up to 20 km) offshore, thus demonstrating onshore transportation in these cases. The presence of easily abraded, shelf-derived oolite grains in quartz beach sands is evidence of onshore transportation occurring at present. Some of the inferred movement of sediment may have occurred actually by the simple process of landward migration of the surf wedge or shoreface during the last rise in sea level rather than by present-day processes. Possible mechanisms of present-day movement include asymmetry of shoaling waves and tidal and storm-induced currents. (See also W73-10746) (Knapp-USGS)

In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 447-498, 1972. 22 fig, 1 tab, 69 ref.

Descriptors: *Sedimentation, *Coastal plains, *Shoals, Sand bars, Aggradation, Sediment transport, Sands, Coasts, Sand spits, Estuaries, Distribution patterns.

The inner Atlantic continental shelf from Long Island to Florida is characterized by fields of linear, northeast trending shoals. The shoals have up to 30 ft of relief, have side slopes of a few degrees and extend for tens of miles. Clusters of linear shoals merge with the shoreface in water as shallow as 10 ft. These inner-shelf sand bodies or shoals can be grouped as arcuate (inlet and cape-associated) and linear. Linear shoals may radiate from estuary mouths, as a second order structure on arcuate, inlet-associated shoals, or may occur on the open coast. Linear shoals on the open coast may be shoreface-connected or isolated. All linear shoals of the open coast form a small angle with the coast line; most open northward regardless of presumed direction of net littoral drift. The cape-associated shoals are plano-convex features resting upon a featureless, nearly horizontal stratum. Formation of shoals post-dated the last transgression; hence they are all younger than at least 11,000 BP. Changes in mineralogy of the shoals parallel changes in the mineralogy of adjacent beaches. Shoreface-connected shoals have granulometric characteristics similar to the beach. Shoreface-connected shoals appear to be forming in response to the interaction of south-trending, shore-parallel, wind setup currents with wave-generated bottom currents during winter storms. The helical flow that they induce in coast-parallel storm currents causes aggradation of their crests and fair-weather wave surge degrades them. Equilibrium shoal crest depth is about 30 ft on the inner shelf. A second mode of crest depth at 50 ft may reflect a recent stillstand at that level. (See also W73-10746) (Knapp-USGS)
W73-10768

HOLOCENE EVOLUTION OF THE SHELF SURFACE, CENTRAL AND SOUTHERN ATLANTIC SHELF OF NORTH AMERICA,
National Oceanic and Atmospheric Administration, Miami, Fla. Atlantic Oceanographic and Meteorological Labs.
D. J. P. Swift, J. W. Kofoed, F. P. Saulsbury, and P. Sears.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 499-574, 1972. 41 fig, 3 tab, 109 ref.

Descriptors: *Sedimentation, *Erosion, *Geomorphology, *Continental shelf, *Sediment transport, Beaches, Sedimentary structures, Shoals, Sand bars, Sand waves, Sand spits, Recent epoch, Pleistocene epoch, Distribution patterns.

The floor of the central and southern Atlantic shelf shows relict geomorphic features. An initial pattern is an erosional one consisting of major transverse shelf valleys and plateaulike interfluves. The dominant modern pattern is that of constructional topography formed at the foot of the shoreface. This constructional pattern is undergoing further modification in response to the modern hydraulic regime. A rise in sea level over an unconsolidated coast results in shore-face erosion, equivalent to parallel slope retreat, and a concomitant aggradation of the adjacent sea floor. The resulting discontinuous debris mantle, the Holocene transgressive sand sheet, is only partly autochthonous with respect to the Holocene sedimentary cycle, since it incorporates Holocene fluvial deposits. The surface of this sand sheet has been molded into a variety of morphologic elements. Where the sheet has been generated directly from the retreating shoreface, a ridge-and-swale topography has been empressed upon it. Off cuspate forelands, the convergence of littoral drift has resulted in cape-associated shoals. Off estuary mouths the intersection of littoral drift with the reversing estuary tide has created inlet-associated shoals. Shelf-transverse sand bodies, formed by the progressive landward displacement of shoreline deposition centers, are shoal-retreat massifs. The ridge-and-swale topography is a stable end-configuration toward which a variety of depositional and erosional topographies tend to converse. Southward sediment transport in the Middle Atlantic bight intensifies toward shore and toward the south, as far as Florida. (See also W73-10746) (Knapp-USGS)
W73-10769

SEDIMENT TEXTURAL PATTERNS ON SAN PEDRO SHELF, CALIFORNIA (1951-1971): REWORKING AND TRANSPORT BY WAVES AND CURRENTS,
University of Southern California, Los Angeles. Dept. of Geological Sciences.
D. S. Gorsline, and D. J. Grant.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 575-600, 1972. 15 fig, 2 tab, 40 ref.

Descriptors: *Sediment transport, *Particle size, *California, *Continential shelf, Sediment sorting, Littoral drift, Ocean currents, Currents (Water), Sedimentation, Tides, Waves (Water), Sedimentology, Distribution patterns.

Trend surfaces of sediment-size parameters of the San Pedro Shelf, California, calculated as moment measures show patterns that can be related to long wave and local current regimes. The shelf, off Los Angeles, is located in a region of intermediate wave energy, but is screened by offshore islands from most of the open ocean waves from the Pacific except for limited westerly and southerly approaches. Currents are tidal, wind-driven, and wave-generated long-shore drift from both south and west. An outer central zone of 20-40 m depth is probably affected by westerly and southerly long-period storm-wave convergence and prevailing wind-driven currents; a central area of outcropping Miocene rocks and relict sediments is being modified texturally by fine sediment drifted from the west; a southeastern coastal zone is dominated by north-flowing long-shore drift alongshore and by tidal exchange moving east from Los Angeles-Long Beach Harbor. Comparison of recent (1969-1970) data with earlier work (1951) shows some differences that suggest that the surficial sediments of the entire shelf surface are subject to change in a period of a couple of decades. Changes include both intrusion of fine sediments into a stable coarse sediment and active drift of fine sands in depths of 20-40 m. Some modification may extend to depths of as much as 100 m. (See also W73-10746) (Knapp-USGS)
W73-10770

OBSERVATIONS AND SIGNIFICANCE OF DEEP-WATER OSCILLATORY RIPPLE MARKS ON THE OREGON CONTINENTAL SHELF,
Oregon State Univ., Corvallis. School of Oceanography.
P. D. Komar, R. H. Neudeck, and L. D. Kulm.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 601-619, 1972. 8 fig, 3 tab, 23 ref. USGS Contracts 14-08-001-10766, -1194, and -12187.

Descriptors: *Sediment transport, *Continental shelf, *Oregon, *Ripple marks, *Waves (Water), Currents (Water), Storms, Sedimentary structures, Sand waves, Ocean currents, Littoral drift.

Symmetrical oscillatory ripple marks are found across the entire Oregon continental shelf out to water depths as great as 204 m. The ripples are principally of the trochoidal type, the crests trending north-south, parallel to the coast. Asymmetrical ripples are rare. Using Airy wave theory, bottom orbital velocities were calculated for average waves and storm waves. Velocities are sufficient to produce ripples out to depths of 100 m with occasional rippling to 200 m. Systematic variations in ripple length could be produced by a pattern of dispersed wave periods arriving from a distance-storm source. Besides producing ripples, the surface waves appear to be important in stirring and reworking the shelf sediments. Sediment transport on the shelf was examined with the Bagnold model in which the waves provide the power to place the bottom sediments in motion and a superimposed unidirectional current produces a net sediment drift. It is concluded that the effects of surface waves, as well as unidirectional currents, must be included in estimates of sediment transport on the continental shelf. (See also W73-10746) (Knapp-USGS)
W73-10771

CURRENTS AND SEDIMENT TRANSPORT AT THE WILMINGTON CANYON SHELFBREAK, AS OBSERVED BY UNDERWATER TELEVISION,
Smithsonian Institution, Washington, D.C. Div. of Sedimentology.
D. J. Stanley, P. Fenner, and G. Kelling.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 621-644, 1972. 6 fig, 1 tab, 37 ref.

Descriptors: *Sediment transport, *Continental shelf, *Remote sensing, *Instrumentation, *Photography, Currents (Water), Tides, Waves (Water), Suspended load, Bed load.
Identifiers: *Television (Underwater).

An underwater television survey was made of the outer shelf, shelfbreak, and upper slope in the vicinity of Wilmington Canyon, about 175 km southeast of Delaware Bay and the Middle Atlantic States. It provides direct evidence of active currents and sediment transport at 26 stations, in water depths ranging from about 65 to 430 m. The 22 hr of videotape recorded for this study covered an area of about 400 sq km. The system allows documentation of current activity and the movement of sand and silt from the outer shelf to deeper environments seaward of the shelfbreak. Although the survey was made during a very calm period with low sea states, bottom currents competent to move sediment on the sea floor were observed throughout most of the survey area. Large amounts of suspended fine-grained material were observed in the near-bottom water and probably were scoured from the sea floor by these bottom currents and subsequently transported by movement of water masses in the vicinity of the shelfbreak. The regional current net in Wilmington Canyon shows a varied directional pattern of flow, presumably influenced by tides. Recorded velocities of up to 20 cm per sec are of sufficient intensity to move fine sand and silt along the bottom and eventually off the shelf to the adjacent slope and canyon. (See also W73-10746) (Knapp-USGS)
W73-10772

NEARSHORE SEDIMENTARY PROCESSES AS GEOLOGIC STUDIES,
Skidaway Inst. of Oceanography, Savannah, Ga.
J. D. Howard.
In: Shelf Sediment Transport: Process and Pattern; Dowden, Hutchinson and Ross, Inc., Stroudsburg, Pennsylvania, p 645-648, 1972.

Descriptors: *Sedimentology, *Continental shelf, *Sediment transport, *Stratigraphy, *Distribution patterns, Currents (Water), Waves (Water).

Studies of nearshore sedimentary environments and their processes can be improved if those studying the modern and those investigating the ancient have a point of common interest. A definite possibility for this exists in the study of physical and biogenic sedimentary structures which represent the responses to processes. If an offshore-to-beach sequence the spectrum of energy changes in a predictable way even though the energy maxima vary. As the energy varies, so do the processes, and responses to processes, which determine the preservable facies characteristics. In such studies the Uniformitarian Principle is an obvious and necessary tool. Equally important is the opportunity to utilize the ancient as a key to understanding and predicting present-day processes. (See also W73-10746) (Knapp-USGS)

TRACE METALS IN CORES FROM THE GREAT MARSH, LEWES, DELAWARE.
Delaware Univ., Newark. Dept. of Geology.
R. N. Strom, and R. B. Biggs.
Available from NTIS Springfield, Va 22151 as COM-73-10206, Price $3.00 printed copy; $0.95 microfiche. College of Marine Studies Report DEL-SG-12-72, December 1972. 35 p, 12 fig, 7 ref, 2 append. NOAA Sea Grant 2-35223.

Descriptors: *Trace elements, *Sediments, *Coastal marshes, *Delaware, *Metals, Cores, Chemical analysis, Geochemistry, Salt marshes, Sedimentology, Correlation analysis, Depth, Zinc, Copper, Chromium, Iron, Lead, Cadmium.
Identifiers: *Great Marsh (Del).

Four 12-foot sediment cores and one 18-foot core were taken in the Great Marsh (Broadkill Marsh) near Lewes, Delaware, for the purpose of analyzing the areal and vertical changes in trace metal concentration in sediments deposited prior to the industrialization of the Delaware Bay watershed. The sediments are of marginal marine origin of brackish or saltwater conditions. The sediments of the Great Marsh were deposited during the Holocene marine transgression and deposition is apparently continuing unabated today. Lagoonal muds underlie the more recently formed salt-marsh materials. Beginning at 2 feet below land surface, samples were analyzed at 2-foot intervals for zinc, copper, chromium, iron, lead and cadmium. The levels of lead and cadmium were below the level of detectability (i.e. less than 1 ppm in the sediment sample). Zinc showed a slight increase in average concentration with increasing depth. Copper and cadmium showed no significant changes with depth. There appears to be no significant difference in the metal concentrations between the <63 micron and >63 micron fractions. (Woodard-USGS)

PRELIMINARY OBSERVATIONS ON DOWNSLOPE MOVEMENT OF SOIL DURING THE FALL IN THE CHINOOK BELT OF ALBERTA,
S. A. Harris.
In: Research Methods in Pleistocene Geomorphology; Proceedings of 2nd Symposium of Geomorphology, Summer 1971, Guelph, Ontario, Canada: Guelph University Publication, p 275-285, 1972. 5 fig, 8 ref.

Descriptors: *Mass wasting, *Alpine, *Canada, *Creep, Solifluction, Degradation (Slope), Snowmelt, Soil moisture, On-site data collections.
Identifiers: Kananaskis Valley (Alberta).

The main process operating on the slopes at Kananaskis, Alberta, during fall and winter is surface creep. This movement is the result of several processes producing similar effects under different conditions. The end product is a steady downslope movement of the upper sheet of soil and unconsolidated material. The movement is such that on a slope of 34 deg under a bearberry-rose association, the movement downslope amounts to over 130 mm between October and March. No runoff was observed. Accordingly, water erosion has been absent during the fall 1970 and winter 1970-71. Soil creep is the major element in movement of material. Solifluction and mudflows were not observed. Frost boils were observed on scree and on bearberry covered slopes of up to 20 deg. Snow creep occurred at the two sites where the snow was deepest. (Knapp-USGS)
W73-10977

DATING CAVE CALCITE DEPOSITS BY THE URANIUM DISEQUILIBRIUM METHOD: SOME PRELIMINARY RESULTS FROM CROWSNEST PASS, ALBERTA,
McMaster Univ., Hamilton (Ontario).
D. C. Ford, P. Thompson, and H. P. Schwarcz.
In: Research Methods in Pleistocene Geomorphology; Proceedings of 2nd Symposium on Geomorphology, Summer 1971, Guelph, Ontario, Canada: Guelph University Publication, p 247-255, 1972. 2 fig, 1 tab, 13 ref.

Descriptors: *Karst, *Radioactive dating, *Calcite, *Uranium radioisotopes, *Glaciation, Erosion, Scour, Pleistocene epoch, Topography, Geomorphology, *Canada.

Uranium trapped within a calcite deposit is a potential clock, recording the time elapsed since precipitation by measurable radioactive decay. Specimens of ancient or recent calcite were taken from eight caves in the Canadian Rockies and the modern uranium ion concentrations were measured in underground stream and percolation waters. The calcite specimens were deposited in phreatic cave sites which were air-filled when net deposition began. Dating and hydrogeological interpretation of the dates suggest that at least 2,600 feet (or 63%) of the present relief existed 275,000 years ago; 90% of the relief existed at 200,000 years B.P., before the onset of the penultimate glacial. Since that time the valleys have been lowered by no more than 400 feet. The mean rate of lowering for the past 200,000 years is 2 feet per thousand years or somehat less. (Knapp-USGS)
W73-10978

BIOTURBATION RATES AND EFFECTS IN CARBONATE SAND, ST. JOHN, U.S. VIRGIN ISLAND,
Geological Survey, Menlo Park, Calif.
H. E. Clifton, and R. E. Hunter.

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

Journal of Geology, Vol 81, No 3, p 253-268, May 1973. 9 fig, 1 tab, 43 ref.

Descriptors: *Bottom sediments, *Carbonates, *Benthos, *Aquatic animals, Sedimentary structures, Benthic fauna, Marine animals, Sands.
Identifiers: *Bioturbation, *Carbonate sands.

Bioturbational rates and effects were studied in carbonate sand at depths from about 10 to 20 m near a coral reef. Inactive sand ripples are totally destroyed in 2-4 weeks. Lamination in the upper 2 cm is largely obliterated in the same amount of time. Pebbles on the sea floor can be buried in a few days by faunal undermining. The rate and style of bioturbation are strongly controlled by grain size of the substrate. Surface modification and pebble burial are most rapid in relatively fine sand, whereas the rate of shallow internal disruption of the sediment may be more rapid in coarser sand. Bioturbation in this environment results largely from activity during daylight hours. A large amount of sediment can be moved vertically or laterally by such activity. (Knapp-USGS)

ACCELERATED MOTION OF A SPHEROID IN VISCOUS FLUID,
Wisconsin Univ., Milwaukee. Dept. of Energetics.
R. Y. S. Lai.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Paper 9809, p 939-957, June 1973. 8 fig, 12 ref, append.

Descriptors: *Settling velocity, *Particle shape, Mathematical studies, Sedimentation, Drag, Stokes law, Sedimentology.

The equation of motion of a spheroid accelerated along its axis of symmetry by an arbitrarily applied force in a viscous fluid is solved exactly. The solutions are presented in terms of tabulated functions. The unsteady drag predicted by the Stokes-flow solution was used in the analysis. Both prolate and oblate spheroids are considered. The results are reduced to those of the case of an accelerated sphere. A prolate spheroid with a ratio of major axis to minor axis equal to 1.96 has the greatest terminal settling velocity among spheroids of equal volume. The variations of velocity and displacement with time for some spheroids falling from rest are presented in graphs. (Knapp-USGS)

AT-STREAM-VELOCITY PUMPING SEDIMENT SAMPLING SYSTEM,
Geological Survey, Fort Collins, Colo.
J. P. Bennett.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Paper 9801, p 873-887, June 1973. 9 fig, 7 ref, append.

Descriptors: *Sampling, *Suspended load, *Sedimentology, Equipment, Instrumentation, Velocity, Open channel flow, Stream gages, Sediment transport, Streamflow, Water quality, Sediment load.

A sampling system collects water-sediment samples at local stream velocity from any point in an open-channel flow. The system uses a flow-through Pitot tube as a combination velocity sensor and sampler nozzle. A sample of any desired volume can be collected without changing the position of the sampler nozzle. To compare the performance of the system with that of other samplers, suspended-sediment samples were collected from a flat-bed flow using the system, a US DH-48 sampler modified for point sampling, and siphon sampler. On the basis of these samples, at the 99% confidence level, the relative percent difference between the concentrations of the samples from the system and the siphon sampler was between -5.45 and 4.45 and the relative percent difference between the concentrations of the samples from the system and from the US DH-48 was between -.54 and 7.78. SEDIMENTATION STUDIES OF BHAKRA RESERVOIR,
A. N. Malhotra, and R. N. Hoon.
Irrigation and Power (India), Vol 28, No 1, p 37-52, January 1971. 7 fig, 9 tab, 3 append.

Descriptors: *Sedimentation, *Reservoir silting, *Sedimentation rates, *Sediment control, Forest management, Land management, Land development, Construction, Check structures, Erosion control, Dams, Reservoir stages, Sediment transport.
Identifiers: *India (Bhakra Reservoir).

The Bhakra Dam in India was completed in October 1963 and has since changed the entire economy of the area it serves. The devastating floods have been controlled and benefits to irrigation and power have brought prosperity to the area. The direct and indirect benefits of the dam depend on the storage capacity of its reservoir. This has a designed live storage of 7434.23 million cubic meters and a dead storage of 2431.22 million cubic meters. Silt inflow into the reservoir affects the life of the dam. In an endeavor to correctly assess the life of the dam and to explore means to prolong it if possible, the catchment conditions have been studied and results of the capacity surveys, suspended silt measurements, analyzed. The present rate of sedimentation is somewhat higher than assumed. This is chiefly due to the catchment area being poorly vegetated and disturbance of the soil by large scale development in the catchment area. The sedimentation has shown signs of reduction in the past few years. Remedies such as afforestation and check dams have been suggested to decrease the sedimentation rate and increase the life of the reservoir. (Woodard-USGS)

RECONNAISSANCE OF CHEMICAL QUALITY OF SURFACE WATER AND FLUVIAL SEDIMENT IN THE PRICE RIVER BASIN, UTAH,
Geological Survey, Salt Lake City, Utah.
J. C. Mundorff.
Utah Department of Natural Resources, Salt Lake City, Technical Publication No 39, 1972. 55 p, 13 fig, 3 plate, 5 tab, 22 ref.

Descriptors: *Water quality, *Chemical analysis, *Sediment transport, *Utah, River basins, Hydrologic data, Basic data collections, Climatic data, Streamflow, Geology, Vegetation, Land use, Reservoirs, Water utilization, Water supply, Irrigation, Coal mines, Environmental effects, Maps.
Identifiers: *Price River basin (Utah).

The Price River basin is mainly in Carbon and Emery Counties in east-central Utah, and the total drainage area is about 1,900 square miles. Normal annual precipitation (1931-60) is more than 30 inches in headwaters areas and is less than 8 inches in the downstream part of the basin. Surface rocks in the basin range in age from Jurassic to Quaternary, but the rocks having predominant influence on water quality are marine shales of Creataceous age. The general chemical characteristics of the main stem of the Price River as determined by a reconnaissance during 1969-70 changed markedly between the headwaters and the mouth. The dissolved solids content ranged from less than 400 mg/liter in the headwaters to 2,740 mg/liter near the mouth. Suspended-sediment concentrations as high as 186,000 mg/liter were observed on a tributary, and as high as 111,000 mg/liter were observed on the Price River. A rough estimate of the suspended-sediment discharge of Price River at Woodside was at least 1,400,000 tons during the 1970 water year. (Woodard-USGS)

DETERMINATION OF NANOGRAM LEVELS OF SILVER IN SUSPENDED MATERIALS OF STREAMS RETAINED BY A MEMBRANE FILTER WITH THE 'SAMPLING-BOAT' TECHNIQUE,
Geological Survey, Denver, Colo.
T. T. Chao, and J. W. Ball.
Analytica Chimica Acta, Vol 54, p 166-168, 1971. 2 fig, 7 ref.

Descriptors: *Chemical analysis, *Metals, *Suspended solids, *Trace elements, Streams, Analytical techniques, Spectrophotometry, Sediments, Sampling, Testing procedures, Acids, Filters, Membranes, Spectroscopy.
Identifiers: *Silver determinations, Triisooctyl thiophosphate, Methyl isobutyl ketone, Nitric acid.

As one part of a study on the mechanisms of transport of silver in fluvial media, a number of water samples was collected from various streams in Colorado in the summer months of 1969 to be analyzed for silver. In general, 2.5 liters of water were taken from a stream and filtered through a 4-inch Gelman membrane filter at the sampling site. A plastic pressure filtration unit was used for the filtration of water under a nitrogen pressure of 40 psi. The filtered water was immediately acidified to pH 1 and saved for the determination of soluble silver in water. The analytical method consists of dry-ashing the membrane filter, digestion of the residue with nitric acid, quantitative extraction of silver into TOTP-MIBK (triisooctyl thiophosphate-methyl isobuytl ketone) stripping of silver back into 0.3 M hydrochloric acid, and measurement of the stripped silver with sampling-boat technique. Determinations are made with an atomic absorption spectrophotometer. (Woodard-USGS)
W73-10429

CHEMICAL INTERACTIONS OF ALUMINUM WITH AQUEOUS SILICA AT 25 DEGREES C,
Geological Survey, Washington, D.C.
J. D. Hem, C. E. Roberson, C. J. Lind, and W. L. Polzer.
For sale by GPO, Washington, D C 20402, Price $0.70. Geological Survey Water-Supply Paper 1827-E, 1973. 57 p, 23 fig, 7 tab, 40 ref.

Descriptors: *Water chemistry, *Crystallization, *Clay minerals, Aluminum, Silicates, Hydrogen ion concentration, Mineralogy, Solubility, Kinetics, Weathering, Alkalis (Bases).
Identifiers: *Halloysite.

Solutions containing from 0.00001 to 0.01 moles per liter of aluminum and dissolved silica in various ratios were aged at pH levels between 4 and 10

at 25 deg C. A collodial amorphous product having the composition of halloysite was produced in most solutions. It had a consistent and reversible equilibrium solubility equivalent to a standard free energy of formation of -897 kcal per mole. Most solutions gave consistent solubilities after only a few months of aging. Electron micrographs and diffraction patterns of the synthesized material indicate some crystallinity in the aluminosilicate, but no X-ray diffraction patterns could be obtained even in the material aged 4 years. Aluminum contents of 51 samples of water analyzed for other purposes are in reasonable agreement with the assumption of equilibrium with amorphous clay mineral species similar to the material synthesized in this work. Solubility calculations are summarized graphically for solutions of ionic strength of 0.01 and 0.10. (Knapp-USGS)

LARGER DIAMETER COLUMNS FOR MODERN, HIGH SPEED LIQUID CHROMATOGRAPHY,
Delaware Univ., Newark.
J. J. DeStefano.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106, Order No.,72-31,983. Ph D Dissertation, 1972. 142 p.

Descriptors: *Efficiencies, *Separation techniques, *Laboratory equipment, Research equipment, Particle size.
Identifiers: *Chromtographic columns, *Column preparation, *High speed liquid chromatography, Sample size, Chemical concentration, Liquid liquid chromatography, Liquid solid chromatography, Adsorbents, Porasil A.

Relatively large internal diameter columns are shown to exhibit superior efficiencies for both retained and unretained solutes when compared to narrow-bore, analytical liquid-liquid (LLC) and liquid-solid (LSC) chromatographic columns. This high level of column performance is ascribed to the 'infinite-diameter' column phenomenon proposed by Knox and Parcher. The controlled surface porosity support used in the LLC studies is shown to be capable of handling only modest amounts of solute without overloading. The totally porous silica adsorbent, Porasil A, used for LSC is found to be better suited for preparative applications because of its higher sample capacity. Sample sizes between 20 and 100 milligrams are demonstrated in two examples of preparative separations. The effects of sample volume and concentration, support particle size, and carrier velocity on column performance are also discussed. (Holoman-Battelle)

SIMULATION OF HYDROCHEMICAL PATTERNS IN REGIONAL GROUNDWATER FLOW,
Alberta Univ., Edmonton. Dept. of Geology.
F. W. Schwartz, and P. A. Domenico.
Water Resources Research, Vol 9, No 3, p 707-720, June 1973. 7 fig, 8 tab, 20 ref.

Descriptors: *Water chemistry, *Hydrogeology, *Simulation analysis, *Groundwater basins, Mass transfer, Equilibrium, Kinetics, *Canada, Mathematical models, Leaching, Weathering, Geochemistry.

UNIVERSITY OF ILL. URBANA CHAMPAIGN

The chemical state of a regional groundwater system in which several processes are acting is described by a simulation model that incorporates partial equilibrium, mass transfer, and reaction kinetics. Mineral dissolution, saturation constraints in dissolution, the degree of saturation, partial pressures of CO2, reaction kinetics, and the residence time of the groundwater flow play different roles in determining the spatial distribution of ionic constituents. Simultaneous evaluation of several geochemical processes permits the study of interdependent phenomena such as shifts in equilibrium concentrations resulting from the addition of common ions by cation exchange or sulfate reduction processes. The utility of the model was demonstrated by applying it to the groundwater reservoir in the Upper Kettle Creek, Ontario, Canada, where a favorable comparison was achieved between the real and the theoretical hydrochemical patterns. CHLORIDE BALANCE OF SOME FARMED AND FORESTED CATCHMENTS IN SOUTHWESTERN AUSTRALIA,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia).
A. J. Peck, and D. H. Hurle.
Water Resources Research, Vol 9, No 3, p 648-657, June 1973. 1 fig, 5 tab, 25 ref.

Descriptors: *Saline water, *Leaching, *Salt balance, *Australia, Water quality, Water chemistry, Water balance, Chlorides, Vegetation effects, Land use, Water pollution sources, Saline soils.

Loss of chloride in streamflow from forested catchments in southwestern Australia is only slightly greater than the total annual input from rain and dust. However, salt flow from catchments in which a significant area of the forest vegetation has been cleared for farming is much larger and exceeds salt input by up to 690 kg/ha per yr, or a factor of 21. The net loss of Cl results from decreased storage in catchment soil water. Removal of the forest vegetation increases groundwater discharge of catchments by amounts ranging from about 1 to 13 cm per yr. Characteristic times for equilibration of Cl input and loss on farmed catchments are estimated to range from 30 to 400 years. In equilibrium the salty streams draining farmed catchments would yield water with Cl concentrations acceptable for drinking. (Knapp-USGS)

INORGANIC PHOSPHORUS IN SEAWATER,
Geological Survey, Menlo Park, Calif.
R. A. Gulbrandsen, and C. E. Roberson.
In: Environmental Phosphorus Handbook, E. J. Griffith, A. Beeton, J. M. Spencer and D. T. Mitchell editors: John Wiley and Sons, Inc, New York, N. Y., p 117-140, 1973. 5 fig, 9 tab, 44 ref.

Descriptors: *Phosphorus, *Sea water, *Oceans, *Water chemistry, *Chemical analysis, Water analysis, Phosphorus compounds, Inorganic compounds, Phosphates, Data collections, Atlantic Ocean, Pacific Ocean, Indian Ocean, Nutrients, Marine plants, Mixing, Ocean currents.
Identifiers: Phosphoric acid.

The concentration of phosphorus in seawater is very small, an average of about 2.3 microgram atoms of phosphorus per liter. This is inorganic phosphorus, as contrasted with organic forms, and is the dominant mode of phosphorus occurrence in seawater. The inorganic phosphorus occurs nearly entirely as orthophosphate ions; traces of polyphosphates have been reported and are considered as a possible indicator of pollution. Because phosphorus is one of the elements essential to all forms of life, it is one of the basic nutrient elements, the so-called nonconservative elements in seawater whose proportions with respect to such major constituents as sodium and chlorine are not constant. Interocean mixing, estimated to occur within a time period of about 1000 years, accounts for the nearly constant proportions of the conservative elements in seawater. Most chemical determinations of phosphorus in seawater are of inorganic orthophosphate; however, total phosphorus determinations, which include the organic forms, have been made frequently in recent years. Vertical distributions of phosphorus are tabulated for some of the world's oceans and seas. (Woodard-USGS)

TEST RESULTS OF SIX-MONTH TEST OF TWO WATER ELECTROLYSIS SYSTEMS,
McDonnell Douglas Astronautics Com., Huntington Beach, Calif. Biotechnology and Power Dept.
E. S. Mills, and G. W. Wells.
Available from NTIS, Springfield, Va 22151 N73-11095, Price $30.00 printed copy. National Aeronautics and Space Administration Contract Report 128629, October 1972. 541 p, 182 fig, 13 tab, 6 ref. NAS9-12048.

Descriptors: *Electrolysis, *Satellites (Artificial), *Temperature control, Equipment, Testing procedures, Pressure, Oxygen, Monitoring, Computer programs, Evaluation, Water chemistry, Design criteria.
Identifiers: *Water electrolysis systems, *Space stations, NASA, Manned spacecraft.

Two water electrolysis systems used in the NASA space station simulation 90-day manned test of a regenerative life support system at the McDonnell Douglas Astronautics Company were refurbished as required and subjected to 26 weeks of testing. The two electrolysis units are both promising systems for oxygen and hydrogen generation and both needed extensive long-term testing to evaluate the performance of the respective cell designs and provide guidance for further development. These units have been considered seriously in the space station prototype environmental thermal control and life support program. The static vapor feed unit uses a vapor feed and intermittent circulation of electrolyte. The circulating electroyte unit uses a liquid supply with continuous electrolyte circulation. Testing was conducted to evaluate performance in terms of current, pressure, variable oxygen demands, and orbital simulation. An automatic monitoring system was used to record, monitor, and print performance data at one-minute, ten-minute, or one-hour intervals. Performance data are presented for each day of system operation for each module used during the day. Failures are analyzed, remedial action taken to eliminate problems is discussed, and recommendations are made for redesign of future space applications. (Woodard-USGS)

COLLECTION OF PAPERS OF THE HYDROMETEOROLOGICAL OBSERVATORY OF THE BLACK SEA AND SEA OF AZOV BASINS (SBORNIK RABOT BASSEYNOVOY GIDROMETEOROLOGICHESKOY OBSERVATORII CHERNOGO I AZOVSKOGO MOREY).
Basseinovaya i Gidrometeorologicheskaya Observatoriya Chernogo i Azovskogo Morei, Sevastopol (USSR).

A. I. Simonov, editor, Leningrad, 1970, No 8. 87 p.

Descriptors: *Water chemistry, *Sea water, *Inorganic compounds, Salts, Carbon dioxide, Nitrogen compounds, Phosphorus compounds, Organic matter, Productivity, Biomass, Flow, Currents (Water), Winds, Biology, Biochemistry, Dimensions, Seasonal, Annual, Variability, On-site investigations.
Identifiers: USSR, *Black Sea, *Sea of Azov, Silicon, Organic carbon, Mineralization.

Results are presented of investigations of the hydrologic regime of the Black Sea and Sea of Azov. The dynamics of biogenous elements in the seas is examined, and studies are made of currents in the northwestern region of the Black Sea, carbon dioxide in waters of Yalta Bay, exchange of nutrient salts through the Kerch Strait, and organic-matter accumulation in brines and bottom sediments of eastern Sivash lagoons. DYNAMICS OF SILICON IN THE BLACK SEA AS OBSERVED ALONG THE CAPE KHERSONES-BOSPORUS PROFILE (DINAMIKA KREMNIYA V CHERNOM MORE PO MATERIALAM NABLYUDENIY NA RAZREZEMYS KHERSONES--PROLIV BOSFOR),
Basseinovaya i Gidrometeorologicheskaya Observatoriya Chernogo i Azovskogo morey, Sbornik rabot, No 8, p 22-29, Leningrad, 1970. 3 fig, 6 tab, 7 ref.

Descriptors: *Water chemistry, *Inorganic compounds, *Sea water, *Silica, Salinity, Depth, Profiles, Currents (Water), Phytoplankton, Seasonal, Variability, Analytical techniques.
Identifiers: USSR, *Black Sea, *Silicon.

Distribution of silicon in the Black Sea was investigated to depths of 150 m along the Cape Khersones--Bosporus profile in 1962-67. Observations in January 1962 and February 1965 showed that the silicon content is higher in winter than during other seasons of the year. Average silicon concentrations at the sea surface reached 1,180 micrograms/liter in January and decreased to 850 micrograms/liter in February. The average value in March was 750 micrograms/liter. The silicon content in August averaged 550-650 micrograms/liter and increased in November to 900-950 micrograms/liter. The concentration of silicon is relatively uniform to a depth of 20 m and increases at depths ranging from 50 m to 150 m. The profile distribution of silicon is a dome-shaped isosurface produced by a closed system of circular currents and clearly reflected in the silicon to salinity ratio. (See also W73-10779) (Josefson-USGS)

Descriptors: *Water chemistry, *Sea water, *Salts, *Phosphates, *Nitrogen compounds, Nitrites, Nitrates, Ammonium salts, Seasonal, Annual, On-site investigations, Silica.
Identifiers: USSR, *Kerch Strait, Black Sea, Sea of Azov, Silicon.

Seasonal, annual, and average long-term exchange of nutrient salts between the Black Sea and Sea of Azov through the Kerch Strait was investigated in hydrochemical studies conducted in 1953-65. The amounts of nutrient salts transported annually from the Sea of Azov into the Black Sea included 352 metric tons of phosphates, 30,000 metric tons of silicon, and 1,055 metric tons of nitrites and nitrates. The amounts of nutrient salts flowing annually into the Sea of Azov from the Black Sea included 137 metric tons of phosphates, 25,000 metric tons of silicon, and 133 metric tons of nitrites and nitrates. The annual loss of nutrient salts from the Sea of Azov was 6,000 metric tons. (See also W73-10779) (Josefson-USGS)
W73-10781

DYNAMICS OF MINERAL AND ORGANIC PHOSPHORUS IN THE SEA OF AZOV AFTER REGULATION OF DON RIVER FLOW (DINAMIKA MINERAL'NOGO I ORGANICHESKOGO FOSFORA V AZOVSKOM MORE POSLE ZAREGULIROVANIYA STOKA REKI DONA),
Basseinovaya i Gidrometeorologicheskaya Observatoriya Chernogo i Azovskogo Morei, Sevastopol (USSR).
S. A. Nazarenko.
In: Basseynovaya gidrometeorologicheskaya observatoriya Chernogo i Azovskogo morey, Sbornik rabot, No 8, p 64-72, Leningrad, 1970. 4 tab, 8 ref.

Descriptors: *Water chemistry, *Phosphates, *Organophosphorus compounds, *Sea water, *Regulated flow, Regulation, Discharge (Water), Biology, Biochemistry, Annual, Seasonal, Variability.
Identifiers: USSR, *Sea of Azov, *Don River, Gulf of Taganrog, Mineralization.

The dynamics of mineral and organic phosphorus in the Sea of Azov was investigated in 1953-66 following regulation of flow of the Don River. In 1953-61, the phosphate content in the open sea was 10 micrograms/liter, while that in the Gulf of Taganrog was 20 micrograms/liter. In 1962-66, the phosphate content decreased to 7 micrograms/liter in the sea and to 13 micrograms/liter in the gulf. In 1958-61, the content of organic phosphorus in the open sea was 70 micrograms/liter, while that in the gulf was 87 micrograms/liter. In 1962-66, the content of organic phosphorus increased slightly, averaging 77 micrograms/liter in the sea and 106 micrograms/liter in the gulf. Annual variations in phosphorus content are associated with biochemical and biological processes in the sea and, to a lesser extent, with river discharge fluctuations. ORGANIC MATTER IN THE EASTERN SIVASH (ORGANICHESKOYE VESHCHESTVO V VOSTOCHNOM SIVASHE),
Basseinovaya i Gidrometeorologicheskaya Observatoriya Chernogo i Azovskogo Morei, Sevastopol (USSR).
Yu. G. Slatinskiy.
In: Basseynovaya gidrometeorologicheskaya observatoriya Chernogo i Azovskogo morey, Sbornik rabot, No 8, p 73-82, Leningrad, 1970. 2 tab, 17 ref.

Descriptors: *Organic matter, *Brines, *Bottom sediments, Sedimentation, Lagoons, Islands, Productivity, Biomass, Phytoplankton, Cladophora, Benthos, Depth, Areal, Volume.
Identifiers: USSR, *Sivash, Organic carbon, Water exchange, Mineralization.

The amount of organic matter in brines and bottom sediments of eastern Sivash lagoons in the Crimea is extremely high. The average daily production of organic carbon from 24,000 metric tons of organic matter is 8 mg/liter. The annual accumulation of organic matter is about 13 million metric tons, of which 3.9 million metric tons becomes bottom sediment and 8.65 million metric tons remains in a suspended, colloidal, and dissolved state. A layer 2 mm-thick forms annually as a result of the sedimentation of organic substances. (See also W73-10779) (Josefson-USGS)

COMPARISON OF FLAME AND FLAMELESS ATOMIC ABSORPTION FOR THE DETERMINATION OF CALCIUM,
Cold Regions Research and Engineering Lab., Hanover, N.H.
J. H. Cragin, and M. M. Herron.
Atomic Absorption Newsletter, Vol 12, No 2, p 37-38, March-April 1973. 1 fig, 2 tab, 5 ref.

Descriptors: *Calcium, *Methodology, *Snow, *Aqueous solutions, Chemical analysis, Pollutant identification.
Identifiers: *Atomic absorption spectrophotometry, *Flameless atomic absorption spectrophotometry, Precision, Detection limits, Absorbance, Sensitivity, Graphite furnace.

Select glacial snow samples from Greenland were analyzed for calcium by both flame and flameless atomic absorption in order to compare the suitability of these techniques. A Perkin-Elmer Model 303 atomic absorption spectrophotometer and a single-element Ca Intensitron hollow cathode lamp were used. Flameless absorption values were obtained with an HGA-70 Graphite Furnace which was modified to interrupt the inert gas flow during atomization. Comparisons of the results from the two methods showed good agreement in reference to standard deviations. The addition of 0.1 percent La to samples gave no increase in absorbance indicating the absence of interferences for flame determinations. Consequently all flame measurements were performed without this additive. Precision was appreciably better with the graphite furnace: average standard deviations are 1.9 micrograms/l for the flame and 0.3 microgram/l for the furnace. Flame and flameless atomic absorption determinations of calcium compare well in the 5 to 20 micrograms/l range. Below 5 micrograms/l calcium, the Graphite Furnace because of its improved precision is preferred to the flame. (Holoman-Battelle)

Descriptors: Methodology, Chemical analysis, *Water analysis, *Brines, *Heavy metals, *Trace elements, *Groundwater, Saline water, Manganese, Iron, Nickel, Copper, Cobalt, Chromium, Molybdenum, Lead, Cadmium, Solvent extractions, Pollutant identification, Water pollution.
Identifiers: *Heated graphite atomizer, *Flameless atomic absorption spectrophotometry, Sensitivity, Accuracy, Detection limits, Standard addition technique, Precision, Chemical interference.

A satisfactory procedure for the determination of trace metals in natural waters, based on the use of the heated graphite atomizer (HGA) has been developed. Mn, Fe, Ni, Cu, Co, Cr, Mo, Pb and Cd were investigated in water samples varying from dilute groundwaters to brines. Sample sizes were 10, 20, 50 or 100 microliters and the sample was injected into the furnace in triplicate by applying a constant pressure. Measurements were made using the standard calibration curve and the standard addition procedures. The overall precision varied between plus or minus 5 percent to plus or minus 10 percent at the 10 micrograms/l level; precision for Cu, Co, Mn, Mo and possibly Ni was better than for the other elements. The sensitivity achieved was in general comparable with that quoted for the HGA by other workers, except for cadmium which is approximately ten times less sensitive. The detection limits shown for Co, Cr, Cu, Mn, Mo and Pb are generally of the same order as those quoted by the manufacturers, whereas the limit for Ni is slightly better. Relatively similar detection limits are obrained by solvent extractions. The results of solvent extraction and direct flame analyses of Cyprus groundwater samples showed good agreement in terms of accuracy of the method. (Holoman-Battelle)

SEDIMENT TRANSPORT BY STREAMS DRAINING INTO THE DELAWARE ESTUARY,
Geological Survey, Philadelphia, Pa.
L. J. Mansue, and A. B. Commings.
Geological Survey open-file report, 1973. 30 p, 2 fig, 5 tab, 18 ref.

Descriptors: *Sediment transport, *Sediment yield, *Sediment load, *Delaware River, Environmental effects, Urbanization, Urban hydrology, Data collections, Geology, Topography, Land use, Suspended solids, Sedimentation, Erosion, River basins, Watershed management, Pennsylvania, New Jersey, Delaware.
Identifiers: *Delaware River basin.

The quantity of sediment transported by streams draining into the Delaware estuary from Pennsylvania, New Jersey, and Delaware varies really according to geology, physiography, and land use. Of the estimated total sediment load of 1.6 million tons entering the Delaware estuary annually, about 49% is contributed by the Delaware River main stem, 34% by Pennsylvania tributaries, and 17% by New Jersey and Delaware tributaries. The highest sediment yielding basins are in the Piedmont province in Pennsylvania and Delaware, where sediment yields range from 100 to 1,000 tons per sq mi annually. Inner Coastal Plain basins in New Jersey and Delaware have a sediment yield of from 50 to 250 tons per sq mi annually. Basins carrying the least sediment per square mile are located in the outer coastal plain in southern New Jersey and Delaware. Yields in these stream basins range from 5 to 10 tons per sq mi annually. Streams' draining areas in the development phases of urbanization, where exposure of soils by earthmoving related to highway or new housing construction, have yields two to four times higher than those in adjacent nonurban or stable urban areas. Descriptors: *Saline water intrusion, *Estuaries, *Mathematical models, *Tidal effects, Velocity, Salinity, Flow profiles, Flow rates, Flumes, Input-output analysis, Equations, Correlation analysis, Saline water-freshwater interfaces, Analytical techniques.

A mathematical model is developed using analytical techniques to determine the longitudinal and vertical distributions of velocities and salinities, averaged over a tidal period, for mixed but partially stratified estuaries. The flow field is assumed laterally homogeneous and the estuary width and depth are assumed to be functions of the longitudinal coordinate only. Required inputs to the model include the salt intrusion length, the ocean boundary salinity, the distribution of the depth-averaged salinity, and the freshwater discharge. The governing equations are the vertical and longitudinal equations of motion, continuity, salt conservation, and an equation of state. The key assumption is that the longitudinal salinity gradient is independent of depth. This decouples these equations and thus permits an analytical solution. Using data from laboratory flume tests from the U. S. Army Waterways Experiment Station and the Delft Hydraulics Laboratory, and field surveys from the James River Estuary in Virginia, the model solutions are used to find correlations for the mean vertical transfer coefficients of mass and momentum with gross characteristics of the estuary. These correlations, plus the results from a one-dimensional numerical model, permit this analytical model to be used as a predictor of the velocity and salinity profiles in estuaries and to relate changes in freshwater discharge to possible changes in the location of shoaling zones. A TWO-LAYER MODEL OF MUD TRANSPORT IN THE THAMES ESTUARY,
Hydraulics Research Station, Wallingford (England).
N. V. M. Odd, and M. W. Owen.
Institution of Civiel Engineers Proceedings Paper 7517 S, Supplement 9, 1972. 30 p, 13 fig, 1 tab, 17 ref.

Descriptors: *Sediment transport, *Mud, *Estuaries, *Stratified flow, *Mathematical models, Saline water intrusion, Saline water-freshwater interfaces, Density stratification, Tides, Currents (Water), Mixing, Suspended load, Flood control, Dams.
Identifiers: *Thames Estuary (England).

A two-layer mathematical model simulates mud transport in a well-mixed estuary. The main purpose of the model is to simulate mud transport processes and the effects on the regime of siltation of continuous operation of various tidal barriers proposed for flood protection in the Thames Estuary. A method is given for calculating two-layer tidal flow with internal gravitational circulation induced by density gradients. Methods for calculating the rates of erosion and deposition of mud are based on field and laboratory experiments. The application of the method characteristics is used to solve the mass balance equations for the transport of mud suspended in two-layer flow. (Knapp-USGS)

OCEAN UTILIZATION AND COASTAL ZONE DEVELOPMENT.
Massachusetts Inst. of Tech., Cambridge. Sea Grant Project Office.

Report No MITSG 73-3, 1973. 29 p, 12 ref. NOAA GH-88.

Descriptors: *Coasts, *Resources, *Management, Research, Engineering, Education, Harbors, *Estuaries, Model studies, Transportation, Mineralogy, Proteins, Oil, Oxidation, Bacteria, *Water pollution control, Resource development.
Identifiers: Sea Grant activities.

Sea grant activities of the Massachusetts Institute of Technology from June 1, 1970 to June 30, 1972 are summarized. Research projects include: new dimensions of U.S. marine policy, estuary modeling, ocean transportation, the future of Atlantic ports, squid protein concentrate; and oil oxidation by marine bacteria. Education and training projects encompass: power, pollution, and public policy; ocean engineering; marine transportation; and evolution and utilization of marine mineral resources. (Ensign-PAI)

A STUDY OF THE PROBABLE EFFECTS OF THE DIVERSION OF FLOOD WATERS UPON THE ECOLOGY OF THE CONNECTICUT RIVER ESTUARY,
Connecticut Univ., Storrs.
M. J. Westerfield, and W. C. Kennard.
In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area, Massachusetts Water Resources Research Center, Publication No. 25, 1973, Appendix F, 23 p, 3 fig, 1 tab, 42 ref. OWRR C-2169 (No. 3377) (1).

Descriptors: *Ecology, *Estuarine environment, Water quality, Flood flows, *Diversion, Temperature, Salinity, Nutrients, Turbidity, Zooplankton, Phytoplankton, Ecosystem, *Inter-basin transfers.
Identifiers: *Connecticut River Estuary.

The ecology of the Connecticut River estuary and the possible effects of the diversion of flood waters out of the basin are described. Emphasis is placed on describing the predominant characteristics of the ecosystem in the tidal stretch of the Connecticut River, including its bacteriology, phytoplankton, zooplankton, and fish populations; identifying factors such as river flow, salinity, temperature, turbidity, and nutrients which are key determinants of the nature of the ecosystem; and predicting possible changes in these factors as a result of the flood water diversions. Several changes such as higher temperatures, increased salinity, decreased flows and water currents, and more deposited solids are discussed. Each of these changes by itself may not be significant but the combined effect may significantly change the estuarine ecosystem. However, a thorough study of the estuary is needed before a proper evaluation can be made. (See also W73-10726). (Elfers - North Carolina).

DIURNAL VERTICAL MIGRATION OF AN ESTUARINE CLADOCERAN, PODON POLYPHEMOIDES, IN THE CHESAPEAKE BAY,
Johns Hopkins Univ., Baltimore, Md. Chesapeake Bay Inst.
H. P. Bosch, and W. R. Taylor.
1972, 29 P. 7 FIG, 19 REF. AEC AT (30-1)3497 and AT (11-1)3279.

Descriptors: *Diurnal, *Vertical, *Migration, *Estuaries, *Crustaceans, Chesapeake Bay, Zooplankton, Tides, Light, Currents (Water).
Identifiers: *Podon polyphemoides.

Quantitative pump samples of Chesapeake Bay zooplankton, made to determine whether the cladoceran, Podon polyphemoides, changed its position in the water column with respect to time, indicated that a downward migration occurred shortly before sunset and an upward migration before dawn. A similar three day study a year later confirmed the results and showed that the podonids (all asexual females) were not impeded in their migration by saline or pycnal stratification. The level to which the population rises within the water column may be dictated by ambient light. Day and night plankton samples taken along the axis of the bay showed the vertical migratory pattern of the podonids to be a general phenomenon throughout the estuary. It is thought that the downward component of the migration, shown to be diurnal behaviour and independent of the tidal cycle, is due to passive sinking attending a decrease in swimming activity. The vertical migration of the podonids from the upper part of the two-layered circulation during the night returns individuals advected seawards during the day. This behaviour is probably an important factor in allowing this species to maintain its large populations within the dynamic estuarine environment. (Jones-Wisconsin)

Available from NTIS, Springfield, Va 22151 as COM-73-10205 Price $3.00 printed copy; $0.95 microfiche. College of Marine Studies Report DEL-SG-11-72, December 1972. 13 p, 7 tab, 7 ref. (Reprint from Advances in Organic Chemistry, p 415-425, 1971). NOAA Grant GH-109.

Descriptors: *Sediments, *Carbohydrates, *Bays, Sampling, Data collections, Marshes, Gulfs, Coasts, Delaware, New Jersey, Mexico, Correlation analysis, Evaluation, Geochemistry, Bottom sediments, Organic compounds.
Identifiers: *Bottom sediment sugars.

Carbohydrate components of cores of sediments from Broadkill Marsh, Delaware, Delaware Bay, and from 1,210 fathom depth in the southern Gulf of California include a variety of free sugars and polymeric sugars, the latter including small amounts of recognizable polysaccharide structures. Free sugars in peat and tidal-marsh silts of Broadkill Marsh form generally 5% or less of the total sugars and consist mainly of glucose. In the fine silty and clayey sands of lower Delaware Bay glucose also is the principal free sugar but comprises 20%-50% or more of the total extractable sugars. Free sugars in the radiolarian-diatom-foraminiferal clays of the Gulf of California are richer than in the marsh and bay sediments but are only 1%-2% of the total sugars in the gulf sediments. Monosaccharides extracted with acid from these sediments probably occurred in some polymeric form but mainly not as identifiable polysaccharides. In the Boradkill Marsh silts and peat such sugars range from 0.2 to 6.8 mg/g and include galactose, clucose, mannose, arabinose, xylose, ribose, rhammose, and rarely maltose. Diatoms, marine algae and marsh grasses (Distichlis, Spartina, and Phragmites) have been the principal source material. Polymeric sugars in Delaware Bay sediments are less than in the marsh sediments and range from 0.06 to 0.26 mg/g. Marsh grass debris, marine algae, and diatoms also appear to have been the source for the bay sediment sugars. The polymeric sugars of Gulf of California sediments average quite high and range from 1.8 to 3.4 mg/g. The source of this material is apparently settled plankton and perhaps some contribution from land plants that have floated to sea. The preservation of so much carbohydrate material in the deepwater sediments is surprising in view of the distance it has to settle. (Woodard-USGS)

TIDAL CURRENTS AND ZIG-ZAG SAND SHOALS IN A WIDE ESTUARY ENTRANCE,
Old Dominion Univ., Norfolk, Va.
J. C. Ludwick.
Available from NTIS Springfield, Va 22151 AD-755 735, Price $3.00 printed copy; $0.95 microfiche. Institute of Oceanography Technical Report No 7, January 15, 1973. 102 p, 22 fig, 9 tab, 44 ref, 3 append. ONR-GP Contract N00014-70-C-0083.

Descriptors: *Sedimentation, *Inlets (Waterways), *Estuaries, *Chesapeake Bay, *Tidal effects, Tides, Flow rates, Sediment transport, Sediment distribution, Shoals, Environmental effects, Levees, Data collections.

Fourteen 27-hour tidal current stations were maintained in the entrance to Chesapeake Bay in a 40 sq mi area of subtidal sand banks and channels where the average water depth is 21 feet. At ebb strength, surface current speed ranged from 4.33 to 2.11 ft/sec; near-bottom speed ranged from 2.56 to 0.73 ft/sec. At flood strength, surface current speed ranged from 3.43 to 1.86 ft/sec; near-bottom speed ranged from 2.12 to 1.15 ft/sec. Near the bottom at most stations, floodflow dominates over ebb flow in both peak speed and duration. Net transport of bed sediment is generally ebb directed. Zig-zag shoals extend from the north cape, three-fourths of the distance to the south across the entrance. This line of shoals is comprised of oppositely opening sinuses, or parabolas, which are with distance to the south alternately ebb dominated and flood dominated. The shoals represent spit building action in the presence of strong reversing tidal currents. Other shoals in the entrance are due to subaqueous levee building marginal to main channels. Still other shoals in the entrance are constructed when a flood-dominated channel intersects the ebb-directed path of net sediment transport, the entrapped sediment then being flushed landward to form a secondary shoal when spreading of the flood current occurs. 03. WATER SUPPLY AUGMENTATION AND CONSERVATION

3A. Saline Water Conversion

DESALINATION PLANT,
Auscoteng Pty Ltd., Wayville, (Australia). (assignee).
N. L. Foley.
U. S. Patent No. 3,725,206, 3 p, 1 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 301, April 3, 1973.

Descriptors: *Patents, *Desalination, *Evaporators, *Condensation, *Heat exchange, Seawater, Brine, Separation techniques, Potable water, Equipment.

This desalination plant comprises an evaporator having a condenser within it for heat exchange purposes. The water to be desalted is drawn by means of a low pressure system from a supply tank through a heat exchange tank. The water finally enters the evaporator through an air separation chamber. The air separation chamber is connected by a line and a heat exchanger to a brine pump. The pump serves to draw off any air which enters the system with the water and at the same time draws off a quantity of brine. A blower is used to provide heat of compression and to establish a vapor flow from the evaporator to the condenser and to establish a lesser degree of high vacuum within the condenser so that the latent heat of vaporization of a fluid condensing will flow from the condenser into the saline water. (Sinha-OEIS)
W73-10589

MULTIPLE EXPANSION FLASH EVAPORATOR COMPRISING A CONTINUOUS CASING WITH A CENTRAL EVAPORATION CHAMBER,
Societa Italiana Resine S.p.A, Milan (Italy). (assignee)
D. Barba, C. D'Agostino, and G. Liuzzo.
U. S. Patent No 3,720,586, 2 p, 3 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 908, No 2, p 427, March 13, 1973.

Descriptors: *Patents, *Desalination, *Condensation, Sea water, Potable water, Evaporation, Water treatment, Equipment, *Heat exchangers, *Flash distillation.
Identifiers: *Evaporation chambers.

A multiple expansion flash evaporator comprises a continuous casing, vertical longitudinal baffles dividing the casing into a central evaporation zone

and two side condensation zones in communication with the central zone. A number of vertical transverse baffles divides the evaporator into a succession of expansion chambers with flow openings between them. A multi-tube heat exchanger runs the length of each condensation zone. (Sinha-OEIS)

F. E. Busby, Jr., and J. L. Schuster.
Texas Water Development Board, Austin, Report 168, April 1973. 41 p, 12 fig, 6 tab, 15 ref, 6 append.

Descriptors: *Water loss, *Phreatophytes, *Texas, *Arid lands, Data collections, Aerial photography, Remote sensing, Aircraft, On-site investigations, Correlation analysis, Meteorological data, Precipitation (Atmospheric), Evaporation, Temperature, Vegetation, Cottonwoods, Mesquite, Rivers, Lakes, Flood plains, Water yield improvement, Soil-water-plant relationships.
Identifiers: *Brazos River (Tex), Possum Kingdom Lake, *Saltcedar.

In the arid western part of Texas, phreatophytes along streams remove large quantities of water from a very limited supply. The increase in area and density of these plants over the years, and the resultant increase in their water consumption, are of concern to the Texas Water Development Board. Woody phreatophyte vegetation was inventoried along the Brazos River upstream from Possum Kingdom Lake to the confluence of the Double Mountain and Salt Forks. The kinds, amounts, distribution, history of spread, and volume density of the phreatophytes were determined along with their relation to flood-plain location. Saltcedar is the most widely distributed phreatophyte in the study area, and usually occurs in a dense stand adjacent to the river channel. It dominated 18 precent of the river flood plain in 1940, increasing to 28 percent in 1950 and 36 percent in 1969. Mesquite occurs on the outer portion of the flood plain, and occurs extensively where the flood plain is wide. It has spread slightly toward the river channel, invading 760 additional acres from 1940 to 1969. Average volume density is 27%, and total growth is equivalent to 2,181 acres at 100% volume density. (Woodard-USGS)
W73-10745

CONVERTING CHAPARRAL TO GRASS TO INCREASE STREAMFLOW,
Forest Service (SDA), Tucson, Ariz. Rocky Mountain Forest and Range Experiment Station.
P. A. Ingebo.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 181-192, 1972. 5 fig.

Descriptors: *Chaparral, *Grasses, *Streamflow, *Water supply, *Water harvesting, Surface waters, Watershed management, Forest management, Rainfall-runoff relationships, Treatments, Arizona, Arid lands.

Chaparral covers 4 million acres in Arizona. There is interest in determining how much these lands contribute to surface water supply, and how this contribution could be changed by conversion of chaparral cover to grass or grass forb. Results from treatment in the Whitespar watersheds are interpreted. Live oak and true mountain mahogany dominate the study area, which averages 22.7 inches of annual precipitation. Whitespar B watershed was converted to grasses in 1967, and litter was not disturbed. The 246 acre watershed produced more streamflow than the untreated, 303-acre control which tended to remain intermittent. Prior to treatment, streamflow in both watersheds was quite well synchronized. Watershed B has since had continual flow. Winter flows contribute about 77 percent of the increased streamflow volume. The degree of effect is still under study, but a new rainfall-runoff relationship for the treated watershed is necessitated. (See also W73-10818) (Popkin-Arizona)
W73-10831

WEATHER MODIFICATION IN ARIZONA, 1971,
Agricultural Research Service, Tucson, Ariz. Southwest Watershed Research Center.
H. B. Osborn.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 193-207, (1972). 14 ref.

Descriptors: *Weather modification, *Thunderstorms, *Cloud seeding, *Analysis, *Clouds, Winds, Rainfall, Precipitation (Atmospheric), Arizona.

There have been many efforts in recent years to modify thunderstorms through cloud seeding. Collective cloud seeding efforts in Arizona before 1971 are reviewed and an operational convective cloud seeding program carried out in Arizona in the summer of 1971 is analyzed. The comprehensive Santa Catalina Cloud Seeding Experiment (1957 to 1964) was a randomized seeding using silver iodide. Results of this experiment are uncertain as numerous interpretations are possible. Numerous individual experiments from 1966 to 1970 at Flagstaff were conducted, with uncertain results. An intensive program of seeding individual cumulus clouds with silver iodide was carried out in the summer of 1971 in central and eastern Arizona. No statistically significant changes were noted. Results of the Catalina Experiment imply that seeding decreased rainfall on and downwind from the target. Two other experiments were inconclusive. Nine figures show precipitation patterns. BENEFICIAL AQUATIC PLANTS IN COASTAL AREAS,
Army Engineer District, Mobile, Ala.
H. McClellan.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 31-36, 1972. 5 ref.

Descriptors: *Aquatic plants, *Estuaries, *Tidal marshes, *Coastal marshes, Productivity, Algae, Bacteria, Periphyton, Diatoms, Ecosystems, Biological communities, Florida, Mangrove swamps, Benthic flora, Detritus, Bayous, Plant populations, Grasses.
Identifiers: *Atlantic coast, *Gulf coasts, Sea grass beds.

Coastal zone plants whose productivity is due to autochtonous material are described. Along the edge of the coastal zone is the tidal marsh, a most dynamic unit of nature. The marsh also functions for many purposes, including dumping, industries, boat channels, meadow hay, mosquitoes, spawning, fish food factories, spots for waterfowl, and beautiful shore scenes. On the Atlantic and Gulf coasts, the grasses, Spartina alterniflora and S. patens, dominate. The first grows where currents are strong and the latter, used as hay, forms a carpet on the flats. The black rush, Juncus roemerianus, forms broad expanses on high marsh in southern areas and J. gerardii in northern marshes. Distichlis spicata, a short fine grass, grows in more waterlogged spots of high marsh; Salicornia lives on the salt marsh proper. In south Florida, mangrove begins to replace Spartina. On bottoms of ponds and bayous occur benthic algae and bacteria whose nitrogen-fixing is important. Benthic algae are grazed by herbivorous fishes. Sea grass beds afford cover for organisms. Actually the detritus is of major importance within the coastal zone. Caostal zone plant control should be approached cautiously. (See also W73-10951) (Jones-Wisconsin)
W73-10955

MECHANICAL EQUIPMENT 'WEED WITCH' FOR AQUATIC PLANT CONTROL,
Army Engineer Div. South Atlantic, Atlanta, Ga.
J. J. Raynes.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 37-39, 1972.

Descriptors: *Aquatic weed control, *Mechanical equipment, Maryland, Turbidity, Operating costs, Construction costs, Performance.
Identifiers: *'Weed Witch', Severn River (Md).

The 'Weed Witch' is a piece of mechanical equipment for controlling aquatic vegetation; by disturbing the bottom sediment, it uproots the vegetation. It consists primarily of pumps connected to a multiple header system of vertical plastic pipes terminating in high pressure jets or spray heads adjusted as needed for positioning near the river bottom. The uprooted plants generally float and are moved out by river currents. The pertinent structural facts, the costs of operation and construction, the method of operation, and effectiveness are given. It is not without limiting factors, for it requires relatively flat bottoms without underwater obstructions such as stumps, debris, and piles. The disposal of uprooted aquatics could create problems if allowed to disperse by natural currents or to deposit on shore, particularly in highly populated and

UNIVERSITY OF ILL. URBANA-CHAMPAIGN

developed areas. Fragments of many of the underwater aquatic plants will spread and create new colonies of growth unless they are in close proximity and are transported by river currents to high saline waters which are generally toxic to most problem aquatic plants. In operation, the stirring of the bottom causes the water to become very turbid and muddy. (See also W73-10951) (Jones-Wisconsin)
W73-10956

SUMMARY OF CO2 LASER-WATER HYACINTH LABORATORY RESEARCH,
Athens Coll., Ala. Dept. of Biology.
R. W. Couch.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 41-45, 1972.

Descriptors: *Aquatic weed control, *Radiation, *Water hyacinth, Electromagnetic waves, Light intensity, Plant morphology, Pigments, Irradiation, Plant growth, Photosynthesis, Chlorophyll, Inhibition.
Identifiers: *Carbon dioxide laser, Hill reaction, Neodymium laser, Duckweed, Laser.

A nitrogen-carbon dioxide-helium laser system for control of aquatic weed growth was demonstrated. Water hyacinth plants were most affected. No anatomical damage could be found in either fresh nor in prepared stained sections, although there seemed to be a faster disintegration of tissues associated with the plant's photosynthetic mechanism than for surrounding tissues. Several trends were apparent. Both plant counts and dry matter wrights led to the conclusion that at least 0.5-joule/sq cm carbon dioxide laser energy was necessary to obtain inhibition of plant growth. The C-14 dioxide-fixation studies showed the lower threshold of energy necessary for plant growth inhibition was somewhat higher than the 0.5-joule/sq cm rate, but less than 4.4-joule. Evidence showed that reirradiation did not appreciably improve control. Physiological studies showed that the laser radiation was inhibiting light reaction phase of photosynthesis rather than dark reaction phase. Reduction was apparently brought about by inhibition of production of the photosynthetic pigments responsible for conversion of light energy to chemical energy. Another experiment was conducted with water hyacinths using a neodymium laser. The effects of 10.6 micron laser energy on duckweed indicated excellent control at the 10-joule/sq cm radiation rate. (See also W73-10951) (Jones-Wisconsin)
W73-10957

FIELD LASER,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. L. Decell.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 47-50, 1972. 1 fig.

Descriptors: *Aquatic weed control, *Plant growth, *Water hyacinth, Inhibition, Prototypes, On-site tests, Costs, Nutrients, Irradiation, Plant physiology.
Identifiers: Lasers, Waterways Experiment Station.

A prototype of a field carbon dioxide laser is being planned to evaluate its control of water hyacinth growth. Two basic types were considered and the Electric Discharge Convection Laser proved to be more economical to construct and operate. Data have been analyzed in an effort to isolate the variables contributing to growth reduction of the irradiated water hyacinths. A validated growth curve has been generated from a separate data source and an equation has been written for this curve. Using this curve as a base of reference, comparisons are being made with data from the Athens College, Alabama, experiments to determine the magnitude of influence of certain variables that are believed to be contributing to the reduction in growth. The final result of this analysis will be a multiple regression equation that considers the following variables: number of dead plants, regeneration, dry matter weight, nutrient levels, and radiated energy. Outside of studies dealing with the water hyacinth's physiology, there is very little quantitative information that indicates its reaction to varying environmental conditions. There still exists a need for some additional basic laboratory experiments to augment data from the Athens-Redstone experiments. (See also W73-10951) (Jones-Wisconsin)
W73-10958

AQUATIC PLANT CONTROL RESEARCH PROJECT PLAN FY 73-77 (PPB REPORT),
Corps of Engineers, Washington, D.C.
E. O. Gangstad.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, Appendix p B3-B12, 1972.

Descriptors: *Aquatic weed control, *Project planning, *Project purposes, *Project benefits, *Inland waterways, Eutrophication, Aquatic plants, Planning, Control, Rivers and Harbors Act, Conservation, Legislation, Environment, Research and development, Herbicides, Harvesting, Mechanical equipment, Insects, Forage fish, Estimated costs, Plant diseases.
Identifiers: Eradication, Laser, Plant utilization, Plant pathogens.

The Army Corps of Engineers' project titled 'Integrated Mechanical, Chemical, and Biological Control Systems for Aquatic Plants' is described fully. Under 'Problem Requiring Research' are listed obnoxious plants in coastal and inland waterways, statement of the problem, present procedures and possible improvement. Under 'Impacts' are listed an impact matrix, research and plan schedule, surveys, sequence of tasks, work accomplished by others, controlled-release herbicides, control by laser, plant utilization, mechanical harvest, aquatic plant insects, aquatic plant pathogens, herbivorous fish, execution capability, and resources required. Under 'Estimated Magnitude of Payoff' various control methods are described, cost estimates and man-years are presented for 1973-1977, significant dates in project scheduling, progress and accomplishments through 1972, and alternative funding schedules. INTEGRATION OF BIOLOGICAL AND CHEMICAL CONTROL OF ALLIGATOR WEED,
Agriculture Research Center, Fort Lauderdale, Fla.
R. D. Blackburn, and W. C. Durden.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, Appendix p C3-C17, 1972. 2 fig, 3 tab.

Descriptors: *Biocontrol, *Integrated control measures, *Alligatorweed, *Aquatic weed control, Herbicides, Plant growth, Insects, Georgia, 2-4-D, Diquat, Florida, Laboratory tests, Chemcontrol, Rates of application.
Identifiers: Agasicles, Savannah (Ga), Jacksonville (Fla).

It has been demonstrated that the alligator weed flea beetle (Agasicles sp.) can severely damage the surface stems of floating alligator weed mats but it alone cannot completely control floating mats because it cannot feed on the submerged stems. Constant pressure must be applied on the surface vegetation to prevent carbohydrate buildup in subsurface stems. Field observations indicated low rates of herbicides, used in combination with beetles, can result in more severe and longer lasting damage to floating alligator weed mats than is attainable with either agent alone. Growth pool and field experiments were initiated to determine if there was a preference by the flea beetle for alligator weed treated with herbicides, and the effectiveness of the beetle on alligator weed with and without herbicidal treatment. Application of herbicides, followed by introduction of beetles in the fall, resulted in reduction of surface alligator weed in drainage ditches. Spring application of herbicides suppressed alligator weeds for approximately four weeks. The ideal method of controlling alligator weed in late summer or early fall would be by treatment with a light herbicide application, insect damage on regrowth, and frost killing of regrowth. AQUATIC PLANT PROBLEMS IN LOUISIANA,
Army Engineer District, New Orleans, La.
W. E. Thompson.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, Appendix p D3-D10, 1972.

Descriptors: *Water hyacinth, *Alligatorweed, *Louisiana, Aquatic weeds, Dispersion, Distribution.

The introduction of water hyacinth and alligator weed into the United States and a general description of the plants, their growth habits, and propagation are given. By 1898 practically all of the main bayous in southern Louisiana were badly infested, some bayous becoming completely blocked making rivers and streams unsafe for navigation, a hazard to fish, public health, and drainage. To the present, the area and infestation intensity have steadily increased. Only a small percentage of water hyacinths are killed by frost in southern latitudes and indications are that the plant is becoming acclimated in its creep northward. The water hyacinth is normally quickly affected by salt water, however there are some evidence that it is becoming accustomed to moderate salinity and plants grow fairly well in brackish waters. The alligator weed has spread from the bayous up into ditches and thence into cultivated lands. Farm machinery, suction dredges, and floods have aided in its dispersal. Any degree of water hyacinth infestation must be considered a hazard due to its limitless deposition of seeds and their long viability; any area once infested must be regarded as infested for a long period after the last plant has been removed. MECHANICAL HARVESTING OF WATER HYACINTH IN SHELL CREEK RESERVOIR, CHARLOTTE COUNTY, FLORIDA,
Florida State Game Freshwater Fish Commission, Eustis.
J. M. VanDyke.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, Appendix p E5-E28, 1972. 3 fig, 12 tab, 11 ref.

Descriptors: *Aquatic weed control, *Mechanical equipment, *Harvesting, *Prototypes, *Water hyacinth, Reservoirs, Florida, Costs, Construction costs, Operating costs, Maintenance costs, Manpower, Operations.
Identifiers: Shell Creek Reservoir (Fla.), Sarasota Weed and Feed, Inc.

Water hyacinth's fecundity and ability to form mats and damage water quality make it the most economically and ecologically destructive aquatic weed in Florida. The study site for the prototype harvester was Shell Creek Reservoir, the municipal water supply for Punta Gorda, Florida. To reduce chemical control programs, a study was

made for removal of hyacinths by a mechanical method and development of an effective and economically feasible harvester. The harvester studied, constructed by Sarasota Weed and Feed, Inc., is a stationary, land-based system designed to remove floating aquatic vegetation, specifically water hyacinth. Chemical data on the reservoir show that mechanical harvesting had little or no effect on the water quality. With improvements, the harvester's output should be greatly increased. With its log, cattails, and heavy hyacinths, Shell Creek Reservoir was a tough testing ground. All of the hyacinths were chopped, a costly and time-consuming operation. The project was manned and equipped to find the limits of the harvester, not to achieve a low cost per ton or cost per acre figure. (See also W73-10951) (Jones-Wisconsin)

EVALUATION OF AQUAMARINE CORPORATION MECHANICAL HARVESTER IN REMOVAL OF WATER HYACINTHS, ST. JOHNS RIVER, BLUFTON, FLA.,
Florida State Game Freshwater Fish Commission, Eustis.
L. J. Touzeau.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, Appendix p E31-E37, 1972.

Descriptors: *Aquatic weed control, *Mechanical equipment, *Evaluation, Cost analysis, On-site tests, Water hyacinth, Harvesting.
Identifiers: St. Johns River (Fla,), Blufton (Fla.), Aquamarine Corp.

A mobile water hyacinth harvesting machine, designed and built by the Aquamarine Corporation of Waukesha, Wisconsin, was evaluated during its test operation at St. Johns River, Blufton, Florida. The harvester was anchored to the shore for fixed site operation and utilized an airboat to push hyacinths to the machine. The specific equipment used and potential improvements to be made are listed. The relative truck operation time estimate gives 80% as time spent hauling the weeds to the disposal site and 20% operation time spent in loading. 66% of the harvester time was not utilized due to difficulty in feeding the hyacinths to the harvester. Minimum tonnage removed averaged 20 tons per hour. Estimates of cost breakdowns for the test evaluation, operation of the machine, and supplemental equipment are included. SALINE AND ORGANIC WATER POLLUTION,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
H. L. Bohn, and G. V. Johnson.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 209-220, 1972. 11 ref.

Descriptors: *Water pollution, *Saline water, *Organic matter, *Water utilization, *Recycling, Freshwater, Recharge, Oceans, Reclamation, Desalination, Food abundance, Water supply, Nutrients, Wastes, Soils, Plants, Treatment.

Better use and recycling of fresh water, which often recharges the oceans, would reduce man's disruption of nature to increase his supply of potable water. The global distribution of water, desalination, water reclamation and recycling, the roles of soils and plants in recycling and urban misuse of water are discussed. Man can increase his supply of food and good fresh water by recycling and nutrient balance, which imply living off his wastes. Intimate involvement of soils and plants in the production of fresh water and food is clear. Soils and plants should be equally involved in converting our waste water into potable water and useful nutrients. Numerous examples of how this may be done and how it is being done are presented. COLLECTIVE UTILITY OF EXCHANGING TREATED SEWAGE EFFLUENT FOR IRRIGATION AND MINING WATER,
Arizona Univ., Tucson. Dept. of Systems and Industrial Engineering.
S. C. Ko, and L. Duckstein.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 221-234, (1972). 11 ref. OWRR A-022-ARIZ (4).

Descriptors: *Sewage effluents, *Irrigation water, *Industrial water, *Groundwater mining, *Alternative planning, Water utilization, Social aspects, Economic impact, Groundwater resources, Wastes, Arizona, Economic efficiency, Model studies.

The concept of collective utility is applied to a case study of alternative water resource utilization by providing a basis for comparing alternative uses of resources from the viewpoint of aggregate welfare. The exchange of sewage effluent for groundwater used by irrigation farmers, and the exchange of sewage effluent for groundwater used by processing and milling miners in Tucson, Arizona, are given as examples. Reviewed are collective utility concepts, case problems, definitions of problems, formulation of the model, and marginal change of collective utility. The first case has a collective utility of $800,500-G, where G represents unquantifiable factors, such as the reduction in quality of living due to the odor if solid waste exchanges. The second case has a collective utility of $175,000. Since it is likely that G will be on the order of $1 million per year, the first exchange is preferable to the second. TOWN OF CAIRO WATER SUPPLY REPORT.
Diachishn (A.) and Associates.

Available from the National Technical Information Service as PB-214 025, $3.75 in paper copy, $0.95 in microfiche. Prepared for Greene County Planning Department, Cairo, New York, August, 1972. Report No GCPD 3-lb. 30 p, 4 fig, 4 tab. HUD Grant N. Y. P. 246.

Descriptors: *Planning, *Water supply, Water demand, Land use, Water sources, *New York, *Water districts, *Comprehensive planning, *Cities.
Identifiers: *Cairo (New York), Water supply system improvements.

A general planning study for future water supply for the Town of Cairo in New York State is presented. This report and a companion wastewater collection and disposal study are integral parts of the town's comprehensive plan. It is felt that water supply and sewerage systems are very important not only for the growth of the town but also to control the location and density of urban land use. The report covers the expected population growth in the area, future water supply demands up to the year 2020, potential sources of water supply, i.e. groundwater and small impoundments, the existing water supply system, and a master plan for additions and improvements to this system. It is recommended that a water district be established and that it purchase the existing water supply system and implement the master plan. (Elfers-North Carolina)

In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area, Massachusetts Water Resources Research Center, Publication No. 25, 1973, Appendix A, 55 p. OWRR C-2169 (No. 3377) (1).

UNIV. OF ILL. URBANA CHAMPAIGN

Descriptors: *Diversion, *Attitudes, *Decision making, *Social impact, *Political aspects, *Connecticut River, *Massachusetts, Planning, Water supply, Pumped storage, Flood flow, Environmental effects, Riparian rights, Multiple-purpose reservoir, Nuclear powerplants, Local government, Institutions, Inter-basin transfers.
Identifiers: *Boston, Springfield (Mass.), Quabbin Reservoir, Northfield Mountain, Swift River, Chicopee River, Minimum flow, Public protest.

Response of Connecticut River valley citizens and officials to the proposed diversion of Connecticut River flood waters into Quabbin Reservoir is described. Opposition, while apparently broadly-based, was in fact attributable to a small constituency of activists. Opponents of diversion were more knowledgeable, better educated, younger, and more highly motivated than proponents. Opposition centered in the Springfield area, but was not evident further downstream in the state of Connecticut. Opponents were generally mistrustful of government, and those declaring themselves neutral tended in fact to be opposed. While officials favored diversion more than citizens, elected officials were disproportionately neutral. Political party affiliation had no bearing on this issue. Occupation was the most clearcut, apparent determinant of one's position. Reasons for opposition were most frequently related to the precedent set for future diversions of larger scope, alleged harmful environmental consequences, and failure of the Metropolitan District Commission to seek other alternatives. Opposition to the diversion proposal was effective in delaying its official approval but not in changing the proposal itself in any significant particular. Effectiveness of opposition might have been greater had opponents taken a more low-toned, factual approach giving more credence to the rational points made by the proposal's supporters. POTENTIALS FOR A DELAWARE DEEPWATER PORT.
Gladstone Associates, Washington, D.C.

Prepared for the Delaware State Planning Office, Dover, October, 1970. 129 p, 23 fig, 38 tab, 44 ref, 4 append.

Descriptors: *Economic feasibility, *Marketing, Environmental effects, Shorelines, *Delaware, *Water uses.
Identifiers: *Deepwater port, *Delaware Bay, Shoreland development.

This analysis of market potentials for a deepwater port (to handle supertankers) in the lower Delaware Bay is predominantly economically oriented and thus does not cover factors such as environmental impacts, design criteria, and state regulatory policy. The emphasis is on which industries and/or economic goods would take advantage of the deepwater port. Petroleum and iron ore are seen to have a high potential use of the port facility while coal, grain, and forest products would have low potentials. Some of the conclusions include: (1) probably only one deepwater port will be built on the East Coast in the 1970's; (2) the Delaware Bay is as advantageous a site as any on the East Coast; (3) on-shore development is not necessary for the operation of the port but petroleum and iron ore related industries are likely to be attracted; (4) private sector savings from the use of such a port should be substantial; and (5) public sector costs and benefits must be calculated also to determine the desirability of the port and the specific location. CONSTRAINTS IN WATER MANAGEMENT ON AGRICULTURAL LANDS,
Colorado State Univ., Fort Collins. Dept. of Economics.
G. E. Radosevich, E. C. Vlachos, and G. V. Skogerboe.
Water Resources Bulletin, Vol 9, No 2, p 352-359, April 1973.

Descriptors: *Water management (Applied), *Irrigation, *Administration, *Social aspects, *Water law, *Water policy, Irrigation practices, Irrigation districts, Social values, Return flow, Water rights, Water quality control, Constraints.

Whether the goal is minimizing water quality degradation in receiving streams or maximizing agricultural production on existing croplands, the solutions are identical--improved water management practices. Technology has succeeded in developing feasible solutions to improvement of irrigation water management, but the law has been slow to direct or encourage implementation. The culprit of the western United States water problem is the property right concept of the appropriation doctrine. The most substantial impact in solving the legal and other institutional constraints inherent in the appropriation doctrine would be more stringent application of the beneficial use concept. Moreover, water quality should be made a part of each water right, the appurtenancy concept, which ties water to land, should be eliminated, and water laws should be modified to encourage the renting, leasing, transferring or selling of water rights to other uses and places so long as the vested rights of others are protected. Improving water management also implies organizational improvements such as increasing project irrigation efficiency and effectiveness through consolidation of fragmented irrigation and drainage districts into valley-wide single management units. All attempts for modifying water use must be guided by a pervasive spirit of social consciousness. (Bell-Cornell)

RICE GROWING IN DEEP WATER IN MALI,
J. M. Bidaux.
Agron Trop Ser Riz Rizic Cult Vivrieres Trop. Vol 26, No 10, p 1100-1114, 1971. Illus. English summary.
Identifiers: Drought, Fertilizers, Insect, *Mali, Pests, *Rice growing, Weeds.

High rice-fields where flooding does not exceed 1 m and low rice-fields where it ranges from 1 m to 3 m are distinguished. The rate of water rise can be higher than 10 cm/day at the beginning of flooding, it is about 3 cm/day towards the end of the rising period. Farmers sow in July after one or more plowings from March-April and rice is grown as rainfed rice till the flood occurs. The limiting factors of this rice-growing method are: drought, weeds, insect pests, inadequate fertilizers and late harvests.--Copyright 1973, Biological Abstracts, Inc.

AGROMETEOROLOGICAL INDICATORS OF THE MAIZE DEVELOPMENT IN THE REPRODUCTION PERIOD, (IN BULGARIAN),
Maize Research Inst., Knezha (Bulgaria).
N. Slavov.
Rasteniev''d Nauki. Vol 9, No 1, p 3-11, 1972. Illus. English summary.
Identifiers: Equations, Indicators (Agrometeorological), *Maize, Soil moisture, *Reproduction, Air temperature, *Air moisture.

A direct relationship exists between the length of the tasseling--silking initiation and air temperature and an inverse relationship between this period and soil moisture. An inverse relationship was observed between the length of the silking initiation--milking subperiod and air temperature. The length of the milking--dough maturity subperiod was closely related to the effective temperature. The length of the dough--full ripeness subperiod depends on the mean daily deficits of air moisture. Equations are presented for these relationships.--Copyright 1973, Biological Abstracts, Inc.
W73-10635

ON THE WATER CONSUMPTION OF WHEAT GROWN IN THE REGION OF PAZARDJIK IRRIGATION SYSTEM, (IN BULGARIAN),
Institute of Water Engineering and Land Improvement, Sofia (Bulgaria).
Y. Delibaltov.
Rastenievd Nauki, Vol 9, No 3, p 47-63, 1972. Illus. English summary.
Identifiers: *Bulgaria (Pazardjik), Fertilizers, Growth, Irrigation, *Wheat, Yield, Water requirements (Plants).

The water consumption of 'San Pastore' winter wheat grown on Bulgarian cinnamonic forest soils was determined. The field experimentation consisted of the following variants: no irrigation; pre-, or post-seeding irrigation; pre-, or post-seeding and irrigation to maintain the soil moisture during the sowing-jointing, jointing-milk stage and milk stage-harvest subperiods at 70% of the field moisture capacity (fmc) respectively; pre-, or post-seeding and irrigations for maintaining soil moisture of 70-80-70% of fmc during the respective subperiods, given in the third variant, and irrigation merely during the cropgrowing season for maintenance of the same soil moisture in the respective subperiods as in the fourth variant. The water requirements of wheat at maintenance of soil moisture of 70-80-70% of fmc varied between 4100 and 5660 cu m/ha for the 8-yr period 1962-1969. The water consumption for the jointing-heading and heading-milk stage subperiods accounted for 24 and 21.5% respectively of the consumptive use of water for the entire growing season. The daily use-rate varied widely by variants, years and periods. It is the highest during heading and milk stages reaching a peak of 52.3 cu m/ha. The maximum daily use-rate of irrigated wheat occurs 10 to 15 days later compared to unirrigated wheat. There is a close correlation between the water use for 100 kg grain produced and yield. The water consumption at different levels of fertilizing is not in a linear dependence on yield. At fertilizer levels over N100P80K60, water consumption decreases and yield increases.--Copyright 1973, Biological Abstracts, Inc.
W73-10636

THE EFFECT OF PLOWING UNDER CORN STRAW ON SOME SOIL PROPERTIES AND THE YIELD OF CORN UNDER CONDITIONS OF DRY FARMING AND IRRIGATION, (IN SERBO-CROATRAN),
Corn Inst., Belgrade (Yugoslavia).
R. Jovanovic, P. Maksimovic, and I. Franic.
Arh Poljopr Nauke. Vol 25, No 89, p 39-48, 1972. Illus. English summary.
Identifiers: Air, Compaction, *Corn, *Dry farming, Irrigation, *Plowing, Soils, Straw (Corn), Yield.

Two factorial trials were set up according to the split-plot scheme in the following combinations: (a) corn straw removed, (b) corn straw plowed under. The 4 line hybrid 'Zemun Polje 755' was used. Plowing was done in Oct. to a depth of 30 cm. Soil samples were taken directly after the autumn plowing, in the spring during the first 10 days of April and after harvesting the corn during the second half of Oct. After 3 yr the soil in which corn straw was plowed under had a compactness of 0.060 g/cm3 during the first, 0.087 g/cm3 during the second, and 0.060 g/cm3 during the third measurement. The soil from which the corn straw had been removed between the first and second measurement had a 0.13 g/cm3 increase in compactness. With irrigation the difference in soil compactness in 1966-1967 was 0.06 g/cm3 between the first and second measurement and 0.18 g/cm3 between the first and third measurement. In 1968 the difference in soil compactness was 0.08 g/cm3 between the first and second and 0.19 g/cm3 between the first and third measurement. With dry farming, the combination in which the corn straw was plowed under had a 0.453 volume% air capacity increase during the first, a 0.470 volume% increase during the second and 0.364 volume% increase during the third measurement. Under conditions of irrigation and due to plowing under the corn straw, a higher yield of corn was obtained. Under conditions of dry farming and due to the effect of plowing under the corn straw, a higher yield of kernel was also obtained.--Copyright 1973, Biological Abstracts, Inc.

WATER INFILTRATION UNDER CENTER--PIVOTS,
Colorado State Univ., Fort Collins. Dept. of Agricultural Engineering.
J. W. Addink.
Ph. D. Dissertation, August 1972. 145 p, 36 fig, 18 tab, 53 ref. OWRR-B-039-COLO (6).

Descriptors: *Sprinkler irrigation, *Irrigation systems, *Agricultural runoff, *Rate of application, Water conservation, *Soil moisture, Pipelines, Laboratory tests, Numerical analysis, Model studies, Equations, Darcy's law, Continuity equation, *Infiltration rates, Hysteresis, Flow, Shrinkage.
Identifiers: *Center-pivots.

Because of their labor-saving advantage and ability to irrigate rolling terrain and light soils, center-pivot sprinkler systems are popular. Consisting of water pipelines suspended in the air by cables or trusses and self-propelled towers, the system slowly revolves in a circle while distributing the water by sprinklers connected above the pipelines. The literature is examined at length, then the experimental design and procedures employed in the laboratory are described. Equipment included soil separation compartments, soil drying equipment, spray bar, runoff collection containers, and tensionmeters connected to manometers to monitor soil moisture tension. The numerical simulation model provided a solution to moisture flow equations derived from Darcy's Law and continutiy, and was extended to predict conditionsbeyond those of the laboratory infiltration tests. Further extensions to calculate possible effects of shrinking and swelling are also suggested. Main conclusions drawn are that a numerical moisture-flow model can be a helpful research tool, and that nonsymmetrical application rate patterns have potential for reducing runoff 10 percent or more under center-pivot sprinkler systems. (Popkin-Arizona)

A BUDGETING AND LINEAR PROGRAMMING ANALYSIS OF IRRIGATION WATER VALUES IN NORTHERN WYOMING,
Wyoming Univ., Laramie. Dept. of Agricultural Economics.
T. L. Dobbs, and J. R. Owen.
Wyoming Water Resources Research Institute, Completion report, November 1972. 88 p, 9 fig, 22 tab, 40 ref. OWRR-A-001-WYO (59).

Descriptors: *Linear programming, *Irrigation water, Water balance, *Budgeting, *Wyoming, Water management (Applied), Agriculture, *Water utilization, Alfalfa, Grasses, Hay, Pastures, Model studies, Value, Water rights, Limiting factors, Hydrologic data, Water demand, Water conservation.

Wyoming became formally involved in water planning with the State Water Plan of 1967. This study provides information relating to agricultural water uses which should aid in the water planning. Irrigation water values for major drainages are estimated, and current patterns of agricultural water use are described for the study area in Wyoming. Budgeting analysis is used to estimate irrigation water which increased flood-irrigated alfalfa, grass hay and pasture. Linear programming analyses generated three solutions for two ranch models in each basin of the study area. The annual values of assumed water rights are claculated by the analysis. Estimated annual values of assumed water rights ranged from $7.76 down to $2.93 per acre foot for the two model ranches. Irrigation water was generally found to be most limiting in July. More reliance can be placed in the so-called crops-only model than in the crops-and-livestock model, because of the greater emphasis placed on collection of crop data. Regional research for Wyoming water planning relating to irrigation and industrial water demands is suggested. The assumptions of linear programming analysis are reviewed. (Popkin-Arizona)
W73-10699

AN ECONOMIC ANALYSIS OF CENTER--PIVOT SPRINKLER IRRIGATION SYSTEMS IN SOUTHEASTERN WYOMING, WITH EMPHASIS ON FINANCING ALTERNATIVES,
Wyoming Univ., Laramie. Dept. of Agricultural Economics.
T. L. Dobbs, and W. G. Wedemeyer.
Wyoming Water Resources Research Institute, Completion report, Oct. 1972. 42 p, 1 fig, 19 tab, 22 ref. OWRR-A-002-WYO (2).

Descriptors: *Economic impact, *Sprinkler irrigation, *Wyoming, *Financing, *Irrigated land, Loans, Interest rates, *Economic feasibility, Costs, Return flow, Data collections, Investment, Crop production, Potatoes, Sugar beets, Profit, Land use, Alfalfa, Corn (Field), Rotations, Risks, Sampling, Forages.
Identifiers: *Center-pivots, Cash crops.

Wyoming has experienced a rapid expansion in acreage irrigated by center-pivot sprinkler systems as a result of state supported low-interest loans. This study determines alternative sources of financing and assesses the economic feasibility of center-pivot sprinkler systems. Cost and return flows were estimated, and financial and economic data were analyzed. More than one-half of the center-pivots in use by 1971 were financed by a low-interest state loan plan. Investments in sprinkler systems for production of cash crops (potatoes, sugarbeets) can be highly profitable, and do not depend on low-interest financing for economic viability. Only under conditions of low-interest financing and relatively low-value alternative uses for land do investments in sprinklers strictly for alfalfa production become economically attractive. Profitability of sprinkler investments in corn-alfalfa rotations is influenced considerably by corn silage values and by financing utilized. Investments in sprinklers for production of forage crops are economically feasible only under particular sets of assumptions. Uncertainty issues of sampling size bias are noted. (Popkin-Arizona)

Descriptors: *Root development, *Crop production, *Wheat, *Soil water, *Plant growth regulators, Crop response, Soil-water-plant relationships, Droughts, Hydraulic properties, Root systems, Grains (Crops), Harvesting, Cultivation, Weight, Water supply.

It is common for wheat crops to rely heavily on stored water in drought-prone environments. Pot experiments are described which test the thesis that increasing the hydraulic resistance of the root system will increase grain yield of wheat growing entirely on stored water. One experiment measured only water use and final grain yield. The main experiment included the observation of the performance of the plant through time. Pots were weighed every week, and periodic harvests were made after sowing. Root weights were also estimated. Restricting the root system to one seminal root decreased the rate of water use during the first few weeks of growth. The larger yield of single-rooted plants was due to the larger amount of water available during the last few weeks of growth. When Gabo wheat is growing on limited stored water, the grain yield can be greatly increased by forcing the plants to rely solely on one seminal root. The single-root plants use less water before anthesis than do normal plants because they have a much larger resistance to vertical flow through the root system. The xylem of the seminal root is dominated by one large vessel whose diameter probably determines the hydraulic resistance. It is possible to breed high root resistance into existing cultivars by breeding for smaller vessels. (Popkin-Arizona)

SURVIVAL OF MAIZE BACTERIAL STALK ROT PATHOGENS IN INFECTED TISSUE UNDER DIFFERENT MOISTURE AND TEMPERATURE CONDITIONS,
Udaipur Univ. (India). Agricultural Experiment Station.
T. B. Anilkumar, and B. P. Chakravarti.
Indian Phytopathol. Vol 24, No 3, p 567-570. 1971.
Identifiers: *Bacterial stalk rot, Erwinia-carotovora, *Maize, Moisture, *Pathogens, Pseudomonas-Lapsa, Temperature.

Erwinia carotovora survived for 24, 15 and 12 wk at 10C, 20C and 30C, whereas Pseudomonas lapsa survived for 30, 18 and 18 wk respectively, under similar conditions. E. carotovora survived for 18 wk at 98% humidity (RH), 15 wk at 95% RH and 12 wk at 90% and 81% RH, while P lapsa survived for 24, 18, 15 and 18 wk respectively at these relative humidities. In infected maize stalk collected from the field, E. carotovora survived 27-36 wk and P lapsa survived 40-43 wk depending on the nature of the plant tissue infected. Survival was higher in the root portion than in the aboveground portion.--Copyright 1973, Biological Abstracts, Inc.

Identifiers: *Fertilizers (Chemical), Irrigation, Morphological studies, Physiological studies, *Wheat, Yields.

'Bezostaia 1' was studied under irrigation conditions on 3 soils fertilized with P (PO, P40, P80) to which 5 increasing N rates (NO, N40, N80, N120, N160) were applied at winter plowing. Studies were then carried out using 'F 38/64,' 'F 49/64,' 'F 77/64,' 'F 246/65' and 'F 360/64' lines, and 'Bezostaia 1' and 'Capitole' planted on 3 previously differently fertilized soils (N100P50, N150P50 and N200P50). In 'Bezostaia 1' the N160P40, N80P80, N120P80 and N160P80 treatments as well as in 'F 360/64,' 'F 49/64,' 'F 246/65' fertilized with N200P50 and N150P50, proved remarkable in growth and development rate, a smaller necrosis percentage and a high metabolic activity during the whole plant vegetation period which led to a higher accumulation of nutrients and outstanding yields.--Copyright 1973, Biological Abstracts, Inc.

OVERHEAD IRRIGATION OF SUGAR BEET ON SILTY LOAM: THE EFFECT OF SPRINKLING AND N-MANURING ON YIELDS AND ESSENTIAL QUALITY FACTORS, (IN GERMAN),
Hohenheim Univ., Stuttgart-Hohenheim (West Germany).
K. H. Martin, and A. Kachani.
Z Acker Pflanzenbau. Vol 134, No 1, p 1-24. 1971. Illus. English summary.
Identifiers: Ash, Growth, Irrigation, Leaf, *Loam soils, Manure, Nitrogen, Roots, Silty loam, Sprinkling, *Sugar beets, Yields.

The yield of sugar beet roots with overhead irrigation at 75% of available capacity, showed only a small increase in a wet year, whereas in a year when there were a number of dry periods, increases in yield were obtained up to a maximum of 13.3%. Increased N-manuring only resulted in an increase in only 1 yr. Leaf growth showed an increase both with overhead irrigation and increased N-manuring. Sugar content showed almost no response to irrigation in the wet year but in the dry year there was an increasingly marked fall after each successive irrigation. The fall in the final sugar content at harvesting was relatively small in those cases where no irrigation was given during the last 4 wk. In all cases, increased N-manuring resulted in a decrease in sugar content. The soluble ash content was higher after every irrigation. This tendency to a higher soluble ash content was further strengthened by supplementary N-manuring. Harmful N content in 1968 was reduced in all cases, but in the dry year this reduction was only obtained under intensive irrigation, while increased N-manuring had a reverse effect. The 'corrected' sugar yield showed an improvement in both years as a result of irrigation. Compared with the non-irrigated control, however, the difference was not statistically significant.--Copyright 1973, Biological Abstracts, Inc.

BACTERIAL BLIGHT OF CARROT IN WISCONSIN,
Wisconsin Univ., Madison.
S. M. Saad, and E. K. Wade.
Plant Dis Rep. Vol 56, No 9, p 744-746. 1972. Illus.
Identifiers: Bacterial studies, *Blight, *Carrot, Davcus-Carota, Electron microscopy, Humidity, Relative humidity, Tests, *Wisconsin, Xanthomonas-Carotae.

Bacterial blight of carrot caused by Xanthomonas carotae was found for the first time in Wisconsin during the summer of 1971. The disease was observed on the leaves, stems, and petioles of carrots (Daucus carota), cv. 'Spartan Sweet,' grown on a muck farm in Jefferson County. The Nantes cultivar showed only a trace of infection. A high level of relative humidity (RH) of 90-100% for 48-72 hr after inoculation is necessary for the bacteria to cause infection. Typical disease symptoms appeared on the foliage within 12-15 days with severe infection developing at the end of 20 days. Electron microscope study, the Hugh-Leifson test, and other tests indicated that the bacterium was Xanthomonas.--Copyright 1973, Biological Abstracts, Inc.

EFFECT OF CLIMATIC FACTORS ON ALPHA, BETA, GAMMA CAROTENE AND XANTHOPHYLL CONTENT IN CORN DOUBLE HYBRIDS, (IN RUMANIAN),
Institutul de Cercetari Pentru Cereale si Plante Tehnice, Fundulea (Rumania).
O. Munteanu.
An Inst Cercet Pentru Cereale Plante Teh Fundulea Ser C Amelior Genet Fiziol Tehnol Agric. 37 p, 147-154. 1969 (1971). English summary.
Identifiers: *Carotene, Climatic factors, *Corn hybrids (Double), Light, Temperature, *Xanthophyll.

Two hundred and fifty samples of corn kernels were analyzed in 3 corn double hybrids (HD 98, HD 99 and HD 120) with a shorter growth time, grown at 9 experiment stations and in 3 hybrids (HD 261, HD 310 and HD 311) with a longer growth time. Carotenoid accumulation is to a great extent conditioned by temperature and moisture in June-July-Aug., as well as by light in June. An 18-20C temperature and balanced rainfall favors carotenoid accumulation. A temperature of over 21C and reduced rainfall hinder carotenoid accumulation. Carotenoid synthesis is promoted by intensive light in June. Xanthophyll content is stimulated by abundant rainfall in Aug.--Copyright 1973, Biological Abstracts, Inc.

IRRIGABILITY CLASSIFICATION OF SOILS, (IRRIGABLE SOILS OF NEVADA).

Nevada Division of Water Resources Map S-15, 1973. 1 map, 3 tab, 2 ref.

Descriptors: *Irrigable land, *Agriculture, *Soil classification, *Nevada, Soil properties, Crops, Soil mechanics, Irrigation, Land management, Temperature, *Maps, Soil-water-plant relationships, Evaluation.

This classification which includes tables and a multicolor map, is a rating system which indicates the potential usefulness of different kinds of soil for irrigated agriculture in Nevada. It is based on both judgements of the feasibility of initial improvements such as drainage, removing stones, leveling, ripping hardpan, or removing soluble salts and alkali, and on continuing limitations for use requiring special management, such as control of salt buildup. It does not consider the present availability or lack of irrigation water. The classification is intended for general planning, rather than for location of specific fields for agriculture or for identification of specific management needs. But, it does indicate major limitations for initial improvement and major hazards to continued use. Five major classes of potential usefulness for irrigation are divided into subclasses to indicate the nature of the most outstanding use limitations. Since length of growing season is so important in determining the kinds of crops which might be grown and their economic value, the irrigability classes are subdivided again according to the freeze-free (32 deg F) season zone in which the various soils occur. DRAINAGE COEFFICIENT FOR SURFACE DRAINAGE OF AGRICULTURAL LAND FOR DIFFERENT PARTS OF THE COUNTRY,
Soil Conservation Research, Demonstration and Training Center, Dehra Dunn (India).
S. K. Gupta, K. G. Tejwani, and R. Babu.
Irrigation and Power (India), Vol 28, No 1, p 53-60, January 1971. 8 fig, 1 tab, 6 ref.

Descriptors: *Drainage systems, *Irrigation, *Agricultural engineering, Design criteria, Methodology, Crops, Soil types, Rainfall intensity, Land use, Forecasting, Correlation analysis, Furrow drainage, Contour farming, Terracing, Land management, Foreign countries.
Identifiers: *India.

Surface drainage has great scope in India, especially in black soils and irrigated areas. Regional standards for design of the drainage systems need to be prepared for the use of field staff. For surface drainage, the main requirement is a suitable outlet. The outlet design is dependent on the 'drainage coefficient' which denotes the depth of water to be removed per day. The method of estimation involves consideration of the crops to be grown, soil cover complex numbers, rainfall intensity, and conversion of this rainfall to the runoff depth. Surface drainage from agricultural lands can be broadly grouped into three categories according to the sensitivity of crops to waterlogging, e.g., vegetables, grains, and rice require that excessive water may be drained within 6, 24, and 72 hours respectivity, so that no damage is caused to the crops by waterlogging. (Woodard-USGS)

04. WATER QUANTITY MANAGEMENT AND CONTROL

4A. Control of Water on the Surface

INVESTIGATION OF NATURAL SEALING EFFECTS IN IRRIGATION CANALS,
Idaho Univ., Moscow. Dept. of Civil Engineering.
C. E. Brockway.
Available from the National Technical Information Service as PB-221 010, $3.75 in paper copy, $0.95 in microfiche. Idaho Water Resources Research Institute Completion Report, May 1973. 35 p, 10 fig, 1 tab, 65 ref. OWRR A-023-IDA (1). 14-01-001-3212.

Descriptors: *Canal seepage, Tensionmeters, *Idaho, *Seepage, Seepage control, *Hydraulic conductivity, Clays, *Irrigation canals, Loam, Soil moisture, Irrigation water, Microbial degradation.
Identifiers: Clay swelling.

Results of a three year study on the factors contributing to natural sealing of irrigation canals and reservoirs are presented. Laboratory evaluations of the effect of sedimentation, microbiological activity and soil-water chemical reactions on the hydraulic conductivity of soils were performed. Particular emphasis was on the Portneuf silt-loam soil of southern Idaho. Techniques for determining and predicting the sediment entrapment in soils from hydraulic conductivity measurements in laboratory columns are presented. Application of a method utilizing soil clay content, exchangeable sodium percentage, and total salt concentration of irrigation water to predict hydraulic conductivity is evaluated. The effect of microbiological activity in the benthic area of canals and reservoirs on seepage rates is discussed. Field tests in an operating canal to monitor soil moisture tension, soil moisture and seepage rates during an irrigation season are outlined. Long term reduction in seepage rates of canals constructed in silt-loam soils is due to the formation of an impeding layer on the canal bottom due primarily to sedimentation. Seasonal changes are predominantly affected by microbiological activity in the impeding layer.

GEOHYDROLOGIC RECONNAISSANCE AND STUDY PLAN FOR WATER RESOURCES INVESTIGATIONS IN THE BARODA-BROACH AREA, GUJARAT, INDIA,
Geological Survey, Washington, D.C.
P. R. Seaber.
Geological Survey open-file report, June 1972. 65 p, 10 fig, 3 tab, 8 ref.

Descriptors: *Water resources, *Hydrology, *Surface waters, *Groundwater, *Water quality, Foreign countries, Geology, Climate, Soil types, Water utilization, Irrigation, Cotton, Water supply, Streamflow, Ponds, Water wells, Groundwater recharge, Chemical analysis, Well data, Water levels, Aquifers, Rainfall, Artificial recharge, Saline water intrusion.
Identifiers: *India, Baroda-Broach area (India), Gujarat (India).

The water resources of the Baroda-Broach area, Gujarat, India, are not fully utilized at present (1972). The surface-water resources of the Narmada River basin are largely unused, but could be utilized if the proposed dam near Rajpipla is built. The average annual flow of the Narmada near Rajpipla is 38.2 billion cubic meters, and the proposed dam has a contemplated storage of 17.3 billion cubic meters. The Tapti River is tapped for 10,000 cubic meters of water per day for use in water flooding of oil-bearing formations. The present system of domestic supply from village ponds utilizes surface storage of monsoon runoff directly and indirectly in the dry season (April-June) by artificial recharge and withdrawal through dug wells. The Baroda-Broach area is underlain almost everywhere by black cotton soil derived from weathering of the Deccan trap. Cotton is the main crop. Groundwater withdrawal mainly occurs from village wells and some irrigation wells, 10 to 90 meters deep. The Gujarat Alluvium of Holocene age contains the principal groundwater system. The groundwater is fresher toward the inland hilly periphery and more saline toward the coast. The dissolved solids content of water in the Gujarat Alluvium ranges from approximately 127 to 15,600 mg/liter. (Woodard-USGS)

Identifiers: Annual index flows, Historic data, Conejos River, Los Pinos River, San Antonio River.

There has been considerable controversy over the distribution of the Rio Grande River water among the Upper basin states of Colorado, New Mexico, and Texas. These states formed a joint commission in 1923 to study the problem. In 1939 a compact was ratified which provided for information exchange among these states and the establishment of gaging stations on and maintenance of the existing water supply levels of the Rio Grande. By 1968, Colorado had accrued a large debit, and so the Rio Grande Compact (1970) requires the state to deliver water to New Mexico at the State line on a yearly basis. The annual index flow for the Rio Grande and Conejos Rivers must be determined at the start of each calendar year, so that delivery schedules can be determined, in adnance, that meet the compact requirements. A model developed to aid in the prediction of these index

U. OF I. URBANA CHAMPAIGN

flows is presented. Multiple regression analysis is applied using 24 years of streamflow, precipitation, and snow water contents records. Using this historic data and the IBM 360 system, equations are developed to predict the volumetric flows for the Rio Grande, Conejos, and Los Pinos Rivers at index stations. Results of the analysis are presented in the form of one equation for each month. (Bell-Cornell)

TWO-AND THREE-DIMENSIONAL INFILTRATION: SEEPAGE FROM IRRIGATION CHANNELS AND INFILTROMETER RINGS,
Agricultural Research Council, Cambridge (England). Unit of Soil Physics.
E. G. Youngs.
J Hydrol (Amst). Vol 15, No 4, p 301-315, 1972. Illus.
Identifiers: Channels, Hydraulic, *Infiltration, Infiltrometer rings, *Irrigation channels, Laboratory tests, Pressure, Sand, *Seepage, Hydraulic conductivity.

The steady seepage rates at large times from flat-bottomed channels and channels of semicircular cross-section were determined in laboratory tank experiments using various sands. Good agreement was found with the theoretical relationships which assume the flow to be confined to a saturated region bounded by a capillary-fringe surface and to be uniform and vertical at great depths. The steady large-time seepage rates were also obtained in laboratory sand-tank experiments for the 3-dimensional cases of seepage from circular shallow ponds and hemispherical sources. These agree with relationships obtained using an electrolytic tank analogue with approximate boundary conditions assumed for the flow region. A method of analysis of large-time seepage measurements from irrigation channels and infiltrometer rings is proposed, which yields the hydraulic conductivity and pressure head at the wetting front from experiments with different size channels or rings.–Copyright 1973, Biological Abstracts, Inc.

AN EVALUATION OF CURRENT PRACTICES IN SEEPAGE CONTROL,
Arizona Water Resources Research Center, Tucson.
D. G. Boyer, and C. B. Cluff.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 125-152, (1972). 3 tab, 5 fig, 15 ref. OWRR A-035-ARIZ (1).

Descriptors: *Seepage control, *Ponds, *Lakes, *Surface water, *Costs, Physiochemical properties, Infiltration rates, Plasticity, Soil amendments, Arizona, Plastics.
Identifiers: Hydrophobic chemicals, Monovalent cations.

Increased seepage control from natural and artificial waters are apparently necessary with increased frequency of construction and use of small ponds and lakes. Seepage control methods are becoming more numerous and diverse. Comparisons of effectiveness, longevity, and costs are not readily available. Control techniques used in Arizona are evaluated in terms of the above comparisons. Emphasis is placed on physiochemical methods, such as plastic, soil compaction aids, hydrophobic chemicals and monovalent cation applications. Results of field comparison tests using double-ring infiltrometers are presented. Limitation of the control products are discussed. Additional research should be undertaken to improve the technology of seepage control. (See also W73-10818) (Popkin-Arizona)

Descriptors: *Input-output analysis, *Stochastic processes, *Decision making, *Optimization, *Operations research, Regulation, Reservoir operation, Linear programming, Dynamic programming, Simulation analysis, Mathematical studies, Probability, Numerical analysis, Streamflow, Watershed management, Computer programs.

New and improved methods of determining optimal operating rules for reservoirs are progressive aspects of the past decade. Deterministic linear programming, deterministic dynamic programming, stochastic linear programming, stochastic dynamic programming and simulation are the major techniques. The use of discrete conditional dependency matrices as input to stochastic decision models is examined. Conditional probabilities that are generated are not accurate. Approximation for numerical integration is required for input in dependence matrices. The real value of transforms for highly skewed streamflows may be realized when studying watersheds in an arid region. Meaningful conditional probability dependency matrices can be constructed to obtain an optimal operating policy for a reservoir. Problems and initial assumptions in the construction of matrices, the transform relating gamma space with normal space, a new transform for highly skewed data, and the possibility of using the matrices to provide realistic inputs to a stochastic dynamic program are discussed in detail. MECHANICAL EQUIPMENT USED FOR AQUATIC PLANT CONTROL IN LOUISIANA,
Army Engineer District, New Orleans, La.
W. E. Thompson.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 5-11, 1972.

Descriptors: *Aquatic weed control, *Mechanical control, *Louisiana, Equipment, Costs, Disposal, Harvesting.

Louisiana uses several mechanical methods to control aquatic weeds in its 10,000 miles of waterways and 500,000 acres of wet lands infested with water hyacinth and alligator weed. A mechanical cropper boat has destroyed large areas of aquatic plants by piling them on banks. Drifting is frequently employed and is accomplished by driving a saw boat through the growth as close to the bank as possible and cutting the growth away from its anchorage; the floating mat is cut by the same equipment into pieces which are started downstream with the current, to salt water and destruction. To control free drifting vegetation from one stream to another and the drifting from feeder areas into main channels a system of booms and barricades located in the various waterways is utilized. A self-propelled, heavy-duty roll-crusher destroyer is also used; the vegetation is fed between its two rollers whose crushing action injures the plants precluding further growth. The saw-boat destroys growth by damaging the rhizome of water hyacinth making it incapable of propagation. Description of each method, costs, and effectiveness are described. CURRENT INVESTIGATIONS IN THE JACKSONVILLE DISTRICT CONCERNING MECHANICAL HARVESTING OF OBNOXIOUS AQUATIC PLANTS,
Army Engineer District, Jacksonville, Fla. Aquatic Plant Control Section; Florida Dept. of Natural Resources, Tallahassee; and Florida State Game and Fresh Water Fish Commission, Tallahassee.
C. F. Zeiger, L. M. Curtis, and J. W. Wood.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 13-16, 1972.

Descriptors: *Mechanical control, *Harvesting, *Aquatic weed control, Florida, Water hyacinth, Fertilizers, Pulp and paper industry, Disposal, Feeds, Soil amendments.
Identifiers: *Utilization studies, Jacksonville (Fla), St. Johns River (Fla).

The Army Engineers, Jacksonville District, Florida, has been studying mechanical harvesting of aquatic weeds in cooperation with several state agencies and industries. The utilization studies include determination of possible use as a feed or feed supplement for livestock, with procedures for the best plant preparation and feeding trials; water hyacinth as a soil amendment with a study of its benefit to soil as partial or entire substitute for chemical fertilizer; the paper-making properties of water hyacinth with estimates of the market value of pulp made from hyacinth. To date water hyacinths as feed are more acceptable than hydrilla or coastal Bermuda. Complete chemical analyses of water hyacinths and the soil amended with water hyacinths are to be made. A contract has been entered into for design of an experimental hyacinth harvester to be tested on the St. Johns River. One aspect of harvesting that could be investigated is the possibility of pumping harvested, chopped hyacinth from the harvester site to a disposal area. On a large-scale basis this would be much less expensive than trucking the plants. (See also W73-10951) (Jones-Wisconsin)

AQUATIC PLANT CONTROL IN THE PANAMA CANAL,
Corps of Engineers, Philadelphia, Pa. Operations Div.
R. W. Lowry.
In: Proceedings Research Planning Conference on Aquatic Plant Control Project, January 12, 1972, Vicksburg, Mississippi, p 17, 1972.

Descriptors: Aquatic weed control, Mechanical control, Equipment, Panama Canal.

Mechanical removal of floating aquatic weeds from the Chagres River, main tributary of the Panama Canal, has proven to be successful. Huge islands of hyacinth and other noxious plants float down the river after heavy rains and are trapped by a log boom. When the boom is loaded, one end is disconnected from the bank and powerful launches pull the free end upstream and across the river. Weeds caught on the boom are pushed into a basin where a Sauerman slackline operates. The 2-ton capacity bucket picks up the weeds and dumps them high on the bank where they decay and, eventually, are sufficiently dehydrated to burn. Experiments with mechanical removal of rooted emersed aquatic plants, such as elodea, and disposal by dump barges were not particularly successful. The physical laceration of the plants tended to have a cultivating effect on regrowth and the barges did not dump well in the water. (See also W73-10951) (Auen-Wisconsin)

FLOOD PLAIN INFORMATION--MEADOW CREEK, EAGLE RIVER, ALASKA.
Army Engineer District, Anchorage, Alaska.

Flood Plain Report, April 1973. 26 p, 12 fig, 12 plate, 2 tab.

Descriptors: *Floods, *Flood data, *Flood damage, *Flood frequency, *Alaska, Flood discharge, Flood forecasting, Historic floods, Flood control, Land management, Planning, Streamflow, Stream gages.
Identifiers: *Eagle River (Alaska), *Meadow Creek (Alaska), Intermediate regional flood, Standard project flood.

The portion of the community of Eagle River, Alaska, covered by this report is subject to flooding from Meadow Creek. The properties along this stream are primarily residential and have been

UNIV. OF ILL. URBANA CHAMPAIGN

moderately damaged by the flood of August 1971. A history of flooding in Eagle River is presented and areas subject to possible future floods are identified. Special emphasis is given to these floods through maps, photographs, profiles and cross sections. The report does not provide solutions to flood problems; however, it does furnish a suitable basis for the adoption of land use controls to guide flood plain development and thereby prevent intensification of loss and damage. It will also aid in the identification of other flood damage reduction techniques such as works to modify flooding and adjustments, including flood proofing. (Woodard-USGS)

EVALUATION OF TECHNIQUES FOR SELECTING SITES FOR INDUCED INFILTRATION ALONG THE ALABAMA RIVER,
Geological Survey of Alabama, University.
Leon Scarbrough, and R. E. Kidd.
Available from the National Technical Information Service as PB-220 961, $3.00 in paper copy, $0.95 in microfiche. Geological Survey of Alabama, Circular 84, 1972. 77 p, 26 fig, 75 ref. OWRR A-014-ALA (1).

Descriptors: *Infiltration, *Induced infiltration, *Hydraulic conductivity, *Electrical resistivity, *Permeability, Aquifers, Alabama, *Aerial photography, Flood plains.
Identifiers: *Alabama River (Ala), Photogeography, *Shallow aquifers.

This study includes the application of photogeologic, geophysical and auger test-drilling methods in the flood plain of the Alabama River to locate and define deposits that would be good shallow aquifers having definite potential for hydraulic connection to the river. Aerial photographs were studied to assist in locating abandoned river channels and other areas in which shallow aquifers might exist. Prospective areas were then delineated, and geophysical studies and an auger test drilling program were implemented. Refraction seismic and electrical resistivity methods were used to attempt to locate sand and/or gravel deposits. Electrical resistivity became the primary geophysical method used when experience indicated that sand and gravel deposits were more resistive than the associated clay and silt deposits. Sand, gravel and clay deposits were located and mapped with the electrical resistivity instrument. The difference in conductivity between sand and gravel is very slight; therefore, it is difficult to determine if a deposit contains only sand or if it contains sand and gravel. Abandoned channels were located and the thickness of sand and gravel bodies were determined from seismic and auger test-drilling data.

AN ECONOMIC MODEL OF AN AREA'S RESPONSE TO DEPLETION OF ITS WATER RESOURCES,
Kansas Water Resources Research Inst., Manhattan.
R. W. Ruppert, and G. S. Clausen.
Available from the National Technical Information Service as PB-220 962, $3.00 in paper copy, $0.95 in microfiche. Contribution No 116, December 1972, 30 p, 5 fig, 2 tab, 10 ref. OWRR A-035-KAN (1). 14-31-0001-3216.

Descriptors: Groundwater mining, *Alternative planning, Income, *Kansas, Water transfer, Model studies, Irrigation efficiency, Benefits, Alternative water use, Water utilization.
Identifiers: *Economic models, *Groundwater depletion.

Irrigation development has led many areas to depend upon mining of local groundwater for considerable proportions of their income. As groundwater depletion takes place these areas can develop alternative supplies, instigate economically advantageous transfers, or incur reductions in population and income because of migration. A conceptual economic model is presented for determining the appropriate combination of the alternatives for an area to use and the way in which the combination should be varied over time as the depletion continues. Little emphasis is placed on empirical findings for case study areas, however, some detailed work is presented on migration habits to be expected in Western Kansas.

HYDRAULIC TESTING AND SAMPLING OF WATER WELL NUMBER 2, PROJECT WAGON WHEEL, SUBLETTE COUNTY, WYOMING,
Geological Survey, Lakewood, Colo.
G. A. Dinwiddie.
Available from NTIS, Springfield, Va 22151, USGS-474-142 Price $4.00 printed copy; $0.95 microfiche. Geological Survey Publication USGS-474-142, April 1973. 32 p, 13 fig, 1 tab, 2 ref. AEC At (29-2)-474.

Descriptors: *Hydraulics, *Water quality, *Test wells, *Wyoming, Water yield, Pumping, Drawdown, Transmissivity, Pressure head, Water analysis, Chemical analysis, Fluid mechanics, Oil industry, Groundwater recharge.
Identifiers: *Sublette County (Wyo).

Wagon Wheel Water Well No. 2 was drilled to obtain hydraulic data at the site of Project Wagon Wheel, a Plowshare Project in the Green River basin of Sublette County, Wyoming. Two intervals in the 5,200-foot hole were hydraulically tested and samples of water were obtained. Results of testing the upper interval, near the 2,300-foot level, indicate that transmissivity is about 710 gallons per day per foot, and that the static water level, after correction for density, is 99.4 feet below land surface. Water from this upper interval is fresh. Results of testing the lower interval, near the 5,000-foot level, indicate that transmissivity is about 5.4 gallons per day per foot, and that the static water level, after correction for density, is 56.4 feet below land surface. Water from this lower interval is highly saline. Pressure head increases with depth, indicating the potential for upward movement of fluid. However, the great difference in chemical quality of fluid samples collected from the two tested intervals indicates that significant vertical movement of fluid upward is unlikely in the vicinity of the well. NOTES ON DEVELOPING GROUND WATERS,
International Water Supply Association, Montreal (Quebec).
P. O. Bourgeois.
Water and Pollution Control, Vol 110, No 10, p 24-28, October, 1972. 5 fig.

Descriptors: Groundwater, *Groundwater availability, *Groundwater recharge, Groundwater mining, Infiltration galleries, Recharge, Pollution, Septic tanks, Effluents, Chlorination, Soil filters, Surveys, *Test wells, Wells, Water wells.
Identifiers: *Horizontal wells, Cone of depression, *Record keeping, Ground water pollution, Test pumping.

Advantages in developing ground water resources over surface waters for water supply and some methods for doing so are briefly discussed. Principles of artificial recharge, induced infiltration, and ground water recirculation are given. It is emphasized that well construction should be executed properly--and that when constructed by competent conscientious experts, a well should be a work of art and engineering. Analysis of geological conditions forms the first part of a ground water development program. Test drilling and pumping, to establish actual transmissivities, individual well potential yields, and complete well field yields, is then carried out. Horizontal wells and infiltration galleries are mentioned, to which the same general hydrologic and geophysical laws apply as to vertical wells. Ground water pollution is discussed, with detergent effluents from septic tanks singled out as a major pollutant. The value of record-keeping by the individual drilling or owning a well or well field is emphasized. (Smith-NWWA)

GAS IN GROUND WATER.

Journal of the American Water Works Association, Vol 61, No 8, p 413-414, August, 1969.

Descriptors: Groundwater, *Methane, Gases, Hydrogen sulfide, *Explosions, Gravels, Glacial sediments, Ventilation, *Decomposing organic matter, Aeration.
Identifiers: Gas-air mixture, *Flammable gases.

A summary of gas characteristics in ground water is given in order to acquaint water utilities employees and others with its nature, origins, and hazards. Both methane and hydrogen sulfide are common flammable gases found in ground water, the latter being less dangerous because it has a distinctive odor. Examples of isolated explosions attributed to gas in ground water occurring in Michigan and New York State, as well as a possible one in Louisiana, are mentioned. The minimum concentration of methane in water sufficient to produce an explosive methane-air mixture (5-15 per cent methane in a gas-air mixture) above the water from which it evolves can be as little as 1.1 ppm at normal conditions, in poorly ventilated air spaces. Under these conditions explosions can occur in shower stalls, water treatment plants,

storage reservoirs, water tanks, and other poorly ventilated air spaces. Suffocation is another hazard of gas in ground waters. Safety measures for decreasing the hazards include aeration of the water before use, and adequate ventilation of air spaces around the well in places where the water is to be used. (Campbell-NWWA)

ELECTROMAGNETIC DEPTH SOUNDING EXPERIMENT ACROSS SANTA CLARA VALLEY,
California Univ., Berkeley. Dept. of Geoscience Engineering.
J. Ryu, H. F. Morrison, and S. H. Ward.
Geophysics Vol 37, No 2, p 351-374, April 1972. 25 fig, 16 ref. OWRR B-067-CAL (3). 14-31-0001-1878.

Descriptors: *Electromagnetic waves, *California, Measurement, *Remote sensing, Depth.
Identifiers: *Santa Clara Valley (California).

An electromagnetic depth sounding experiment with a horizontal loop carrying an oscillating current was carried out in Santa Clara Valley, California. The field data are interpreted in terms of the polarization parameters of the magnetic polarization ellipse. The chosen parameters are tilt-angle, ellipticity, and the modulus of wave-tilt. The electrical discontinuities deduced are in general agreement with well data and with a geologic section based on resistivity soundings. The results clearly reveal an intermediate, highly resistive layer, which is a permeable stratum for groundwater recharge. It is concluded that a portable electromagnetic sounding system, measuring only tilt-angle and ellipcity, should easily locate highly resistive gravel deposits bounded by conductive clay beds. The system is useful in those regions where it is extremely difficult to inject current into the ground.

ROLE OF CONNECTICUT RIVER FLOOD FLOWS IN RECHARGING GROUND-WATER FORMATIONS,
Massachusetts Univ., Amherst.
O. C. Farquhar.
In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area. Massachusetts Water Resources Research Center, Publication No. 25, 1973, Appendix G, 3 p. OWRR C-2169 (No. 3377) (1).

Descriptors: *Groundwater, *Groundwater recharge, Flood flow, *Diversion, Water levels, *Aquifer systems, *Connecticut River, *Interbasin transfers.

The effect of flood water diversions from the Connecticut River on groundwater recharge is explored. An extensive system of aquifers is linked to the Connecticut River and these aquifers not only provide public water supply but also help maintain a base flow in the river. A study of the available literature on proposed diversions from the Connecticut River up to the year 2020 shows that the level of the river could be reduced from .2 ft. to 1.6 feet. This decrease in river stage would be much less in the State of Connecticut and in any case is quite small compared to daily fluctuations due to the operation of small impoundments for industrial purposes. Thus, it is concluded that the flood water diversions would have no adverse effect on the aquifers in the basin. (See also W73-10726). (Elfers - North Carolina).

GROUNDWATER RESOURCES OF COKE COUNTY, TEXAS,
Geological Survey, Austin, Tex.
C. A. Wilson.
Texas Water Development Board, Austin, Report 166, March 1973. 87 p, 15 fig, 7 tab, 45 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Hydrogeology, *Water wells, *Texas, Water yield, Pumping, Water utilization, Industries, Irrigation, Domestic water, Livestock, Water quality, Salinity, Chemical analysis, Oil industry, Brines, Water pollution sources, Groundwater recharge.
Identifiers: Coke County (Tex).

Coke County, located in semiarid west-central Texas, where large ranches, small farms, and oil production are the main bases of the economy, has a small supply of groundwater and surface water. Of the approximately 1,900 acre-feet of fresh to moderately saline groundwater used in 1968, industry used 880 acre-feet, irrigation used 210 acre-feet, and domestic supply and livestock used 820 acre-feet. All of the water for municipal supply and some of the water for industry is obtained from surface-water reservoirs. The oldest geologic units cropping out in the county are the westward-dipping Permian 'red beds'. Groundwater in the Permian rocks is usually of the calcium-magnesium and sulfate or bicarbonate type. Most of the water samples in the Permian rocks contained more than 1,000 mg/liter dissolved solids. The most favorable areas in the county where well yields exceeding 50 gpm can be expected are: (1) in the floodplain alluvium along the Colorado River; (2) the 'older alluvium' in the southwestern corner of the county; and (3) in the southeastern part of the county near Tennyson, where wells may penetrate solution openings and fractures in the dolomitic beds of the Clear Fork Group. 'IRON WATER' FROM WELLS: CAUSES AND PREVENTION,
Geological Survey, Austin, Tex.
M. E. Broom.
Ground Water, Vol 4, No 1, p 18-21, January, 1966. 1 fig, 5 ref.

Descriptors: Wells, *Water wells, *Groundwater, *Iron, Oxidation, Reduction (Chemical), *Texas, Hardness (Water), Stratification, Oxidation-reduction potential, Geochemistry, Domestic water, Aquifer characteristics, Zoning.
Identifiers: Iron stains.

Chemical analyses of ground-water samples taken from differing depths in a four-county area in east Texas showed a general stratification with respect to dissolved iron, pH and hardness. On the basis of this stratification the waters of the groundwater reservoir were divided into a shallow zone of oxidation, A; a deep zone of reduction, C; and an intermediate and unstable zone, B, in which waters from above and below are mixed. Groundwater from zones A and C generally is almost free of iron, whereas water from zone B generally contains objectionable amounts. This zoning is explained by recent laboratory work and theoretical data on iron in natural waters. Wells constructed to draw only from zones A or C should yield water relatively free of iron. GEOHYDROLOGY,
Kennecott Copper Corp., Lexington, Mass.
A. D. Pernichele.
Mining Engineers, Vol 25, No 2, p 67-68, February, 1973. 6 ref.

Descriptors: *Mine acids, Mine drainage, *Mineral industry, Leaching, *Environmental effects, Research and development, Waste dumps, Acids, Groundwater, Resistivity, Tracers, Copper, Hydrogeology, Illinois, Wisconsin.
Identifiers: Ore bodies, Uranium.

Use of the science of geohydrology to contribute to solution of a variety of problems related to mining, such as slope stability, in situ leashing, dump leaching and land rehabilitation, is expanding rapidly. The potential for damage to groundwater and surface water resources must be routinely considered when evaluating, planning and designing projects related to mining. Laws of Illinois and Wisconsin relating to permits for mining in order to control and avoid damage to the environment are oulined. EPA studies of the effects on groundwater of in situ leaching of copper ore are given. Current research and projects in connection with environmental factors of mining are described. The emphasis for the next few years will be on analysis of environmental impact as the industry is brought under increased pressure to minimize the effects of mining on the environment. (Smith-NWWA)

AN INVESTIGATION OF THE SESMIC WAVE PROPAGATION PROPERTIES OF A THIN UNSATURATED LAYER AS A WAVE GUIDE,
Michigan State Univ., East Lansing. Dept. of Geology.
R. C. Todd.
M. Sc Thesis, 1971. 116 p, 26 fig, 2 tab, 15 ref. OWRR B-006-MICH (4). 14-01-0001-1513.

Descriptors: *Seismic waves, *Seismology, *Earthquakes, *Michigan, *Exploration.
Identifiers: *Seismic refraction model (Three-layer), Udell experimental forest, Outwash plains, Morainal features, Michigan formation.

Three-component recording can provide information about a surface layer that would be missed in conventional vertical recording. A more accurate compressional velocity determination in the surface layer and the discovery of a surface wave related to the direct arrival resulted from analysis of the three-component data. Plots of the magnitude of particle velocity without reference to direction are useful in the interpretation of three-component seismic signals. The method is new and is potentially valuable in recognizing some seismic arrivals that might otherwise be overlooked. The surface wave discovered through the use of this method apparently has not been reported in the literature. Its propagation is linked to the wave guide properties of a relatively thin surface layer with a low velocity relative to the underlying material. It is identified on an observational basis by its elliptical particle motion and its arrival time. It can be predicted at least in a qualitative sense from the theory of seismic ray propagation. Some aspects of seismic theory related to phase changes upon reflection have been experimentally confirmed. A phase reversal occurs with reflection from a free surface and no phase change occurs with reflection from an interface with material having a higher acoustic impedance. (Richardson-Michigan State)

UNSTEADY FLOW TWOARD AN ARTESIAN WELL,
Kentucky Univ., Lexington. Dept. of Civil Engineering.
Y. H. Huang.
Water Resources Research, Vol 9, No 2, p 426-433, April 1973. 6 fig, 1 tab, 7 ref. OWRR A-042-KY (2) B-002-KY (3).

Descriptors: *Finite element analysis, *Unsteady flow, *Artesian wells, *Drawdown, Hydraulic models, Computer programs, Groundwater movement, Artesian aquifers.

Unsteady drawdown around an artesian well may be calculated using a finite element method programmed for a high-speed computer. On the basis of assumptions that the well has a finite radius and that the discharge from a partially penetrating well is not uniform along the well bore, numerical solutions for various well penetrations are presented and compared with the experimental measurements from a sand model. The numerical solutions check reasonably with the experimental measurements. (Knapp-USGS)

EFFECT OF A WATER TABLE AQUITARD ON DRAWDOWN IN AN UNDERLYING PUMPED AQUIFER,
Nevada Univ., at Reno. Center for Water Resources Research.
R. L. Cooley, and C. M. Case.
Water Resources Research, Vol 9, No 2, p 434-447, April 1973. 5 fig, 27 ref. OWRR A-045-NEV (1).

Descriptors: *Ground water movement, *Aquitards, *Drawdown, Saturated flow, Artesian aquifers, Water yield, Unsaturated flow, Equations, Confined water, Storage coefficient.

The vertical velocity at the base of a water table aquitard having negligible compressibility may be described by a convolution integral either theoretically derived or yielded by N.S. Boulton's originally empirical 'delayed yield' theory. The derivation requires that fluid compressibility be neglected and that water be obtained from storage by instantaneous desaturation (or saturation) with a declining (or rising) water table. An expression for the delay index shows that it is a function of hydraulic conductivity, specific yield, and thickness of the aquitard. To evaluate the effect that gradual desaturation may have on flow in a water table aquitard, flow in the unsaturated zone was approximated by an analytical solution of Richards' equation assuming time invariant power law functions for change of both capillary conductivity and moisture content in the vertical. An equation was derived that shows that the length of time for which gradual desaturation could influence flow in the saturated zone is a function of the hydraulic conductivity and specific yield of the aquitard and the thickness of the capillary fringe. To investigate the effect that delayed yield could have on flow in the aquifer, analytical solutions were made for flow to a well pumping at a constant rate in a compressible aquifer overlain by a compressible water table aquitard. Comparison of results that consider delayed yield effects with those that do no suggests that the unsaturated zone has little effect on flow in the aquifer. (Knapp-USGS)

WATER-LEVEL DECLINE AND PUMPAGE IN DEEP WELLS IN NORTHERN ILLINOIS, 1966--1971,
Illinois State Water Survey, Urbana.
R. T. Sasman, C. R. Benson, G. I. Dzurisin, and N. E. Risk.
Circular 113, 1973. 41 p, 10 fig, 4 tab, 10 ref, append.

Descriptors: *Water levels, *Drawdown, *Deep wells, *Aquifer characteristics, *Illinois, Hydrogeology, Water utilization, Water supply, Municipal water, Industrial water, Domestic water, Pumping, Water yield, Water level fluctuations, Hydrologic data, Basic data collections, Reviews, Evaluation.
Identifiers: Northern Illinois wells, *Water level decline (Wells).

Trends in water levels and pumpage from deep wells in northern Illinois are summarized from records for the end of 1966 through 1971. The Cambrian-Ordovician aquifer is encountered at depths ranging from less than 100 feet in areas of northwestern Illinois to an average of about 500 feet below land surface at Chicago; it has an average thickness of 1,000 feet and is composed chiefly of sandstones and dolomites. During the period from 1966 through 1971, pumpage from deep wells increased to 239.0 mgd, an increase of 23.6 mgd or 11% more than the 1966 pumpage. Pumpage in the Chicago region increased to 150.7 mgd, an increase of 12.5% since 1966. This increase has resulted in excessive water-level declines in some deep wells. For the Chicago region, average annual water-level declines during the 5-year period ranged from 4 feet in Grundy County to 14 feet in Lake County and averaged about 9 feet. Water levels in 11 selected observation wells outside the Chicago region declined an average of 1 foot per year during the same period. If the distribution of pumpage remains the same and pumpage continues to increase, the principal water-yielding units of the aquifer will be partially dewatered in many areas much sooner than previously anticipated. THE INFLUENCE OF BENTHIC BARK DEPOSITS ON AQUATIC COMMUNITY AND THE QUALITY OF NATURAL WATERS,
Oregon State Univ., Corvallis. Water Resources Research Inst.
F. D. Schaumburg, and J. Walker.
Available from the National Technical Information Service as PB-220 952, $3.00 in paper copy, $0.95 in microfiche. Final Research Report: May 1973, 24 p, 8 fig, 2 tab, 11 ref. OWRR A-012-ORE (1).

Descriptors: *Bark, Estuaries, *Lumbering, Food chains, *Benthos, *Oregon.
Identifiers: *Yaquina Bay.

The water storage and transport of logs is commonplace in the Pacific Northwest. The effect of bark deposits on the benthic ecosystem, including numerous species of macro-invertebrates, was investigated. These and other organisms are important links in the food chain for fish and shellfish which inhabit lakes, streams, and estuaries used for log storage. Based upon the results of this study, bark deposits appear to have little or no detrimental effect on the benthic macro-invertebrates which inhabit Yaquina Estuary. Under different situations such as those in which negligable water movement is available above bark deposits, the increased oxygen demand of the bark might affect the water column to the extent that a decrease in the benthic fauna would result.

Descriptors: *Sediment transport, *Land development, *Urbanization, *California, Sediment yield, Floods, Streamflow, Hydrologic data, Data collections, Stream gages, Sampling, Suspended solids, Sedimentation, Correlation analysis, Environmental effects, Geology, Topography, Vegetation, Land use, Rainfall-runoff relationships.
Identifiers: *Colma Creek basin (Calif.).

Some of the changes are described in water and sediment discharge that occurred in the Colma Creek basin in California during a period of major urban expansion. Hydrologic data collected from 1964 to 1971 were used to evaluate trends and relations between sediment yield and land use. Total

sediment yield upstream from the Colma Creek gaging stations ranged from 3,400 to 14,000 tons per square mile during 1966-70. Sediment discharge rates of Spruce at South San Francisco were relatively stable in 1966-67, but increased sharply in 1968 and 1969 owing to increased construction activity and to sediment losses from a debris basin which was breached several times during large storms. Annual suspended-sediment yield upstream from the Spruce Branch gaging station ranged from 2,800 to 39,000 tons per square mile during the period 1966-69. Future sediment yields of the Colma Creek basin will undoubtedly be lower than yields observed during the study period when construction activity was high. If the basin becomes completely urbanized (65% urban and 35% open space), it is probable that sediment yields for the entire basin will range from 9,700 tons in a year of average rainfall to 25,000 tons in a year of extremely high rainfall. UNDERGROUND CORROSION AND SALT INFILTRATION,
Connecticut Univ., Storrs, Dept. of Civil Engineering.
P. M. Berthouex, and G. A. Prior.
Journal of the American Water Works Association, Vol 60, No 3, p 345-356, March, 1968. 6 fig, 27 ref.

Descriptors: Corrosion, Corrosion control, Electrolytes, *Salts, *Highway icing, Leaching, Chlorides, Calcium chloride, Sodium chloride, Resistivity, Soil chemistry, *Soil water movement.
Identifiers: Buried pipes, *Galvanic cells.

The mechanism of salt penetration into the soil and the possible effects of infiltrated salts on underground corrosion are discussed. Soil samples from an area along a main New England highway were obtained at distances of 5, 25, 50, and 100 ft. from the edge of the paved shoulder. At each of these locations soil samples were taken from the surface and at depths of 1/2, 1, 2 and 3 ft. Three snowfalls had occurred before sampling was initiated. Greatest salt concentrations were found near the highway, with the highest concentration, 450 ppm, measured at the surface 5 ft. from the pavement. In general, the salt concentration decreased with depth, and the fluctuations in salt concentration were smaller at greater depths. Infiltrated salts will decrease the soil resistivity and generally promote increases in corrosion rates. Also, the natural leaching process produces concentration differences over narrow depths which can create galvanic cell corrosion, the importance of which will depend upon the stability of the anode location. These effects are related to soil drainage. (Smith-NWWA)

SPECTROGRAPHIC ANALYSIS OF METALS IN FRESHWATER SEDIMENTS,
Eastern Michigan Univ., Ypsilanti. Dept. of Chemistry.
S. W. Brewer, Jr.
Available from the National Technical Information Service as PB-220 949, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, Michigan Institute of Water Research, State University, May 1973. 38 p, 5 fig, 11 tab, 9 ref. OWRR A-056-MICH (1). 14-31-0001-3522.

Descriptors: *Spectroscopy, *Michigan, Analytical techniques.
Identifiers: *Huron River (Mich), *Atomic absorption analyses, Graphite spark technique.

Sediment samples were collected along the entire Huron River. In order to develop analytical procedures, samples from sites near Ypsilanti were selected. These samples were analyzed qualitatively by dc arc spectroscopy, and showed Al, Si, and Mg present at levels>1%, Fe present at roughly 0.1%, Mn present at < 0.1%, and Cu and Zn present at lower levels than Mn and Pb present at trace levels. Atomic absorption analyses of leach liquors from these sediments show good correspondence with the arc results for Fe, Mn, Cu, and Cr. High-voltage spark studies, using the graphite spark technique are in progress, and indicate that detection of 0.5 ppm of metal in a 0.775 ml sample of leach liquor is feasible.

A RAPID SENSITIVE METHOD FOR THE DETERMINATION OF THE CHEMICAL OXYGEN DEMAND OF POLLUTED WATERS,
Oak Ridge National Lab., Tenn.
W. W. Pitt, Jr., S. Katz, and L. H. Thacker.
Available from NTIS, Springfield, Va. 22151 as CONF-720827-2 Price $3.00 printed copy; $0.95 microfiche. Preprint presented at 73rd National Meeting of the American Institute of Chemical Engineers, August 30, 1972, Minneapolis, Minnesota: Atomic Energy Commission, Oak Ridge National Laboratory Publication, 1972. 20 p, 7 fig, 2 tab, 1 append.

Descriptors: *Chemical analysis, *Water analysis, *Chemical oxygen demand, *Pollutant identification, *Fluorometry, Methodology, Analytical techniques, Correlation analysis.

A rapid, sensitive cerate oxidative method for measuring the chemical oxygen demand (COD) of waters is described. The pollutants are oxidized with perchlorato-cerate reagent and the resulting cerium (III) is determined fluorometrically. Analysis requires only a few minutes for determinations at levels as low as 100 micrograms of oxygen demand per liter. Results of tests on solutions of known organic compounds, various industrial waste streams, and natural waters show that the method compares favorably with the dichromate reflux procedure recommended by APHA. However, the new method is considerably faster and easier to use, and is a hundred times more sensitive. An analytical system which is suitable for use as either a continuous COD monitor or as an analyzer for multiple samples in series is described also. (Woodard-USGS)
W73-10434

THE DETERMINATION OF VANDIUM IN BRINES BY ATOMIC ABSORPTION SPECTROSCOPY,
Geological Survey, Washington, D.C.
H. J. Crump-Wiesner, H. R. Feltz, and W. C. Purdy.
Analytica Chimica Acta, Vol 55, p 29-36, 1971. 2 fig, 2 tab, 14 ref.

Descriptors: *Chemical analysis, *Trace elements, *Brines, *Analytical techniques, Metals, Spectrophotometry, Water chemistry, Spectroscopy, Methodology, Laboratory tests.
Identifiers: *Vanadium determinations, Triisooctyl thiophosphate, Methyl isobutyl ketone.

A standard addition method is described for the determination of vanadium in brines by atomic absorption spectroscopy with nitrous oxide-acetylene flame. Sample pH is adjusted to 1.0 with concentrated hydrochloric acid and the vanadium is directly extracted with 5% cupferron in methyl isobutyl ketone (MIBK). The ketone layer is then aspirated into the flame and the recorded absorption values are plotted as a function of the concentration of the added metal. As little as 2.5 micrograms/liter of vanadium can be detected under the conditions of the procedure. Tungsten and tin interfere when present in excess of 5 and 10 micrograms/liter, respectively. The concentrations of the two interfering ions normally found in brines are well below interference levels. (Woodard-USGS)

MERCURY POLLUTION AND LAKE ERIE FISHES,
Michigan State Univ., East Lansing.
C. S. Annett, M. P. Fadow, F. M. D'itri, and M. E. Stephenson.
Michigan Academician, Vol 4, No 3, p 325-337, Winter 1972. 3 fig, 2 tab, 26 ref.

Descriptors: Water pollution sources, *Mercury, *Lake Erie, *Fish, *Sediments, Chemical analysis, Analytical techniques, Pollutant identification, Industrial wastes, Aquatic environment.

Various sources of mercury contribute to the mercury contamination of Lake Erie in the vicinity of the Raisin River. To assess their extent, 79 fish and 37 sediment samples collected from this area of Lake Erie during the fall season of 1970 were analyzed by flameless atomic spectrophotometric techniques. The average concentration of total mercury in the muscle tissue of several species of fish ranged from 0.06 to 1.7 ppm on a wet weight basis, and total mercury concentrations in the sediments ranged from 0.19 to 0.53 ppm on a dry weight basis. No relationship appears to exist between the size of the fish and its total mercury content within a given species. However, a trend in mercury accumulation can be distinguished among species. The mean total of mercury levels has a declining order in perch, goldfish, and carp with values of 0.49, 0.28, and 0.19 ppm of mercury, respectively. (Woodard-USGS)

Environmental samples of oil and oil products can be correlated with possible sources by comparison of their stable compositional features. Procedures for correlating samples with suspected sources by gas chromatographic analysis under standardized conditions are presented in manual form. A high rate of success for the method in realistic situations is estimated by analyses of artificially aged oils and of potential spill sources found in Greater New York Harbor and Portland, Maine. The method is suitable for routine use for weeks-old oil samples, and for monitoring levels of hydrocarbons in organisms and sediments. Slightly modified, it can be used in low-level and research work studying the fate and effects of petroleum hydrocarbons. (Holoman-Battelle)

ANALYSES OF DREDGED WASTES, FLY ASH, AND WASTE CHEMICALS - NEW YORK METROPOLITAN REGION,
State Univ. of New York, Stony Brook. Marine Sciences Research Center.
M. G. Gross.
Available from the National Technical National Information Service as AD-734 337, $3.00 in paper copy, $0.95 in microfiche. Technical Report No 7, October 1970. 33 p, 8 fig, 8 tab, 21 ref. Contract No. DACW-72-70-C0009.

Descriptors: *Sediments, *Heavy metals, *Oxidation-reduction potential, *Chemical analysis, *Sewage sludge, *Chemical wastes, Carbon, Cobalt, Chronium, Cooper, Manganese, Nickel, Lead, Zinc, Titanium, Aluminum, Iron, Magnesium, Calcium, Sodium, Potassium, Tracers, Waste identification, *New York, Industrial wastes, Fermentation, Distribution patterns, Water pollution effects.
Identifiers: Characterization, *Pharmaceutical wastes, *Fly ash, Silver, Boron, Barium, Tin, Vanadium, Silicon.

A study of solid wastes commonly dumped in the ocean near New York Harbor was designed to obtain information on the physical and chemical characteristics of the materials for use in determining types, distribution, and movement of the wastes and for controlling deleterious effects. Wastes were sampled from a wide variety of sources including sewage sludges, waste chemicals, liquid wastes, fermentation wastes, hopper dredge spoils, and fly ash. In addition deposits in the waste disposal areas were sampled. Physical properties determined were bulk density, grain density, and settling velocity. Spectrochemical analysis was used to determine Ag, B, Ba, Co, Cr, Cu, Mn, Ni, Pb, Sn, U, Zn, Si, Ti, Al, Fe, Mg, Ca, Na, K, and C. Oxidation-reduction potential was also determined. Chemical and physical properties of these wastes suggest that they commonly consist of about 20 percent carbonaceous wastes (possibly sewage solids) mixed with low-carbon river-borne silt (median grain size 30 microns) and an unknown amount of industrial wastes. Ash from coal-fired power generating plants was chemically similar to shale but contained appreciable amounts of mullite. Some samples of waste chemicals had high concentrations of such metals as Pb, Sn, and Zn. A preliminary budget of waste solids dumped in the New York Bight indicates that dredged wastes are a major source of oxygen-demanding substances and potentially troublesome metals. Certain metals, especially Ag and Pb, and the high carbon concentrations are promising as tracers in delineating distributions and subsequent movement of waste deposits in the region. Identifiers: *Water quality index, *Data interpretation, Fecal coliforms.

Multi-attribute scaling procedures were used to develop water quality indices for waters to be used for human consumption and for support of fish and wildlife. Scaling procedures were applied to this task by assessing, from water quality engineers, (1) judgements about which variables should be included in the index, (2) the type of rule for combining the variables, (3) the relative importance weights of the different variables, and (4) a curve describing the functional relation between water quality and each variable. A modified Delphi procedure was used for obtaining concensus among the engineers for each of the indices. Even after the applications of the Delphi procedure, the engineers disagreed on the importance weights, so a sensitivity analysis applied the different indices to actual measurements on samples of river water. This analysis indicated that the disagreement about the weights was not crucial to the measurement of water quality. The parameters considered as indicators of water quality were: fecal coliforms, phenols, DO, dissolved solids, pH, fluorides, Hardness, nitrates, chlorides, alkalinity, turbidity, color, sulfates, temperature, ammonia, and phosphates. An additive equation was used to combine the chosen parameters into a water quality index. (Little-Battelle)

OIL/WATER INTERFACE DETECTOR,
Esso Research and Engineering Co., Florham Park, N.J.
J. O. Moreau.
Available from the National Technical Information Service as COM-72-11295, $3.00 in paper copy, $0.95 in microfiche. Final Report No. EE.4TMR.72, December 1971. 99 p, 7 ref, 3 append. Project No. Task II, Sub-Task I. Contract No. C-1-35049.

Descriptors: *Oil-water interfaces, *Oily water, *Electrical equipment, Pollutant identification, Costs, Oil, Oil pollution, Water pollution sources, On-site investigations, Monitoring, Electronic equipment.
Identifiers: *Detectors, *Detection limits, On board analysis, Sensors.

A survey of manufacturers was conducted to find all equipment that could differentiate between oil and water on a continuous basis and thus be used as an oil-water interface detector during tanker deballasting. Twenty-five possibly applicable devices were found. Based on manufacturers' information, these devices were evaluated in relation to shipboard conditions such as installation, safety, maintenance, and operation requirements. The device which seems best suited to ballast control applications is the Sensall 440 Series In-Line Interface Sensor which measures sonic attenuation. The Sensall would have a probe detector mounted in the discharge line and would alarm at oil concentrations well below 1 percent. Laboratory and shipboard tests would be required, however, before this device could be recommended for installation aboard ship. The NUS sonic interface detector and the Gallbrith Oil Overboard Discharge Alarm system will also merit further study if they can be modified to meet shipboard safety restrictions. (Little-Battelle)

PRELIMINARY ANALYSES OF URBAN WASTES, NEW YORK METROPOLITAN REGION,
State Univ. of New York, Stony Brook. Marine Sciences Research Center.
G. M. Gross.
Available from the National Technical Information Service as AD-746 959, $3.00 in paper copy, $0.95 in microfiche. Technical Report No. 5, February 6, 1970. 32 p, 5 fig, 9 tab, 8 ref. Grant No. DACW 72-70-C-0009.

Descriptors: *Sewage sludge, Pollutant identification, Methodology, *Alkali metals, *Alkaline earth metals, *Heavy metals, Industrial wastes, Chemical analysis, Soil analysis, Sedimentary rocks, Sampling, Sewage treatment, Chromium, Copper, Zinc, Pollutants, New York, Iron, Aluminum, Calcium, Magnesium, Boron, Phosphorus, Titanium, Lead, Manganese, Nickel, Molybdenum, Cadmium, Sodium, Cobalt, Potassium, Strontium, Mercury, Beryllium, Carbon, Sulfides.
Identifiers: *Rare earth elements, *Optical emission spectroscopy, Aluminosilicates, Chemical recovery, Sample storage, Sample preservation, Accuracy, Precision, Reproducibility, Loss-on-ignition procedure, Wet combustion procedure, Sample preparation, *New York Bight, Tin, Silver, Spectrochemical analysis, Carcinogens, Silicon, Barium, Bismuth, Vanadium, Zirconium, Arsenic, Antimony, Thallium, Gallium, Yttrium, Ytterbium, Cerium.

Preliminary analyses were made of 17 sewage sludge samples from sewage treatment plants serving 11.9 million persons in the New York Metropolitan Region. The sludges consist of about 55 percent organic matter, which, in turn, accounts for about 55 percent of the total oxygen demand of the sludges. About 45 percent of the sludge consists of aluminosilicate material, chemically similar to shale. The samples are enriched, compared to sedimentary rocks and soils, in the following elements: silver (150x), chromium (10x), copper (50x), tin (30x), and zinc (30x). All of these elements are common industrial materials, and are known to be highly toxic to marine organisms; some are carcinogenic. Further studies are required to determine the chemical form in which they occur in the sludges and whether they are released to organisms or to seawater after dumping or deposition of the sludges. These preliminary analyses indicate the semi-quantitative spectrochemical analyses may be useful for determining order-of-magnitude concentrations of at least 24 elements commonly occurring in sewage sludges. Other techniques are required to detect other possible pollutants, with usable precision. Loss on ignition is a useful technique to use in analysis of organic matter (Volatile matter) in sewage sludges not containing large amounts of hydrous aluminosilicates. (Holoman-Battelle)

GAS-LIQUID-SOLID CHROMATOGRAPHY OF FREE ACIDS,
Rome Univ. (Italy). Istituto di Chimica Analitica.
A. Di Corcia.
Analytical Chemistry, Vol. 45, No. 3, p 492-496, March 1973. 6 fig, 1 tab, 19 ref.

Descriptors: *Organic acids, *Chemical analysis, *Pollutant identification, *Separation techniques, *Molecular structure, Selectivity, Efficiencies, Chemical properties, Aromatic compounds, Organic compounds.
Identifiers: *Gas-liquid-solid chromatography, Detection limits, Gas liquid chromatography, Chromatographic columns, 2-Methylbutyric acid, Fatty acids, 3-Methylbutyric acid, Acetic acid, Propionic acid, Isobutyric acid, Butyric acid, Trimethylacetic acid, Valeric acid, Benzoic acid, o-Toluic acid, m-Toluic acid, Salicylic acid, p-Toluic acid, o-Chlorobenzoic acid, m-Chlorobenzoic acid, p-Chlorobenzoic acid, Oleic acid, m-Hydroxybenzoic acid, p-Hydroxybenzoic acid, o-Nitrobenzoic acid, Isovaleric acid, Elaidic acid.

The use of gas-liquid-solid chromatography has been extended to the elution of free acids. The coating of the graphitized carbon black, such as graphitized Sterling FT (FT-G), by means of a suitable amount of an involatile stationary phase (FFAP) makes possible the linear elution of free acids at the nanogram level. By varying the liquid/solid ratio, gas-liquid-solid (GLS) columns have been evaluated in terms of selectivity, efficiency, and time of elution for acid compounds. On these bases, GLS columns have been compared with a GL column normally used for the analysis of acids. The results confirm that the surface of the carbon is very effective in separating molecules differing mainly in their geometric structure. In addition, GLS columns retain peak broadening also at high linear carrier gas velocities. On FT-G coated with 0.3 percent FFAP, the separation of C2-C5 fatty acids, including 2-methylbutyric and 3-methylbutyric acids, in a very dilute water solution (approximately 40 ppm) has been obtained in about 1.5 minutes. The separation of the isomers of some aromatic acids also has been performed. (Holoman-Battelle)

IRON-PHOSPHATE COMPOUND IDENTIFICATION IN SEWAGE SLUDGE RESIDUE,
Marquette Univ., Milwaukee, Wis. Coll. of Engineering.
M. A. Seitz, R. J. Riedner, S. K. Malhotra, and R. J. Kipp.
Environmental Science and Technology, Vol. 7, No. 4, p 354-357, April 1973. 1 fig, 3 tab, 6 ref.

Descriptors: *Pollutant identification, Sewage sludge, X-ray analysis, X-ray diffraction, Methodology, Separation techniques, Sewage treatment, X-rays, Pollutants.
Identifiers: *Vivianite, *X-ray powder diffraction, Sample preparation.

The iron phosphate compound, vivianite (Fe3 (Po4)2.8H20), has been identified by use of Z-ray powder diffraction techniques, as existing in the dried secondary sludge residue of the Milwaukee Jones Island sewage treatment plant. In identifying this compound, various methods of drying the sludge residue were evaluated. Magnetic separation techniques were used to concentrate and separate vivianite from the bulk of the dried material. Analysis indicated that vivianite existed in a concentration of about 1 wt percent of the dried material. (Holoman-Battelle)

DIRECT TITRIMETRIC MICRODETERMINATION OF FLUORODIFEN, LINURON, FANERON, AND PEBULATE,
Allahabad Agricultural Inst. (India). Dept. of Agronomy.
S. L. Abbas, A. K. Ghosh, S. A. I. Rizvi, and O. C. Saxena.
Journal of the Association of Official Analytical Chemists, Vol 56, No 2, p 387-389, March 1973. 1 tab.

Descriptors: *Herbicides, *Volumetric analysis, Pollutant identification, *Soil analysis, Chemical analysis, Dyes, Soil contamination, Methodology, Chemical reactions, Urea pesticides, Halogenated pesticides.
Identifiers: *Fluorodifen, *Linuron, *Faneron, *Pebulate, Chemical indicators, Chemical recovery, Bromocresol green, Catechol violet, Xylenol orange, Organic dyes, Gallium chloride, Metal complexes, Complexation, Phenylurea pesticides.

The herbicides fluorodifen, linuron, faneron, and pebulate have been determined in individual standard solutions by direct titration against gallium chloride solution, using different indicators. The same technique was applied to estimation of these herbicides in treated soils. The complex between gallium chloride and fluorodifen or linuron was formed in a 1:3 ratio, whereas the complex with faneron or pebulate was in a 1:1 ratio. Recoveries for fluorodifen, linuron, faneron, and pebulate were 99.9-101.5, 99.0-102.4, 97.1-101.3, and 98.3-101.2 percent, respectively. Treatment with herbicide lowered the pH of the soil. (Holoman-Battelle)

DRY ASHING TECHNIQUE FOR THE DETERMINATION OF ARSENIC IN MARINE FISH,
Beak (T.W.) Consultants, Ltd., Toronto (Ontario). Lab. Div.
P. J. Leblanch, and A. L. Jackson.
Journal of the Association of Official Analytical Chemists, Vol 56, No 2, p 383-386, March 1973. 6 tab, 19 ref.

Descriptors: *Colorimetry, *Marine fish, *Pollutant identification, Methodology.
Identifiers: *Arsenic, *Dry ashing, Sample preparation, Silver diethyldithiocarbamate, Chemical recovery, Precision, Detection limits.

A dry ashing procedure, followed by the silver diethyldithiocarbamate colorimetric determination of arsenic in marine fish, is presented. The sample was first homogenized and a portion pre-ashed with magnesium nitrate, using infrared heat, followed by ashing in a 500 C muffle furnace. The residue was dissolved in HCl and the arsenic reduced by means of zinc and HCl to arsine, which was complexed with AgDDC and determined colorimetrically at 535 nm. At temperatures of 460 C and above, efficient ashing was obtained. The effect of various volumes of ashing aid (50 percent magnesium nitrate) was also studied. Maximum recovery and precision were obtained when a minimum of 8 ml 50 percent magnesium nitrate was used. Standard recoveries of inorganic arsenic added to NBS orchard leaves and a sample of dry marine fish tissue gave values of 91-98 percent. Analyses of a number of standard NBS orchard leaves and marine fish As-1 and As-2 gave coefficients of variation of 7.0, 6.0, and 8.1 percent, respectively. Results from dry ashing and wet digestion of a number of species of marine fish were not comparable. Levels of arsenic found in different species of marine fish ranged from less than 0.4 to 27.0 micrograms As/g wet weight. Crabs were found to contain elevated amounts of arsenic. (Holoman-Battelle)

RAPID, SENSITIVE METHOD FOR DETERMINATION OF MERCURY IN A VARIETY OF BIOLOGICAL SAMPLES,
North Dakota State Univ. Fargo. Dept. of Animal Science.
F. D. Deitz, J. L. Sell, and D. Bristol.
Journal of the Association of Official Analytical Chemists, Vol 56, No 2, p 378-382, March 1973. 4 fig, 2 tab, 6 ref.

Descriptors: *Mercury, *Pollutant identification, *Chemical analysis, Milk, Soil analysis, Alfalfa, Heavy metals, Temperature.
Identifiers: *Biological samples, *Flameless atomic absorption spectrophotometry, Accuracy, Sample preparation, Meat, Precision, Detection limits, Wet digestion, Sensitivity.

A simple, rapid method is described for the routine determination of mercury at levels as low as 2 ng (2 ppb) in a wide variety of biological samples. Vanadium pentoxide-catalyzed wet digestion at 140 C was used for complete oxidation of organic tissue. Mercury was determined by flameless atomic absorption spectrophotometry, utilizing a syringe technique to transfer mercury-containing vapor to the absorption cell. Replicate analyses of samples on different days showed good precision and accuracy. Coefficients of variations for determinations within a days run ranged from 2 to 17 percent at mercury concentrations of 30 to 40 ppb. Results agreed very closely with those obtained by neutron activation analyses of the same samples. On a routine basis, 2 analysts can analyze 30-40 samples/day. (Holoman-Battelle)

CONTAMINATION OF SURFACES BY BACTERIAL NEUSTON,
California Univ., Berkeley. Naval Biomedical Research Lab.
L. H. Disalvo.
Limnology and Oceanography, Vol 18, No 1, p 165-168, January 1973. 2 tab, 10 ref. N00014-69-A-0200-1001.

Descriptors: *Air-water interfaces, *Sampling, Fouling, Marine bacteria, Sea water, Cultures, Water pollution effects, Aggregates, Organic matter, Population.
Identifiers: *Viable counts, *Neuston.

Primary bacterial fouling of glass both underwater and at the air-sea surface was investigated. A sampler called the MT or mousetrap device was constructed for the investigations. This device basically consisted of a plexiglass case fitted with doors which could be actuated by the springs and bars of a 9 by 18 cm rattrap. The sampling surfaces were marbles mounted on the stainless steel inside the case. When the sampler was lowered into the water, the doors were opened by shifting the sampler weight to a door control line. After a specified period of time, the doors were closed, the sampler retrieved and the marbles removed and treated to remove fouling organisms for counting. In two replicate experiments, bacteria were counted from: (a) marbles lowered and raised through the air-sea interface, (b) marbles lowered through the interface but protected by the MT device, (c) water samples obtained at the air-sea interface, and (d) water samples obtained beneath the surface. Interface water samples were collected with sterile stainless steel screens 25 sq cm, having 1-mm openings and a wire thickness of 0.4 mm. Interfacial water samples contained about one order of magnitude higher viable counts than subsurface waters, and marbles contacting the air-sea interfaces retained almost three order of magnitude more bacteria then protected marbles. There were daily fluctuations in bacteria retained. The measurements show that rapid irreversible sorption of over 1000 bacteria/cm occurred within 1-2 minutes of immersion in natural waters typically containing 1000-100,000 colonies/ml. It is suggested that the rapidity of this attachment could air in the linkage of particles near the sea surface and act as a mechanism for the formation of organic aggregates. (Little-Battelle)

DEVELOPMENT OF AN OIL/WATER POLLUTION MONITOR,
Naval Postgraduate School, Monterey, Calif.
F. K. McGrath.
Available from the National Technical Information Service as AD-747 084, $3.00 in paper copy, $0.95 in microfiche. Master's Thesis, June 1972. 35 p, 11 fig, 10 ref.

Descriptors: *Oily water, *Monitoring, *Electronic equipment, *Ultrasonics, Water analysis.
Identifiers: *Fuel oil, Bilge water, Ballast water.

Because of the simplicity, ruggedness, and state of the art, ultrasonic techniques were chosen for monitoring oil in bilge and ballast water from ships. Crystalline quartz was used to produce ultrasonic waves at 30 Mhz which were monitored for attenuation using another quartz crystal. The system was tested in the laboratory with a tank designed to circulate contaminated water past the monitor. Calibrations were made with distilled water before testing with water containing up to 500 ppm fuel oil. Results with contaminated tap water were inconclusive, but attenuation was found to vary linearly with oil concentration when the contaminant level was less than 500 ppm in distilled water. Turbulence disturbed the signals, but could probably be eliminated by filtering. Although results are preliminary, the method is potentially useful for monitoring relatively low levels of oil in water. (Little-Battelle)

REVERSE PHASE THIN LAYER CHROMATOGRAPHY OF SOME AROCLORS, HALOWAXES, AND PESTICIDES,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
D. L. Stalling, and J. N. Huckins.
Journal of the Association of Official Analytical Chemists, Vol 56, No 2, p 367-372, March 1973. 6 fig, 3 tab, 7 ref.

Descriptors: *Polychlorinated biphenyls, *Pollutant identification, *Chlorinated hydrocarbon pesticides, *Pesticide residues, Chemical analysis, Separation techniques, Aldrin, Dieldrin.
Identifiers: *Thin layer chromatography (Reverse phase), *Chlorinated naphthalenes, Aroclor 1232, Aroclor 1248, Aroclor 1254, Aroclor 1260, Halowax 1099, Holowax 1013, Halowax 1014, Solvent extraction systems, GLC-Mass spectrometry, Gas liquid chromatography, p p' DDT, p p' DDE, Chlordane, Isomers, Precision, Reproducibility, Sensitivity, Carassius auratus, Goldfish, Electron capture gas chromatography.

The components of Aroclors 1232, 1248, 1254, and 1260; Halowaxes 1099, 1013, and 1014; and several chlorinated pesticides were resolved by reverse phase thin layer chromatography (RPTLC), which permits component separation by partition between a nonpolar stationary phase and a polar mobile phase. R sub f values of resulting spots were calculated for 2 of 4 new solvent systems (mobile phases). RPTLC patterns were reproducible and characteristic of each material examined. The spots were recovered from the plates and characterized by gas-liquid chromatography (GLC) and/or GLC-mass spectrometry. In some cases, single GLC peaks of Aroclor standards were resolved into more than one component by RPTLC, whereas some RPTLC spots of Halowaxes were resolved into as many as 4 GLC peaks. The analysis of environmental residues of chlorinated compounds was facilitated by this technique. (Holoman-Battelle)

COMPARATIVE STUDIES OF THIN LAYER CHROMATOGRAPHIC SYSTEMS FOR THE SEPARATION AND IDENTIFICATION OF PHOTOALTERATION PRODUCTS OF PARATHION,
Mississippi Agricultural and Forestry Experiment Station, State College.
R. L. Joiner, and K. P. Baetcke.
Journal of the Association of Official Analytical Chemists, Vol 56, No 2, p 338-340, March 1973. 3 tab, 27 ref.

Descriptors: *Separation techniques, *Pollutant identification, Methodology, Organophosphorus pesticides, Chemical analysis, Phenolic pesticides, Insecticides, Phosphothioate pesticides, Solvent extractions.
Identifiers: Parathion, *Thin layer chromatography, *Photodecomposition, *Degradation products, Sample preparation, Infrared spectra, Infrared spectroscopy, Paraoxon, Organic solvents, Solvent extraction systems, Petroleum ether, Ethyl ether, Glacial acetic acid, Methanol, Chloroform, Ammonium hydroxide, O S-diethyl O-p-nitrophenyl phosphate, O O-diethyl S-p-nitrophenyl phosphate, O-ethyl O-O-bis (p-nitrophenyl) phosphorothioate, ethyl bis (p-nitrophenyl) phosphate, O O-diethyl O-phenyl

phosphororthioate, Diethyl phenyl phosphate, p-Nitrophenol, pAminophenol, Diethyl phosphate, Ethyl phosphate.

Twelve thin layer chromatographic systems were compared for the separation of photoalteration products of parathion. R sub f values for each component in each system are presented. Infrared spectra confirmed the identity of separated components. The following 4 systems were designated superior and gave excellent separation of the components: petroleum ether-ethyl ether-glacial acetic acid (80 plus 15 plus 5 and 50 plus 45 plus 5), methanol-chloroform-ammonium hydroxide (24 plus 75 plus 3.5), and methanol-chloroform-petroleum ether (10 plus 20 plus 70). GAS CHROMATOGRAPHIC DETERMINATION OF ETHYLENE THIOUREA RESIDUES,
Rohm and Haas Co., Bristol, Pa. Bristol Research Labs.
L. D. Haines, and I. L. Adler.
Journal of the Association of Official Analytical Chemists, Vol 56, No 2, p 333-337, March 1973. 2 fig, 1 tab, 8 ref.

Descriptors: *Pesticide residues, *Chemical analysis, *Pollutant identification, Thiocarbamate pesticides, Fungicides, Methodology, Gas chromatography, Solvent extractions, Carbamate pesticides.
Identifiers: *Flame photometric gas chromatography, *Ethylene thiourea, Sample preparation, Column chromatography, Sensitivity, Chemical recovery, Methanol, Metabolites, Organic solvents, Specificity.

Residues of ethylene thiourea on food crops were determined by extracting the sample with methanol, partially purifying the extract on an alumina column, and derivatizing the ethylene thiourea extracted with 1-bromobutane in the presence of dimethylformamide and sodium borohydride. The resulting derivative was measured by gas chromatography, using a flame photometric detector. The method is suitable for routine use and is sensitive to 0.01 ppm. (Holoman-Battelle)

RESIDUES OF MS-222 IN NORTHERN PIKE, MUSKELLUNGE, AND WALLEYE,
Bureau of Sport Fisheries and Wildlife, Warm Springs, Ga. Southeastern Fish Control Lab.
J. L. Allen, C. W. Luhning, and P. D. Harman.
Investigations in Fish Control Report No 45, July 1972. 8 p, 3 tab, 6 ref.

Descriptors: *Walleye, *Colorimetry, Pollutant identification, Freshwater fish, Pikes, Temperature, Chemical analysis.
Identifiers: *MS-222, *Northern pike, *Muskellunge, *Muscle, *Thin layer chromatography, Drugs, Esox masquinongy, Esox lucius, Stizostedion vitreum, Anesthetics, Tricane methanesulfonate, Detection limits.

Residues of MS-222 in muscle of northern pike, muskellunge, and walleye following anesthesia at selected temperatures were measured by the modified Bratton-Marshall colorimetric method (Walker and Schoettger, 1967b) and confirmed by thin-layer chromatography (Allen, Luhning, and Harman, 1970). The mean concentration of MS-222 residues at the 0-hour withdrawal interval ranged from 2.4 to 19.5 ppm. The level of MS-222 residues at 0-hour withdrawal was highest in northern pike and lowest in walleye. After 24 hours withdrawal from the anesthetic, residues were detected in only 2 of the 12 northern analyzed by thin-layer chromatography, and these two samples were shown to contain less than 2.0 ppm. (Holoman-Battelle)

ANALYSIS OF SOLUBLE BERYLLIUM BY GAS CHROMATOGRAPHY,
Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio.
M. L. Taylor, and E. L. Arnold.
Available from the National Technical Information Service as AD-753 112, $3.00 in paper copy, $0.95 in microfiche. Final Report No. AMRL-TR-71-117, August 1972. 36 p, 3 fig, 13 tab, 8 ref. Project No. 6302. Contract Nos. F33615-71-C-1008, F33615-69-C-1062.

Descriptors: *Beryllium, Aqueous solutions, Calibrations, *Gas chromatography, Radioactivity techniques, Separation techniques, Chelation.
Identifiers: *Biological samples, *Tissue, *Blood, Electron capture gas chromatography, Detection limits, Sample preparation, Chromatograms, Recovery, Rats, Liver, Spleen.

A new microanalytical method for the detection and quantitation of beryllium in aqueous samples and biological specimens has been developed. The method, based upon quantitation of chelated beryllium by gas chromatography, was employed to detect beryllium in both in vitro samples and tissues of rats given beryllium by injection. Beryllium was administered in the form of aqueous solutions of beryllium sulfate, and as litte as 10 nanograms beryllium per gram of whole blood were detected and quantitated. In vivo studies which compared gas chromatographic analyses with radiometric analyses confirmed the validity of the new microanalytical technique. Preliminary studies were conducted to determine the ability of fluorinated chelating agents to remove beryllium oxide from the lungs of rats. (Little-Battelle)

A STUDY OF THE EFFECT OF PH ON THE DETERMINATION OF ZINC BY ATOMIC ABSORPTION SPECTROPHOTOMETRY,
Geological Survey, Sacramento, Calif.
A. E. Dong.
Applied Spectroscopy, Vol 27, No 2, p 124-128, March/April 1973. 2 fig, 9 tab, 14 ref.

Descriptors: *Water analysis, *Zinc, *Hydrogen ion concentration, Potassium, Manganese, Spectrophotometry, Groundwater, Absorption, Elements (Chemical).
Identifiers: *Errors, *Atomic absorption spectrophotometry, Lithium, Chemical interference.

Errors in zinc determinations in natural water by atomic absorption spectrophotometry have been found to result from variations in pH. Consequently, a study was conducted to determine the effect of pH on the analysis of zinc. Comparative analyses were also run on lithium, potassium, and manganese. Foreign species, phosphates and silicates, were added to some of the zinc solutions to study possible chemical interferences. Results showed that lithium, potassium, and manganese absorptions were essentially unaffected by pH changes. However, results with zinc showed that zinc absorption is constant in the pH range of about 2 to 5. Between pH 5 and 10, a sharp decrease in absorption is observed. With an increase above pH 10, zinc absorption levels off to a constant value. Experimental data suggested that pH variation rather than chemical interferences is primarily responsible for the variation of absorption in zinc analysis. Several possibilities, such as sorption of zinc to container walls, zinc hydroxide formation, zinc complex formation, and zinc oxide formation in flame subsequently attacked by hydrogen atoms, have been considered in aed using a 45 percent phenol extraction procedure, was found to contain lipid A fraction to 27 percent of the LPS by weight. In the lipid A fraction, glucosamine was the only amino sugar to be present, and a high molar ratio of phosphate to amino sugar (2.5:1) was noted. Two hydroxy fatty acids, hydroxydodecanoic and hydroxymyristic, were identified among the fatty acids by gas-liquid chromatography. A role of the lipopolysaccharides in the salt requirement of marine bacteria is suggested (Little-Battelle)

ULTRASTRUCTURE OF STAPHYLOCOCCUS EPIDERMIDIS AFTER FREEZE-ETCHING AND THIN SECTIONING,
McGill Univ., Montreal (Quebec). Dept. of Microbiology.
J. E. Gilchrist, and I. W. DeVoe.
Canadian Journal of Microbiology, Vol 19, No 2, p 294-295, February 1973. 6 fig, 12 ref.

Descriptors: *Pollutant identification, Separation techniques, *Electron microscopy.
Identifiers: *Staphylococcus epidermidis, *Ultrastructure, Freeze etching, Thin sectioning.

Staphylococcus epidermidis was isolated from a gradient plate and freeze etched for examination of ultrastructure. Typical of Staphylococcus, the cell walls consisted of three layers: a dense outer layer, a rather electron translucent middle layer, and a very dense layer next to the cytoplasmic membrane. Numerous mesosomes of both the vesicular and laminar types were evident in thin sections. Single vesicular structures that appeared to be invaginations of the trilaminar cytoplasmic membrane were also observed. (Little-Battelle)

STUDIES OF THE CELL ENVELOPE OF VIBRIO PARAHAEMOLYTICUS,
Georgetown Univ., Washington, D.C. Dept. of Biology.
C. F. Deneke, and R. R. Colwell.
Canadian Journal Microbiology, Vol 19, No 2, p 241-245, February 1973. 4 fig, 1 tab, 29 ref.

Descriptors: *Separation techniques, *Marine bacteria, *Pollutant identification, Pathogenic bacteria, Gas chromatography, Foods, Cultures.
Identifiers: *Gas liquid chromatography, *Vibrio parahaemolyticus, *Fatty acids, Seafoods.

Components of the cell envelope of Vibro parahaemolyticus were investigated. Vibrio parahaemolyticus is an estuarine microorganism associated with diseases of marine and estuarine animals and seafood-borne enteritis in man. Purified lipopolysaccharide (LPS), isolated using a 45 percent phenol extraction procedure, was found to contain lipid A fraction to 27 percent of the LPS by weight. In the lipid A fraction, glucosamine was the only amino sugar to be present, and a high molar ratio of phosphate to amino sugar (2.5:1) was noted. Two hydroxy fatty acids, hydroxydodecanoic and hydroxymyristic, were identified among the fatty acids by gas-liquid chromatography. A role of the lipopolysaccharides in the salt requirement of marine bacteria is suggested. (Little-Batelle)

Identifiers: *Fatty acids, Lactic acid, Pyruvic acid, Succinic acid, Sample preparation, Lactobacillus acidophilus, Bifidobacterium eriksonii, Eubacterium limosum, Chromatograms, Glucose broth.

UNIVERSITY OF ILLINOIS URBANA CHAMPAIGN

A rapid and simple procedure is described for analysis of fermentation products from anaerobic bacteria grown in glucose broth. A 1-ml sample of the culture is drained through cation-exchange resin in a Pasteur pipette. The effluent fluid is directly analyzed isothermally in a gas chromatograph for volatile fatty acids (C2 to C6) as well as for lactic, pyruvic, and succinic acids. This procedure is considered to be suitable for routine use in clinical bacteriology. (Little-Battelle)

THE P-VALUE APPROACH TO QUANTITATIVE LIQUID-LIQUID EXTRACTION OF PESTICIDES AND HERBICIDES FROM WATER. 2. SELECTION OF WATER: SOLVENT RATIOS AND NUMBER OF EXTRACTIONS,
Drexel Univ., Philadelphia, Pa. Environmental Studies Inst.
L. H. Suffet.
Journal of Agricultural and Food Chemistry, Vol 21, No 2, p 288-294, March/April 1973. 1 fig, 6 tab, 26 ref. EPA Project 16020FYT. Grant No 801179.

Descriptors: Water, *Solvent extractions, *2 4-D, Separation techniques, Herbicides, Computer programs, Solvents.
Identifiers: *Water-solvent ratios, *Chemical recovery, Sample preparation, Liquid-liquid extraction, Benzene, Hexane, Ethyl ether, Ethyl acetate, Chloroform.

Equations are developed from liquid-liquid extraction theory for the number of extractions and water: solvent ratios for maximum recovery for typical p-values (P-value is defined as the fraction of the total solute that distributes itself in the nonpolar phase of an equivolume solvent pair). A computer program analysis of the equations developed indicates that a pesticide which has a p-value greater than or equal to 0.90 in an aqueous solvent system can be extracted from the aqueous phase with 95 percent recovery in no more than 5 successive extractions of at least 50 ml with a total volume of more than 500 ml of solvent. The equations were successfully tested with serial extraction of 2, 4-D by separatory funnel and vortex stirring extraction procedures. The contribution to the total error of initial LLE step was estimated to be less than 20 percent for a four-step serial extraction. (Little-Battelle)

Identifiers: *Environmental samples, *Biological samples, *Multielemental analysis, Chemical composition, Sensitivity, Detection limits, Blood, Liver, Hemoglobin, Lithium-drifted silicon detector, Brain, Swordfish, Hair, Sample preparation.

The potential for the simultaneous analysis of samples for traces of all elements with an atomic number (Z) greater than or equal to 15 by x-ray fluorescence using 2.5-MeV protons is described along with the advantages and limitations of the technique. Only miligram quantities of material are required and the sensitivity changes quite slowly and smoothly from element to element in contrast to the method of neutron activation. The technique is nondestructive and a minimum or no work in sample preparation is required. The sample must be thin and reasonably uniform. For maximum sensitivity, the sample must be either self-supporting or mounted on a very thin backing. Samples are generally placed in a high vacuum for irradiation although the potential exists to irradiate samples outside the vacuum by passing the beam through a thin window. This technique has been applied to a variety of environmental and biological materials, including air pollution, sediment, plankto, perch blood and liver enzyme, and hemoglobin. For samples of 0.1 mg/sq cm in thickness, sensitivities as small as 0.1 ppm can be expected. (Holoman-Battelle)

A RAPID, INEXPENSIVE COULOMETRIC DETERMINATION OF SULPHUR IN PETROLEUM PRODUCTS,
Laporte Industries Ltd., Widnes (England).
J. M. Carter.
Analyst, Vol 97, No 1161, p 929-936, December 1972. 5 fig, 3 tab, 5 ref.

Descriptors: *Sulfur, *Oil, Laboratory equipment.
Identifiers: Recovery, *Detection limits, *Sample preparation, Precision, *Coulometric titration, Sensitivity, Oil characterization.

A method has been developed for determining sulfur in oil using a combustion chamber and measuring with a coulometric cell the quantity of sulfur dioxide produced. The coulometer used was a Thorn T.E. 110, and the combusion chamber was a modified Gallenkamp C and H microfurnace. With the setup described, it was possible to determine sulfur in oils in the range of 0.01 to 1.0 percent m/m. The advantages of the method are: Samples can be analyzed in triplicate in 5 minutes; a low degree of operator skill is required to operate the equipment; the method has good precision (coefficient of variation of the mean is 1.4 percent); the method should be usable for determining nitrogen in oil; small samples (0.5 microliter) are used; and the cost of the set up is low (600 pounds). (Little-Battelle)
W73-10510

MODIFICATION OF AN ISCO DRUM FRACTION COLLECTOR TO PERMIT USE OF STOPPERED TEST TUBES,
Rockefeller Univ., New York.
M. P. Printz, R. K. Franz, and N. A. Jernberg.
Analytical Biochemistry, Vol 51, No 2, p 482-485, February 1973. 2 fig, 2 ref.

Descriptors: *Chromatography, Laboratory equipment, Design.
Identifiers: *Fraction collector.

An Isco Fraction Collector has been modified to permit use of stoppered test tubes for collection of column effluents. This unit was developed for and serves a critical function as part of the system used for automated tritium-hydrogen exchange measurements. The primary need for a stoppered test tube fraction collector was (1) to reduce evaporation from 300-microliter column fractions obtained during overnight experiments, and (2) to prevent radioactive cross contamination. However, such a stoppered system should also be valuable for other applications, such as for minimizing evaporation of volatile organic solvents used in either lipid or partition chromatography. (Little-Battelle)

A NEW, SENSITIVE METHOD FOR THE DETERMINATION OF STREPTOMYCIN,
Magyar Tudomanyos Akademia, Szeged. Inst. of Biochemistry.
E. Duda.
Analytical Biochemistry, Vol 51, No 2, p 651-653, February 1973. 2 fig, 6 ref.

Descriptors: *Antibiotics (Pesticides), *Methodology, *Assay, *Spectrophotometry, *Pollutant identification, *Aqueous solutions, Chemical analysis, Chemical reactions, Biochemistry.
Identifiers: *Streptomycin, Thiobarbituric acid, Absorbance, Reproducibility, Sensitivity, Absorption spectra, N-acetyl glucosamine, Streptidine, 2-deoxy-D-glucose.

In order to avoid the difficulties involved in most chemical methods for the determination of streptomycin, a new assay method based on the periodate-thiobarbituric acid method has been developed. This method uses the observation that the reaction product of streptomycin gives a sharp absorption maximum at 415. This maximum is absent from spectra of other compounds tested - including deoxy sugars, streptidine, N-acetyl-glucosamine. A quantity of the streptomycin solution was mixed with potassium metaperiodate in 1 N H_2SO_4. The mixture was incubated for 15 min at 37 degrees; 2 percent $NaAsO_2$ in 0.5 N HCl was added with shaking; and a 0.3 percent thiobarbituric acid reagent was added after the brownish color disappeared. This mixture was placed in a waterbath for 10 min and the absorbance was measured at 45 nm. The method described gives reproducible results; its sensitivity is equal or better than the sensitivity of other chemical streptomycin assays (the color is stable at least for an hour), and its higher specificity allows its use in cases in which the former methods are not applicable. (Holoman-Battelle)

THE ATOMIC ABSORPTION DETERMINATION OF ZINC WITH A GRAPHITE FURNACE,
Imperial Coll. of Science and Technology, London (England). Dept. of Chemistry.
D. Clark, R. M. Dagnall, and T. S. West.
Analytica Chimica Acta, Vol 63, No 1, p 11-18, January 1973. 4 fig, 3 tab, 5 ref.

Descriptors: *Zinc, *Aqueous solutions, *Pollutant identification, Heavy metals, Chemical analysis, Anions, Cations, Alkali metals, Solvent extractions, Temperature, Silicates, Sulfates, Chlorides, Nitrates, Sodium, Phosphates, Potassium, Copper, Nickel, Aluminum, Cobalt.
Identifiers: *Ionic interference, *Atomic absorption spectrophotometry, *Solvent extraction systems, *Heated graphite furnace, Detection limits, Chemical concentration, Chemical interference, Organic solvents, Acetates, Barium, Tin, Antimony.

The use of a heated graphite furnace has been evaluated for the atomic absorption determination of zinc. Interference and the use of solvent extraction to overcome such have been investigated. Five-microliter aliquots were applied to different

points along the furnace. The peak height obtained by heating at lower temperatures varied with the sample position, heating at a higher temperature yielded rather constant peak heights. All the ions tested caused interference when present in large amounts. Many of the interferences can be successfully avoided by using most of the solvent extraction systems. Results of the study of solvent extraction for the elimination of interference show that organic solvents cause no problems with the graphite furnace; no surface tension, viscosity, density or enhanced 'nebulizer' effects were noted. The detection limit obtained with aqueous solutions can be lowered by preconcentration in the solvent extraction step, the limiting factor being reagent in solvent blanks. Determinations of zinc were made in the 0.002-1 ppm range. (Holoman-Battelle)
W73-10515

USE OF A BOD OXYGEN PROBE FOR ESTIMATING PRIMARY PRODUCTIVITY,
Wyoming Univ., Laramie. Dept. of Zoology and Physiology.

Limnology and Oceanography, Vol 18, No 1, p 152-154, January 1973. 1 fig, 1 tab, 4 ref.

Descriptors: *Primary productivity, *On-site data collections, *Dissolved oxygen, *Measurement, *On-site tests, Water sampling, Biochemical oxygen demand, On-site investigations, Methodology, Instrumentation.
Identifiers: *BOD oxygen probe, *Photosynthetic rates, Dissolved organic carbon, Analysis of variance, Data interpretation, Van Dorn sampler, Experimental error, Sample preparation, Accuracy, Winkler method.

The accuracy of a BOD oxygen probe for field measurements of primary production by the light and dark bottle oxygen technique has been analyzed. Water samples were taken from various depths with a Van Dorn sampler and subsamples placed in light and dark BOD bottles. DO was measured in each bottle before and after a 6-hr in situ incubation. A single water sample was used to measure DOC and to calibrate the oxygen probe. Preparation time at the beginning of each experiment was 1.4 min per bottle, and the time required to measure DOC at the end of each incubation was 0.6 min per bottle. The light bottle change in DOC for seven photosynthesis vs. depth experiments ranged from minus 0.40 to plus 0.90 ppm and the dark bottle change plus 0.05 to minus 0.70 ppm. The ambient DOC was 7-10 ppm. Variability was reduced by pairing the 2 readings from each bottle; a one-way ANOVA was used to estimate experimental error. A figure is presented with which to estimate the number of replicate bottles needed to obtain a given accuracy in estimating photosynthetic rates. The BOD oxygen probe was shown to be a rapid, convenient instrument when used to estimate primary production, and its accuracy in certain cases may be comparable to that of the Winkler method. (Holoman-Battelle)

ON THE STORAGE OF SEAWATER SAMPLES FOR AMMONIA DETERMINATION,
Institut Rudjer Boskovic, Rovinj (Yugoslavia). Center for Marine Research.
D Degobbis.
Limnology and Oceanography, Vol 18, No 1, p 146-150, January 1973. 5 fig, 13 ref.

Descriptors: Storage, *Ammonia, Filtration, *Freezing, *Seawater, Water analysis, Chemical analysis, *California.
Identifiers: *Sample preservation, Sample containers, Sample preparation, Glass bottles, Polyethylene bottles, *Monterey Bay (Calif).

In order to clarify conflicting results concerning the effect of storage on ammonia concentration, a study was initiated to investigate the effects of various storage parameters. Seawater samples were collected from Monterey Bay, California. Portions of the samples were analyzed immediately in shipboard laboratories. The remaining portions were stored in glass or polyethylene containers; filtered or unfiltered; slow frozen or quick frozen and with or without added preservatives. After various periods of time up to 20 days, samples were thawed, analyzed by the phenol-hypochlorite method, and the results compared with those from the unstored samples. The results showed significant changes in samples stored without treatment. Ammonia increased when stored in glass, but decreased when stored in polyethylene containers. Quick freezing and slow freezing stabilized ammonia concentrations, although variability was increased; quick freezing had no advantage over slow freezing. Preservation with phenol at the same concentration used in the analytical method (0.4 g 100 per ml) stabilized unfrozen samples for up to 2 weeks. (Little-Battelle)

CHARACTERISTICS OF THE NEARSHORE ENVIRONMENT OFF THE SOUTH COAST OF ANVERS ISLAND, ANTARCTIC PENINSULA,
California State Univ., Hayward. Dept. of Earth Sciences.
D. A. Warnke, J. Richter, and C. H. Oppenheimer.
Limnology and Oceanography, Vol 18, No 1, p 131-142, January 1973. 4 fig, 5 tab, 40 ref.

Descriptors: *Sediments, Distribution patterns, *Nutrients, *Sea water, *Connate water, *Bacteria, Water quality, Sedimentation, Organic matter, Oxidation-reduction potential, Hydrogen ion concentration, Silica, Water analysis, *Antarctic, Nitrites, Nitrates, Cycling nutrients, Sampling, Cultures, Carbon, Silicates, Phosphates, Volumetric analysis, Population, Primary productivity, Chemical analysis.
Identifiers: *Culture media, Agars, Texture.

A study was carried out in Arthur Harbor and vicinity, Antarctic Peninsula, in February and March 1967, to establish the characteristics of bottom sediments and the overlying water column, to determine the bacterial numbers in water and sediment samples, to relate these quantitiies to several environmental parameters, and to determine which, if any, of them act as determinants of bacterial distribution. In addition, the possibility of bacterial liberation of nutrients from the surrounding rock outcrops, and their addition to the nearshore nutrient budget, were investigated. The sediments are diamictons and display great lateral variability. Their organic carbon content falls within the range of values for oceanic sediments. Silica concentrations in the interstitial water of these sediments seems to be controlled by biogenic processes of sedimentation. Bacteria are preferentially associated with sediments rich in clay-sized materials and show little or no correlation with organic carbon in these samples; the surface properties of the fine sediment may be important. Bacterial numbers in the water column are similar to those reported for open-ocean areas below 200 m in lower latitudes. Nutrient values are high, but many nitrite values are low relative to nitrate as in lower latitudes before the growth season and in the open ocean below the euphotic zone. These similarities may indicate that primary productivity at the time and place of investigation was low. (Little-Battelle)

THE EXTRACTION OF THE CHROMIUM (III)--EDTA COMPLEX BY SOLUTIONS OF ALIQUAT-336 IN VARIOUS ORGANIC SOLVENTS,
Leeds Univ. (England). Dept. of Inorganic and Structural Chemistry.
H. M. N. H. Irving, and R. H. Al-Jarrah.
Analytica Chimica Acta, Vol 63, No 1, p 79-84, January 1973. 2 fig, 2 tab, 14 ref.

Descriptors: *Chromium, *Aqueous solutions, Separation techniques, Anion exchange, Trace elements, Methodology, Solvent extractions, Chemical analysis, Chelation, Heavy metals.
Identifiers: *Organic solvents, *EDTA, *Metal chelates, *Ion exchange resins, Aliquat-336-Cl, Sample preparation, Amyl alcohol, Chloroform, 1 2-Dichloroethane, Hexone, Carbon tetrachloride, Methyl isobutyl ketone, Benzene, Nitrobenzene, p-Xylene, Hexane.

The percentage of chromium (III) extracted as the complex anion CrY (H2O) from solutions containing a 10 percent excess of EDTA (H4Y) by the liquid anion-exchanger Aliquat-336-Cl is shown to increase with change of organic solvent ('diluent') in the order amyl alcohol less than chloroform less than 1,2-dichloroethane less than hexone less than carbon tetrachloride less than benzene less than nitrobenzene less than p-xylene less than hexane. With mixtures of p-xylene and chloroform there is a minimum at 0.4 mole fraction of xylene. The order of solvents can best be correlated with their solubility parameters. With hexane the organic phase separates into two layers of which the one of larger volume (80 percent of total) contains very little extracted ion-pairs. The enhanced concentration of chromium (III) in the organic phase of smaller volume can be exploited analytically. (Holoman-Battelle)

THE DIRECT DETERMINATION OF CHROMIUM IN URINE BY SELECTIVE VOLATILIZATION WITH ATOM RESERVOIR ATOMIC ABSORPTION,
Environmental Protection Agency, Perrine, Fla. Perrine Primate Lab.
R. T. Ross, J. G. Gonzalez, and D. A. Segar.
Analytica Chimica Acta, Vol 63, No 1, p 205-209, January 1973. 1 fig, 1 tab, 24 ref.

Descriptors: *Trace elements, *Chromium, *Methodology, Chemical analysis, Heavy metals, Pollutant identification.
Identifiers: *Heated graphite atomizer, *Urine, *Atom reservoir atomic absorption spectrophotometry, Sample preparation, Accuracy, Precision, Biological samples, Detection limits, Chemical digestion, Atomic absorption spectrophotometry.

Samples of urine were analyzed by the atom reservoir atomic absorption technique for the presence of chromium before and after digestion. The samples were digested by adding 1 ml of nitric acid to 1 ml of urine in teflon vials. The vials were tightly closed to prevent leaks and were placed in an 80 degree oven for 1 and 24 h. After heating, the samples were cooled to room temperature, and then 20 microliters were removed by means of an Eppendorf pipette and injected into the heated graphite atomizer. The relative standard deviation for peak signals calculated from twenty injections of 20-microliter aliquots of urine containing 20 ppb of chromium was 2 percent. For aqueous solutions of

UNIVERSITY OF ILLINOIS URBANA CHAMPAIGN

the same concentrations the relative standard deviation was 10 percent. These data are in close agreement with the reproducibilities cited in the literature. The detection limit obtained for chromium was 2.5 ppb for 20-microliter urine samples. Injections of up to 100 microliters are possible with this technique, and such injections could increase the sensitivity of the method. The ease of application and shortness of analysis time of this technique promise further applicability toward trace metal analyses in other biological materials. (Holoman-Battelle)
W73-10525

DIRECT MEASUREMENT OF LESS THAN 1 PART-PER-BILLION FLUORIDE IN RAIN, FOG, AND AEROSOLS WITH AN ION-SELECTIVE ELECTRODE,
Naval Research Lab., Washington, D.C.
T. B. Warner, and D. J. Bressan.
Analytica Chimica Acta, Vol 63, No 1, p 165-173, January 1973. 1 fig, 3 tab, 21 ref.

Descriptors: *Fluorides, *Rain, *Fog, *Aerosols, *Snow, Pollutant identification.
Identifiers: *Ion selective electrodes, Detection limits, Sample preparation, Response time, Accuracy.

Soluble fluoride in rain, snow, fog or aerosols can be determined directly in samples containing down to 0.28 ppb by an inexperienced analyst after brief training with a lanthanum fluoride electrode. The method involves little sample handling, 10-ml samples suffice, a determination takes 15-22 min and the technique can be extended over 8 decades of concentrations. Probable uncertainty ranges from 10-20 percent near 0.28 ppb to 3-6 percent above 100 ppb. The general technique compares the rate of change of potential in the unknown with that in nearby standards, and should be useful for trace determinations with other ion-selective electrodes as well. One possible application is the direct determination of other halides in rain. There does not seem to be any intrinsic reason why more dilute samples could not be handled if suitable standards could be prepared. (Little-Battelle)
W73-10526

THE INDIRECT SPECTROPHOTOMETRIC DETERMINATION OF THE SULPHATE ION WITH 2-AMINOPERIMIDINE,
Birmingham Univ. (England). Dept. of Chemistry.
P. A. Jones, and W. I. Stephen.
Analytica Chimica Acta, Vol 64, No 1, p 85-92, March 1973. 2 fig, 2 tab, 11 ref.

Descriptors: *Spectrophotometry, *Sulfates, Methodology, *Surface waters, *Rain, *Aqueous solutions, Anions, Cations, Chemical reactions, Calibrations, Phosphates, Fluorides, Nitrates, Chemical precipitation, Chemical analysis, Pollutant identification.
Identifiers: 2-Aminoperimidine, Sensitivity, Chemical interference, Accuracy, Absorbance.

A new spectrophotometric determination of the sulphate ion is described which uses 2-aminoperimidine hydrochloride as a precipitating reagent. The excess of the reagent is measured at 305 nm. The procedure deals with sulphate in the range 4-120 ppm, and relies on simple calibration. The relative standard deviation for 50 ppm of sulphate is 3.7 percent. The interference of 100 ppm of phosphate, fluoride and nitrate is only slight in the determination of 50 ppm of sulphate. The method is recommended for the determination of sulphate in rain and surface waters. (Holoman-Battelle)
W73-10527

THE DETERMINATION OF MANGANESE IN URINE BY ATOMIC ABSORPTION SPECTROMETRY,
Maryland Univ., College Park. Dept. of Chemistry.
D. G. Van Ormer, and W. C. Purdy.
Analytica Chimica Acta, Vol 64, No 1, p 93-105, March 1973. 3 fig, 5 tab, 32 ref.

Descriptors: *Manganese, *Chemical analysis, *Methodology, Solvent extractions, Stability, Hydrogen ion concentration, Efficiencies, Copper, Molybdenum, Iron, Mercury, Lead, Cadmium, Chelation, Heavy metals, Cations, Pollutant identification.
Identifiers: *Atomic absorption spectrophotometry, *Urine, Metal chelates, Biological samples, Sample preparation, Preconcentration, Chemical interference, Ionic interference, Bismuth, Antimony chloride, Thallium chloride, Tin chloride, Methyl isobutyl ketone, Organic solvents.

An atomic absorption procedure was developed for the determination of urine manganese. Urine samples were digested with a mixture of nitric, sulfuric, and perchloric acids containing molybdate as catalyst. This wet digestion was followed by cupferron extraction into methyl isobutyl ketone to yield stable extracts of urine Mn at concentration levels quantifiable by atomic absorption spectrometry. A two-point standard addition technique was used and involved extracts of buffered, digested aliquots containing 10 and 20 ppb Mn (II) in the aqueous phase. Of the substances tested for extraction interference, only bismuth, antimony, and thallium were found to interfere. (Holoman-Battelle)
W73-10528

THE FLUORIMETRIC DETERMINATION OF PHOSPHATE WITH THIAMINE,
Dalhousie Univ., Halifax (Nova Scotia). Trace Analysis Research Centre.
J. Holzbecher, and D. E. Ryan.
Analytica Chimica Acta, Vol 64, No 1, p 147-150, March 1973. 1 fig, 4 ref.

Descriptors: *Fluorometry, *Phosphates, *Pollutant identification, *Chemical analysis, Aqueous solutions, Methodology, Chemical reactions, Anions, Cations, Heavy metals, Alkaline earth metals, Molybdenum, Nitrates, Chlorides, Bromides, Fluorides, Iodides, Silicates, Sulfides, Nickel, Manganese, Cadmium, Copper, Cobalt, Calcium, Zinc, Aluminum, Iron, Mercury, Hydrogen ion concentration.
Identifiers: *Trace levels, *Thiamine, Chemical indicators, Detection limits, Accuracy, Ionic interference, Acetates, Perchlorates, Thiocyanates, Tartrates, Citrates, EDTA, Persulfates, Hexacyanoferrates, Chemical concentration, Chemical interference.

Phosphate may be determined down to the one ppb level by a fluorimetric method which involves converting the phosphate to hexadimolybdatophosphate by adding ammonium molybdate to an acidified phosphate solution. The hexadimolybdatophosphate is then reacted with nonfluorescent thiamine to produce the highly fluorescent thiochrome, the fluorescence intensity of which is measured at 375 nm. The standard deviation of seven determinations of 50 ppb of phosphate was 3 percent; for 5 ppb the deviation was less than 10 percent. Fifty ppb of phosphate was successfully determined in the presence of a 10,000-fold molar amount of acetate, chloride, nitrate, perchlorate or thiocyanate, or a 1,000-fold amount of bromide, fluoride, or tartrate. Results were also satisfactory with a 100-fold amount of citrate, EDTA, iodide or persulphate. A 10-fold amount of silicate or hexacyanoferrate (III) could be presented but larger amounts increased the fluorescence intensity; an equivalent amount of sulphide strongly quenched the fluorescence. A 10,000-fold molar amount of Ni (II), Mn (II), or Cd (II), and a 1,000-fold amount of Cu (II), Co (II), Ca (II), Zn (II), Al (III) did not interfere. A 10-fold amount of iron (III) and an equivalent amount of iron (II) could be present, but an order of magnitude increase in concentration decreased the fluorescence. Mercury (II) and mercury (I) markedly increased the fluorescence even at equimolar ratios. Important factors in the determination of phosphate with thiamine are the starting acidity, the thiamine concentration, the molybdenum concentration and the final pH. (Holoman-Battelle)

THE DETERMINATION OF TOTAL NITROGEN IN PLANT MATERIALS WITH AN AUTOMATIC NITROGEN ANALYSER,
International Atomic Energy Agency, Seibersdorf (Austria).
R. Fiedler, G. Proksch, and A. Koepf.
Analytica Chimica Acta, Vol 63, No 2, p 435-443, February 1973. 3 fig, 3 tab, 3 ref.

Descriptors: *Nitrogen, *Chemical analysis, *Plant tissues, *Laboratory equipment, Methodology, *Nitrogen compounds, Grasses, Wheat, Barley, Research equipment, Rice, Organic compounds, Inorganic compounds, Regression analysis, Automatic control, Agronomic crops, Cereal crops, Pollutant identification.
Identifiers: *Automatic nitrogen analyzer, Kjeldahl procedure, Reproducibility, Accuracy, Biological materials, Ammonium sulfate, Ammonium nitrate, Glutamic acid, Acetanilide, Ammonium pyrrollidine dithiocarbamate, Potassium nitrate.

A description is given of an automatic analyzer which has been used for the measurement of total nitrogen in chemical compounds and botanical material after the combustion method of Dumas in vacuum. Several chemical compounds and plant materials were analyzed using the nitrogen analyzer. The analysis of chemicals by means of the nitrogen analyzer yielded excellent results which entirely agree with the theoretical nitrogen content of the samples. The standard deviation of a single determination was of the order of 1 percent or less, of the nitrogen content of the sample. In the analysis of plant materials, the values obtained with the N analyzer tended to be slightly higher than those obtained by the Kjeldahl procedure. The standard deviation of the single nitrogen analyzer values was of the order of 1-4 percent of the mean nitrogen content of the samples, and relatively higher for wheat, barely and rice grain. Statistical evaluation of all analytical results showed that the comparative reproducibility and accuracy of the automatic analyzer and the Kjeldahl method were very good. (Holoman-Battelle)

ATOMIC FLUORESCENCE CHARACTERISTICS OF COPPER IN VARIOUS PREMIXED FLAMES,
Technical Univ. of Prague (Czechoslovakia). Lab. of Flame Spectrometry.
D. Kolihova, and V. Sychra.
Analytica Chimica Acta, Vol 63, No 2, p 479-482, February 1973. 2 fig, 3 tab, 20 ref.

Descriptors: *Copper, *Physical properties, *Chemical analysis, *Aqueous solutions, Cations, Anions, Heavy metals, Pollutant identification.
Identifiers: *Atomic fluorescence spectroscopy, Characterization, Atomic fluorescence spectra, Detection limits, Ionic interference, Chemical interference, Sensitivity.

The atomic fluorescence of copper revealed that its spectrum consists of 9 resonance lines instead of the previously reported two. Analytical curves of the resonance fluorescence lines measured in

the premixed oxygen-argon-hydrogen flame are linear over 4 decades of concentration: from the limit of detection up to a concentration of about 15 micrograms/ml. Detection limits for all the copper lines in the 3 flames studied are tabulated. Interferences from solute volatilization and spectral interferences were found to be insignificant for 1000-fold (by weight) amounts of 28 common cations and anions in the premixed air-hydrogen and shielded air-acetylene flames. The absence of interferences and the high sensitivity of the atomic fluorescence method allowed a rapid direct determination of copper in blood serum to be made after 25-fold dilution of serum with twice-distilled water. Virginia Univ., Charlottesville,
J. F. Ryan.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor Mich., 48106, Order No. 72-33,382. Ph D Dissertation, 1972. 129 p.

Descriptors: *Organic compounds, *Chemical reactions, *Methodology, *Pollutant identification, Mass spectrometry, Alcohols, Organic acids, Ionization, Chemical analysis, Ethers.
Identifiers: *Chemical ionization mass spectrometry, CI mass spectra, Aldehydes, Ketones, Esters, Reagents, Mass spectra, CI spectra, Chemical structure, Functional groups.

Chemical ionization mass spectrometry (CIMS) was used to distinguish between acids, aldehydes, esters, ethers, and ketones, as well as between primary, secondary, and tertiary alcohols. Two methods were used to identify functional groups present in a sample molecule. The first was based on a determination of the sample's proton affinity relative to that of the source gas. The second method was based on the unique set of ions produced by each functional group in CI spectra using nitric oxide as a source gas. Argon-water source-gas mixtures were used to produce high and low resolution mass spectra which exhibit ions characteristic of both electron impact and chemical inoization methods of ionization. Mass spectra of different functional groups were obtained using trimethylsilyl cation as an ionization reagent. Peaks due to electrophilic attachment were observed in all cases. Finally negative ion chemical ionization mass spectra were recorded using oxygen as a reagent gas. (Holoman-Battelle)

METHOD FOR HIGH-SPEED LIQUID CHROMATOGRAPHIC ANALYSIS OF BENOMYL AND/OR METABOLITE RESIDUES IN COW MILK, URINE, FECES, AND TISSUES,
Du Pont de Nemours (E. I.) and Co., Wilmington, Del. Industrial and Biochemicals Dept.
J. J. Kirkland.
Journal of Agricultural and Food Chemistry, Vol 21, No 2, p 171-177, March/April 1973. 4 fig, 7 tab, 17 ref.

Descriptors: *Pesticide residues, *Fumigants, *Carbamate pesticides, Milk, Cattle, Pollutant identification, Chemical analysis, Chlorinated hydrocarbon pesticides, Urea pesticides, Organophosphorus pesticides, Phenolic pesticides, Solvent extractions, Separation techniques, Monuron, DDT, Herbicides, Insecticides, Dalapon, Heptachlor, Phosphothioate pesticides, Phenols, Chemical degradation.
Identifiers: *Benomyl, *Biological samples, *High-speed liquid chromatography, *Metabolites, Tissues, Urine, Feces, Chemical recovery, Chemical interference, Sample preparation, Cation exchange liquid chromatography, Detection limits, Benzimidazolecarbamate, Liver, Methomyl, Thiabendazole, Dicamba, Lasso, 2 6-Diethylaniline, Ethion, Strobane, Malathion, Simazine, Tetradifon, Methoxychlor, Chloroneb, Ronnel, Guthion, N-Isopropylaniline, Diphenyl amine, Atrazine, Sevin, Diuron, Linuron, Methyl parathion, Ramrod, Absorbancé, Kidneys, Fat tissue, Muscle, Ultraviolet photometric detector.

Residues of benomyl (methyl 1- (butylcarbamoyl)-2-benzimidazolecarbamate) and/or methyl 2-benzimidazolecarbamate, methyl 5-hydroxy-2-benzimidazolecarbamate, and methyl 4-hydroxy-2-benzimidazolecarbamate may be simultaneously determined in cow milk, tissues, urine, and feces. The first step in the method consists of hydrolyzing the sample in aqueous acid to convert benomyl to methyl 2-benzimidazolecarbamate and to free the metabolites from conjugates. The freed materials are then extracted into an organic solvent, the extract is cleaned up by a solvent-solvent, partitioning process, and the components are determined in a single scan by high-speed strong cation exchange liquid chromatography. Recoveries of the various components average about 80 percent in cow milk and urine, with average recoveries of about 50-80 percent obtained from tissue samples and feces. Recoveries for the various compounds have been demonstrated at the 0.01-0.02-ppm level in cow milk, at the 0.05-0.1-ppm level in tissues and feces, and at the 0.2-ppm level in urine. No interference with the method was found from a number of other pesticides with tolerances in milk and meat tissues. (Holoman-Battelle)

HALOGENATED COMPOUNDS FOR THE SENSITIVE DETECTION OF CLOSTRIDIA BY GAS CHROMATOGRAPHY,
Yale Univ., New Haven, Conn. Div. of Health Science Resources.
B. M. Mitruka, and M. Alexander.
Canadian Journal of Microbiology, Vol 18, No 10, p 1519-1523, October 1972. 4 tab, 9 ref.

Descriptors: *Pollutant identification, *Anaerobic bacteria, *Clostridium, Alcohols, Organic acids, 2 4-D, 2 4 5-T, *Gas chromatography.
Identifiers: *Electron capture gas chromatography, *Cometabolism, Sensitivity, Substrates, Sample preparation, Metabolites, Culture media, Clostridium species, Chlorophenols, Methylphenoxyacetates, Hydrocarbons, Acetoin, n-Butanol, Isobutanol, Methanol, Valeric acid, Propionic acid, Isobutyric acid, Crotonic acids, Isopentanol, Diacetyl, Isovaleric acid, Acrylic acid, Pentanol, Butanediol.

Metabolites formed by the equivalent of 230 to 3000 cells of several Clostridium species were detected by use of a gas chromatograph fitted with an electron capture detector. A variety of organic acids, alcohols, and ketones were produced by growing cultures of the 10 species tested. Compounds excreted by 300 to 3000 cells of 12 strains of Clostridium perfringens were detected, and both common and dissimilar metabolites were formed by these strains. The sensitivity for detecting six Clostridium species increased up to several thousandfold when chlorophenoxyacetates were added to the medium, the increase being most marked with 2,4-di- and 2,4,5-trichlorophenoxyacetates. The results show that cometabolism is useful in increasing the sensitivity and speed of detection of Clostridium species. (Holoman-Battelle)

A STUDY TO IMPROVE DISSOLVED OXYGEN ANALYSIS TECHNIQUES TO FACILITATE WATER QUALITY FIELD SURVEY APPLICATIONS,
Arkansas Univ., Little Rock. Dept. of Electronics and Instrumentation.
R. W. Raible, and M. K. Testerman.
Available from National Technical Information Service as PB-221 019, $3.00 in paper copy, $0.95 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Publication No 13, June 1973, 71 p, 22 fig, 22 tab, 4 ref. OWRR A-017-ARK (1). 14-31-0001-3804.

Descriptors: *Dissolved oxygen analyzers, *Dissolved oxygen, *Electrodes, *Instrumentation, Water quality, Water temperature, Pollutant identification.
Identifiers: Oxygen sensor, *Temperature compensated electrode.

Studies were made of the temperature characteristics of dissolved oxygen electrodes having a large surface area. Large area electrodes proved to have much longer lifetime between rejuvenations. Many measurements of dissolved oxygen in water need to be made in field situations where recalibration techniques would be difficult and where making temperature corrections is time consuming for operators who may be making numerous measurements. This study was directed toward design of a compensation circuit for a dissolved oxygen electrode which will give the best possible measurement over a large water temperature range of 5C - 35C without the necessity of recalibration. Studies were made of the temperature characteristics of dissolved oxygen probes and several electronic circuits with different configurations and components are described. Experimental data using two of the circuits are resported. One method involved using an integrated circuit multiplier module. The best temperature compensation was obtained for a circuit based on a design in which two thermistors were incorporated. (Roberson-Arkansas)

A NETWORK FOR CONTINUOUS MONITORING OF WATER QUALITY IN THE SABINE RIVER BASIN, TEXAS AND LOUISIANA,
Geological Survey, Austin, Tex.
J. F. Blakey, and P. W. Skinner.
Geological Survey open-file report, May 1973. 37 p, 1 fig, 3 tab, 3 ref.

Descriptors: *Water quality, *Remote sensing, *Networks, *Monitoring, River basins, Texas, Louisiana, Data collections, Data transmissions, Control systems, Planning, Chemical analysis, Telemetry, Remote control, Network design, Methodology, Streamflow, Water temperature.
Identifiers: *Sabine River basin (Tex and La).

The proposed water-quality network for the Sabine River basin of Texas and Louisiana consists of nine monitoring stations, a central-control station, a slave-central station, and a leased-line telecommunications system. This monitoring network would provide continuous transmission of water-quality data to the office of the water manager. Level I operations at a proposed site would monitor current and potential problems, water-quality changes in subreaches of streams, and water-quality trends in time and place. Level II operations would monitor current or potential problems. An optimum system would require Level I operations at all nine stations. A minimum system would require Level II operations at most of the stations. (Woodard-USGS)

Identifiers: Neutron activation analyses, Asterionella-Formosa, *Columbia River, Fragilaria-Crotonensis, Melosira-Sp, Metals, Minerals, Phytoplankton, River, Seasonality, Synedra-Sp, Tabellaria-Sp, *Trace elements, Water.

Water and phytoplankton samples were collected upstream from the Hanford Atomic Works Project at 5 'ecologically significant' times of the year for analysis by neutron activation techniques. Collections were in Nov. (fall phytoplankton bloom), Feb. (mid. winter), April (spring phytoplankton bloom), June (summer high-water), and Aug. (summer stratification). Elements analyzed in the phytoplankton were: Ag, Br, Co, Cr, Cs, Fe, Hg, K, Na, Rb, Sb, Sc, Se and Zn. Additional elements analyzed in the water were: As, Au, Cu, Mn and U. Monthly samplings of phytoplankton and water were analyzed by standard methods for Ca, Mg, Na, K, Zn, Cu and P for comparison. Net plankton is dominated by Asterionella formosa and Fragilaria crotonesis with significant populations of Tabellaria sp., Synedra sp. and Melosira sp. Concentration factors of the elements in the phytoplankton are presented. Neutron activation techniques were shown to be clearly superior to conventional techniques for detection of micro quantities.--Copyright 1973, Biological Abstracts, Inc.

BACTERIAL IDENTIFICATION BY MICROCALORIMETRY,
Veterans Administration Hospital, Boston, Mass.
E. A. Boling, G. C. Blanchard, and W. J. Russell.
Nature, Vol 241, No 5390, p 472-473, February 16, 1973. 1 fig, 1 ref.

Descriptors: *Pollutant identification, Cultures, Streptococcus, E. coli, Speciation, Separation techniques.
Identifiers: *Microcalorimetry, Enterobacter aerogenes, Klebsiella, Proteus vulgaris, Enterobacter cloacae, Proteus rettgeri.

Seventeen species from 10 genera of Enterbacteriaceae were grown on brain-heart infusion (BHI) medium and analyzed by microcalorimetry as a means of differentiating species. The profiles were recorded on a strip chart recorder for periods up to 14 hrs. Using the curves, it was possible to discriminate between all the species tested. Profiles are included for Enterobacter aerogenes, Klebsiella, Proteus vulgaris, Enterobacter cloacae, Escherichia coli, and Proteus rettgeri. Streptococcus faecalis was also among the bacteria investigated. Microcalorimetry promises to be a rapid and specific means of characterization of Enterobacteriaceae and possibly other bacteria. A SIMPLE MODIFICATION OF A FLAME PHOTOMETER FOR ROUTINE TRACE POTASSIUM ANALYSIS,
Bell Telephone Labs., Inc., Reading, Pa.
W. R. Knolle.
Applied Spectroscopy, Vol 27, No 2, p 142, March/April 1973. 1 fig, 4 ref.

Descriptors: *Potassium, *Aqueous solutions, *Chemical analysis, *Flame photometry, Pollutant identification, Instrumentation, Laboratory equipment, *Trace elements.
Identifiers: Trace levels, Detection limits.

A flame photometer was modified for potassium analysis in the ppb range in solution in order to avoid the cost and inconvenience involved in changing the grating and photomultiplier tube on a general purpose instrument. An instrumentation Laboratory model IL 153 atomic absorption spectrometer was used in the flame emission mode with an RCA 1P21 photomultiplier tube operated at 1200 V. The modification consisted of setting the grating of the spectrometer to zero wave length and using it as a mirror instead of as a monochromator. A first order least squares analysis of the data obtained from standards prepared with deionized water, which had been demineralized and filtered, yielded a correlation coefficient of 0.99991. Five 2-ml samples of dilute HF were analyzed for K, and the calculated standard deviation multiplied by a statistical factor yielded 1.1 mg of K as a detection limit. This easily realizable working limit is 2 orders of magnitude better than that achieved without the modification. This modification should be generally applicable to any emission flame photometer where the detection limit is restricted by photomultiplier tube and grating response. (Holoman-Battelle)

RAPID DETERMINATION OF VERY LOW NITROGEN LEVELS IN WATER,
California Univ., Davis. Dept. of Applied Science.
S. F. Bankert, S. D. Bloom, and F. S. Dietrich.
Nature, Vol 242, No 5395, p 270-271, March 23, 1973. 2 fig, 1 tab, 9 ref.

Descriptors: *Assay, *Water analysis, Methodology, *Pollutant identification, *Radioactivity techniques, Nutrients, *Nitrogen, Gamma rays, Chemical analysis, Potable water, Rivers, Municipal water, *Neutron activation analysis.
Identifiers: *Trace levels, Charged particle activation analysis, N-14, Nitrogen radioisotopes, Sensitivity, Detection limits, Lake Tahoe, Sacramento River, Accuracy.

A new approach to N-14 assay is associated with the evaporated detritus of less than 4 ml of water. This method, termed charge particle (nuclear) activation analysis (CPAA), has an activation and subsequent decay of minus 5.9 MeV and 71.0 s, respectively. The presence of nitrogen is measured by counting the number of 2.31 MeV gamma rays emitted in the decay reaction. The present overall accuracy is about plus or minus 25 percent at concentrations greater than 20 mg/kg; the test is sensitive down to 20 mg/kg. The testing time per sample is about 3 min without any destruction of the sample. The method has been applied to water samples from Lake Tahoe, the Sacramento River, municipal wells, and public drinking fountains. (Holoman-Battelle)

CHLORINATED HYDROCARBON PESTICIDES AND RELATED COMPOUNDS IN ADIPOSE TISSUE FROM PEOPLE OF JAPAN,
Environmental Protection Agency, Chamblee, Ga. Chamblee Toxicology Lab.
A. Curley, V. W. Burse, R. W. Jennings, E. C. Villanueva, and L. Tomatis.
Nature, Vol 242, No 5396, p 338-340, March 30, 1973. 4 fig, 2 tab, 13 ref.

Descriptors: Chemical analysis, *Chlorinated hydrocarbon pesticides, *Polychlorinated biphenyls, *Pesticide residues, *Pollutant identification, Methodology, Dieldrin, DDT, Insecticides, Fungicides, Absorption, *Gas chromatography.
Identifiers: *Animal tissues, *Adipose tissue, Heptachlor epoxide, Isomers, Metabolites, Hexachlorobenzene, GC-Mass spectrometry, Column chromatography, Sample preparation, Gas liquid chromatography, Lindane, Japan, o p' DDE, p p' DDE, o p' DDT, p p' DDD, p p' DDT, Fat tissue, Electron capture gas chromatography, alpha-Hexachlorocyclohexane, gamma-Hexachlorocyclohexane, beta-Hexachlorocyclohexane, Bioaccumulation, Coulson conductometry, Electrolytic conductometric gas chromatography.

Japanese autopsy adipose tissue samples were analyzed by electron capture gas chromatography and the following chlorinated hydrocarbons were found: hexachlorobenzene (HCB), polychlorinated biphenyls, dichlorodiphenyl trichloroethane (DDT), dieldrin (HEOD), heptachlor epoxide, and the alpha, gamma, and beta isomers of hexachlorocyclohexane (HCCH). Two-column gas chromatography, Coulson conductometry and 'Florisil' elution patterns were accepted as sufficient confirmation for the presence of all reported compounds except hexachlorobenzene and PCBs. HCB was substantiated by electron capture and electrolytic conductometric gas-liquid chromatography and gas chromatography-mass spectrometry. The presence of PCB's was verified by electrolytic conductivity and gas chromatography-mass spectrometry. All samples analyzed were positive for PCBs. Eighty percent of the samples had a PCB concentration of less than 1.0 ppm. (Holoman-Battelle)

ORGANIC MERCURY COMPOUNDS IN COASTAL WATERS,
Connecticut Univ., Groton. Marine Sciences Inst.
W. F. Fitzgerald, and W. B. Lyons.
Nature, Vol 242, No 5398, p 452-453, April 13, 1973. 2 tab, 18 ref.

Descriptors: *Mercury, *Pollutant identification, Rivers, Heavy metals, Chemical analysis, Water analysis, Sea water, Trace elements, Water sampling.
Identifiers: *Coastal waters, *Organic mercury, *Flameless atomic absorption spectrophotometry, Metal complexes, Sample preparation, *Long Island Sound, Photooxidation.

Determinations of total and inorganic mercury were made on coastal and river waters near Long Island Sound. Two different 100-ml sets of samples were collected in glass bottles and acidified to pH 1.0 with redistilled concentrated nitric acid. One set was analyzed immediately for inorganic Hg; the other was photooxidized for 24 hr and aliquots were analyzed for total Hg. Flameless atomic absorption spectrophotometry was used in both cases. The total Hg concentrations were 0.045-0.078 ppb and those of inorganic Hg were 0.021-0.033 ppb. It is significant that as much as 50-60 percent of the mercury present in those waters may exist either as organic compounds or in association with organic matter. (Holoman-Battelle)

FROZEN PREPARED MICROBIOLOGICAL CULTURE MEDIA,
Philadelphia Coll. of Pharmacy and Science, Pa. Dept. of Bacteriology.
B. Witlin.
Mycopathologia et Mycologia Applicata, Vol 49, No 2-3, p 137-139, March 15, 1973. 8 ref.

Descriptors: *Storage, *Bacteria, *Freezing, Cultures, Microbiology.
Identifiers: *Culture media, *Agars, *Broths, Nutrient broth, Nutrient agar, Nutrient gelatin, Trypticase soy broth, Trypticase soy agar, Trypticase soy blood agar, Endo agar, E.B.M. agar, MacConkey agar, Russell's double sugar agar, Triple sugar iron agar, Sabouraud broth, Sabouraud agar, M.R.-V.P. broth, Dunham's peptone solution, Purple milk, Litmus milk, Littman agar, Chocolate agar, Martin-Lester transgrow media, Loeffler's media, Lowenstein-Jensen media, Thioglycollate broth, Phenol red broth, Mannitol, Arabinose, Xylose, Glycerol, Rhamose, Trehalose.

Thirty culture media were stored in a freezer at minus 5 C and minus 20 C and evaluated at weekly intervals for periods of one year. After storage, the media were removed, ovserved for physical appearance, thawed at room temperature, inoculated with test organisms (Streptococcus, Staphylococcus, Enterobacter, Salmonella, Pseudomonas, Proteus, Candida, Trichophyton, Neiserria, Corynebacterium, Mycobacterium) and incubated. With the exception of blood agar, the frozen and thawed media were satisfactory with regard to appearance, consistency, and as a substitute for biochemical reactions. Consequently, single freezing of culture media provides a practical and convenient method for preserving and storing noncellular substrates for long periods. (Little-Battelle)

AGAR-PLUG CUTTER AND INOCULATION DEVICE,
Western Regional Research Lab., Berkeley, Calif.
R. H. Kurtzman, Jr.
Mycologia, Vol 65, No 1, p 236-239, January-February 1973. 3 fig, 5 ref.

Descriptors: *Laboratory equipment, Cultures, Design, Microbiology, Methodology.
Identifiers: *Agar-plug cutter, *Inoculation, Agars.

An agar-plug cutting device is described which can be made in a wide variety of sizes and can be sterilized by any ordinary means. The device is constructed from a cutoff No. 18 syringe needle, a serum stopper, and an antibiotic assay cup or other short length of stainless steel tubing. The tubing which serves as a cutter is drilled lengthwise to allow the syringe needle to be inserted. A second, larger hole is drilled lengthwise in the tubing, but only to a depth of about 2 mm. The serum stopper is placed over the needle to provide an air-tight seal so that when the cutter is inserted into the agar, the vacuum created by withdrawing the needle will retain the plug in the tubing. The needle is also used to eject the plug onto the plate to be inoculated. A control unit was also developed to improve the use of the device. Using the completed device, it was possible to inoculate 50 plates in 10 minutes. (Little-Battelle)

MICRODETERMINATION OF FORMIC, OXALIC AND ACETIC ACIDS IN THEIR MIXTURE BY SELECTIVE OXIDATION,
Allahabad Univ. (India). Chemistry Labs.
P. K. Jaiswal.
Zeitschrift fur Analytische Chemie, Vol 263, No 4, p 335-336, March 6, 1973. 3 ref.

Descriptors: *Chemical reactions, Methodology, Organic acids, Oxidation, Chemical analysis, Pollutant identification.
Identifiers: *Oxalic acid, *Acetic acid, Mixtures, *Formic acid, Silver, Ditellurato argentate, Diperiodato cuprate, Chemical interference, Accuracy, Precision, Ditellurato cuprate, Reagents.

Formic, oxalic and acetic acids have been determined in their mixture by selective oxidation with Ag (III) and Cu (III) reagents. Ag (III) oxidizes only formic acid under specific conditions. Diperiodato cuprate (III) solution oxidizes only formic and oxalic acids under verified conditions, whereas ditellurato cuprate (III) solution oxidizes formic, oxalic as well as acetic acids. Thus by the use of these three oxidants the three acids can be determined separately in their mixture. Formic, oxalic and acetic acids require 2, 2 and 8 equivalents of oxidant for their complete oxidation. The quantities of the three acids have been calculated in g.mole. Experiments have been repeated several times with about 0.00002-0.00006 g.moles of substance and results are obtained with plus or minus 0.8 percent deviation. Interferences are observed in the presence of other inorganic and organic substances. (Holoman-Battelle)

Identifiers: *Preconcentration, *Biological samples, Molecular sieves, Freeze concentration, Volatilization, Coprecipitation, Gel filtration, Gel permeation, Ultrafiltration, Electrophoresis, Sublimation, Partition chromatography, Scavenging, Gas solid chromatography, Sr-90, Y-90, Cs-137, Tellurium, Amalgamation, Masking, Chemical interference, Ashing, Sample preparation, Liquid-liquid extraction, Electrodeposition, Adsorbents, Uranium, Silver, Antimony, Bismuth, Gallium, Zirconium, Hafnium, Scandium, Lanthanum, Cerium, Tungsten, Indium, Vanadium, Paper chromatography, Thin layer chromatography, Silylation, Abate, Detection limits, Rubidium, Yttrium.

A general review is given of methods for separation and preconcentration of analytes. Among the methods of preconcentration reviewed are ashing, evaporation, freeze concentration, froth flotation, reverse osmosis, adsorption, liquid-liquid extraction, amalgam methods, volatilization, electrodeposition, and ion exchange. Separation methods reviewed included molecular sieves, gel filtration, gel permeation, gaseous diffusion, ultrafiltration, electrophoresis, sublimation, distillation, foam fractionation, absorption chromatography, gas-solid chromatography, scavenging by colloids, crystallization, freeze separation, zone refining, paper, partition, and thin layer chromatography, liquid-liquid extraction, ion exchange, electrodeposition, amalgam methods, and masking and demasking. Several of the techniques are discussed in relation to analysis of water for heavy metals, organic compounds, and other contaminants. (Little-Battelle)

TITRIMETRIC MICRODETERMINATION OF NICKEL AND COBALT, SEPARATELY AND IN PRESENCE OF EACH OTHER,
Allahabad Univ. (India). Chemistry Labs.
S. Saxena, and J. D. Pandey.
Zeitschrift fur Analytische Chemie, Vol 263, No 3, p 208, February 7, 1973.

Descriptors: *Nickel, *Cobalt, *Volumetric analysis, *Pollutant identification, Heavy metals, Cations, Alkaline earth metals, Chemical analysis, Lead, Iron, Aluminum, Magnesium, Cadmium, Beryllium, Calcium, Zinc, Dyes.
Identifiers: *Ionic interference, Chemical indicators, Accuracy, Rare earth elements, Sensitivity, Chemical interference, Gallium, Neodymium, Gadolinium, Tellurium, Niobium, Rhenium, Thallium, Barium, Indium, Praseodymium, Uranium, Xylenol orange, Hippuric acid, Chromazurol red S.

A new method for the determination of Ni and Co, separately and in mixture is based on titration with hippuric acid. Xylenol orange (and chromazurol red S) are employed as indicators. Maximum error observed for Ni and Co was 2.0 percent and 1.9 percent, respectively, when determined separately and 1.9 percent and 1.9 percent, respectively, when determined from a mixture. Amounts taken were in the range of about 60-400 mg. The following ions caused interferences: Pb, Fe, Ga, Al, Nd, Gd, Zr, Te, Nb, Re. No interferences are caused by Tl, Mg, Cd, Be, Ca, Ba, Zn, In, Pr, U. A most important precaution in this method is a thorough cleaning of the beakers used with sodium carbonate or chromic acid, since otherwise the exact color change may not be obtained. OXYGEN DEMAND OF EFFLUENT FROM A BLEACHED KRAFT PULP MILL,
Dalhousie Univ., Halifax (Nova Scotia). Dept. of Biology.
J. G. Ogden, III.
Water, Air, and Soil Pollution, Vol 1, No 4, p 365-374, September 1972. 1 fig, 6 tab, 9 ref.

Descriptors: *Oxygen demand, *Effluents, *Pulp and paper industry, Chemical oxygen demand, Biochemical oxygen demand, Organic loading, Water sampling, Water chemistry, Gas chromatography, Industrial wastes, *Pulp wastes, Aeration, Mechanical control, Hydrogen ion concentration, Water properties, Color, Sulfates, Hydrogen sulfide, *Chlorides, Sea water, Suspended solids, Dissolved solids, *Canada.
Identifiers: Characterization, *Bleached pulp wastes, Gravimetric analysis, Total oxygen demand, Settleable solids, Transparency.

Since the fall of 1967, a 160 hectare former tidal estuary has been dammed and used as a waste water treatment facility for a 500-700 metric tons per day bleached sulfate kraft pulp mill at Abercrombie Point, Nova Scotia. The treatment system is subdivided into a 16 hectare settling pond to remove coarse suspended solids, and a 144 hectare stabilization pond. Volume of the two basins indicates a total detention time of 15 to 25 days, depending upon plant flow rates. Total solids input to the treatment system (determined by evaporation at 105 C) amounts to 1.29 g/l. Settling and oxidation in the basin accounts for approximately 0.29 g/1. Because of plant flow rates of 95 million per day, nearly 100 metric tons of solids are released to the marine environment daily. Determinations indicate that at present loadings, more than 10 metric tons of BOD per day are entering a poorly flushing coastal environment. Chemical Oxygen Demand (COD) values are from 2 to 10 times greater than BOD. Effects of mechanical aeration and massive lime treatment of the effluent for removal of solids and 02 demand are discussed. Consequences of alternative treatment methods and continued utilization of the treatment basin are considered. (Holoman-Battelle)

A BIOLOGICAL EVALUATION OF THE MOLYBDENUM BLUE METHOD FOR ORTHOPHOSPHATE ANALYSIS,
Wisconsin Univ., Madison. Water Chemistry Program.
C. P. Walton, and G. F. Lee.
Verhandlungen der Internationalen Vereiningung fur Theoretische Limnologie, Vol 18, p 676-684, 1972. 5 fig, 2 tab, 9 ref.

Descriptors: *Analytical techniques, *Measurement, *Phosphates, Nutrients, Algae, Bioassay, Plant growth, Laboratory tests.
Identifiers: *Molybdenum blue method, *Orthophosphate, Lake Mendota (Wis).

One of the primary utilities of orthophosphate measurements is to estimate the concentration of

biologically available phosphorus, thus it is essential that the relationship between the soluble orthophosphate concentrations determined by the molybdenum blue method and the soluble phosphate concentrations that are available as plant nutrients be known. This investigation compares the soluble reactive molybdenum blue phosphorus present in water samples to the amount of algal growth as achieved in a standardized bioassay procedure where the growth is limited by the phosphorus concentration present in the sample. The Lake Mendota waters tested were fortified with the nutrients contained in the Provisional Algal Assay Procedure media such that the growth of the test organism would be limited by the amount of phosphorus available in the test water. There was no discrepancy between the amounts of growth of the test organisms in the lake water, sediment extracts, and algal detritus extracts predicted by the molybdenum blue soluble orthophosphate and the growth of the test organism in the test media with a corresponding amount of soluble orthophosphate added. It is recommended that both chemical and biological tests be applied before extensive reliance is made on the molybdenum blue method. (Jones-Wisconsin)

EVALUATION OF COLIFORM TESTS FOR CHLORINATED SECONDARY EFFLUENTS,
Illinois State Water Survey, Peoria. Water Quality Section.
S. Lin.
Journal Water Pollution Control Federation, Vol 45, No 3, p 498-506, March 1973. 5 fig, 4 tab, 10 ref.

Descriptors: *Cultures, *Chlorination, *Separation techniques, Sewage effluents, Coliforms, Pollutant identification, *Illinois, Waste water treatment, Treatment facilities.
Identifiers: *Fecal coliforms, *Membrane filter, Most probable number test, Method evaluation.

The purpose was (1) to determine whether or not the LES two-step enrichment MF technique for total coliforms assay on chlorinated effluents is comparable to the recommended MPN method and (2) to compare fecal coliform detection by M-FC MF technique on chlorinated secondary effluents with the MPN procedure. Grab samples of secondary effluent were collected from three Illinois treatment plants, chlorinated with up to 6 mg/l of chlorine, stirred, dechlorinated after various periods of contact by sodium thiosulfate, and assayed. The results showed that the LES two-step MF procedure is comparable to the completed MPN techniques for total coliform detection in chlorinated secondary effluents. Total coliform recovery in chlorinated effluent by the LES two-step MF technique was approximately 1.5 times that observed using the M-Endo, one-step MF procedure. Fecal coliform recovery using the M-FC MF technique on chlorinated effluent was less than that obtained using confirmed MPN in EC broth. Estimates of MPN densities in chlorinated secondary effluent might be useful from currently acceptable MF procedures by using a mathematical relationship similar to log MPN equals to 1.062 log MF minus 0.014. (Little-Battelle)

EDAPHIC FACTORS OVERRIDE A POSSIBLE GRADIENT OF ECOLOGICAL MATURITY INDICES IN A SMALL STREAM,
North Carolina Univ., Chapel Hill. Dept. of Botany.
A. F. Motten, and C. A. S. Hall.
Limnology and Oceanography, Vol 17, No 6, p 922-926, November 1972. 2 fig, 20 ref. OWRR B-007-NC (7).

Descriptors: *Trophic level, *Respiration, *Primary productivity, *Pigments, Ecology, Dissolved oxygen, Spectrophotometry, Separation techniques, Benthos, *North Carolina.
Identifiers: Sample preparation, *New Hope Creek (NC), *Edaphic factors.

The objective was to apply Margalef's (1963, 1965) maturity indices to two regions of New Hope Creek, North Carolina to test the hypothesis that upstream regions are less ecologically mature than downstream regions. Two parameters were measured at three locations in the streams: pigment ratios, or the ratios of the optical densities at 430 and 665 millimicrons, and the ratio of gross productivity to community respiration (P:R). Oxygen was measured by both the Winkler method and a galvanic probe recorder. Pigment analyses were based on random samples of benthic communities. These samples were centrifuged, ground in acetone, and the absorbance of the extracted pigment read on a spectrophotometer. Within the limited scope of this study no support was found for the original proposition that the upstream region of the stream was less ecologically mature than the downstream region. If differences in ecological maturity do exist between the two sites studied, they are not properly measured by pigment ratios or P:R ratios, or, more probably, they are overridden by local or edaphic factors. PHYTOPLANKTON OBSERVATIONS IN THE EASTERN CARIBBEAN SEA,
Old Dominion University, Norfolk, Va. Dept. of Biology.
H. G. Marshall.
Hydrobiologia, Vol 41, No 1, p 45-55, February 28, 1973. 1 fig, 3 tab, 9 ref.

Descriptors: *Marine algae, *Phytoplankton, Nannoplankton, Chrysophyta, Cyanophyta, Pyrrophyta, Ecological distribution, Dominant organisms, Diatoms, Nansen bottles, Hydrography, Water sampling, Dinoflagellates, Water temperature, Dissolved oxygen, Depth.
Identifiers: *Caribbean Sea, Silicoflagellates, Coccolithophores, Species diversity, Flagellates, Sample preservation, Amphiprora, Amphora, Caloneis, Cocconeis, Diploneis, Fragilaria, Pleurosigma, Amphidinium, Gonyaulax, Phalacroma, Asterolampra marylandica, Bacteriastrum comosum, Biddulphia mobiliensis, Cerataulina pelagica, Chaetoceros species, Coscinodiscus species.

In order to obtain phytoplankton and hydrographic data, water samples were taken at 11 sites along transects in Caribbean Sea on two different cruises, January 1969 and January 1970, west of the Lesser Antilles. Another series of collections were made off the coast of Venezuela (January 1968). A total of 88 taxa were noted in these samples, of which there were 44 diatoms, 41 pyrrhophyceans, 2 cyanophyceans and 1 silicoflagellate. Totals of 37 and 38 different phytoplankters were observed during cruises E46K-67-68 and E1-C-70, respectively, with 58 species noted in the extensive samplings of E 50D-68-69. A diatomaceaous flora predominated in each series of collections. The phytoflagellates were well represented, but in low numbers. The overall phytoplankton concentrations were low for each of the areas studied during these three January cruises. Even the preliminary data on the coccolithophore concentration do not indicate a major development at this time of the year. The present results indicate a substantial contribution made by the nannoplankton. In this series of January collections they consisted predominately of the diatom Melosira sp. In these offshore waters various species of the genus Rhizosolenia were most abundant. Only one bloom condition was noted and this consisted of Noctiluca scintillans. There were 13 phytoplankters found during each of the three cruises, having a distribution that extended over the eastern Caribbean. These were the diatoms, Coscinodiscus sp., Rhizosolenia alata, R. hebetata semispina, Navicula sp., Thalassiothrix frauenfeldii, Pleurosigma sp., and the pyrrohophyceans, Ceratium fusus, C. trichoceros, C. tripos, Podolampas spinifera. These were in addition to Dictyocha fibula, Skujaella thiebantii, and Richelia intracellularis. (Holoman-Battelle)

A ZOOGLOEA BACTERIUM WITH GELATINOUS MUCOPOLYSACCHARIDE MATRIX,
Tokyo Metropolitan Univ. (Japan). Dept. of Biology.
Y. Tezuka.
Journal Water Pollution Control Federation, Vol 45, No 3, p 531-536, March 1973. 2 fig, 2 tab, 26 ref.

Descriptors: *Pollutant identification, *Cultures, *Separation techniques, *Activated sludge, Systematics, Chromatography.
Identifiers: *Zoogloea, Culture media, Paper chromatography, Characterization, Amino sugars, N-acetylglucosamine, N-acetylfucosamine.

A zoogloea-forming bacterium was isolated from activated sludge and identified tentatively as belonging to the genus Zoogloea. The bacterium grew in liquid media with the formation of amorphous gelatinous colonies in which the bacterial cells were sparsely embedded. The gelatinous substance was isolated and purified partially: it was a mucopolysaccharide composed primarily of two amino sugars. One of these sugars was identified as N-acetylglucosamine, and the other was suggested to be N-acetylfucosamine. The molar ratio of the former to the latter was approximately 1:2. The polymer was quite resistant to the action of the microfloras from wastewater and soil. (Little-Battelle)

PHAGE-TYPING OF STAPHYLOCOCCUS AUREUS,
Central Public Health Lab., London (England).
M. T. Parker.
In: Methods in Microbiology, Vol 7B, Academic Press, New York. 1972. p 2-28, 2 fig, 4 tab, 51 ref.

Descriptors: *Separation techniques, *Pollutant identification, Cultures, Methodology, Laboratory equipment, *Systematics, *Bacteriophage.
Identifiers: *Phage typing, Data interpretation, Culture media, *Staphylococcus aureus, Phages.

This chapter of 'Methods in Microbiology' discusses the historical development and present technical methods of phage typing as a means of distinguishing Staphylococcus aureus, interpretation of results from phage typing, staphylococci from domestic animals, taxonomic significance of phage typing, and the future potential of the method. The section on technical methods thoroughly reviews the media and conditions of growth, propagation and testing of phages, typing, and reading and reporting of results. The section on interpretation discusses the range and causes of variability and long-term changes in typing patterns. (Little-Battelle)

SOME TRACE ELEMENT CONCENTRATION VARIATIONS OBSERVED IN MARINE ORGANISMS THAT SUGGEST CAUTION IN SAMPLING,
Scripps Institution of Oceanography, La Jolla, Calif. Soledad Marine Radioactivity Lab.
T. R. Folsom, V. F. Hodge, K. M. Wong, R. Kishore, and V. P. Guinn.
Report No. TID-26198, May 24-26, 1972. 14 p, 1 fig, 8 tab, 1 ref.

Descriptors: *Bioindicators, *Mercury, *Zinc, *Lead, Heavy metals, *Marine fish, *Trace elements, Invertebrates, Kelps, Marine algae, Clams, Mollusks, Snails.
Identifiers: *Data interpertation, *Selenium, *Bioaccumulation, Albacore tuna, Dolphins, Polonium, Scandium, Horse clam, Bubble snail, Turban snail, Sea hare, Skipjack tuna, Elk kelp, Biological samples, Macroinvertebrates, Pb-210, Po-210, Pelagohycus porra, Spleen, Kidneys, Tail fin, Liver, Bone, Gills, Heart, Stomach contents, Brain, Flesh, Muscle, Skin, Gall bladder, Eyes, Thunnus alalunga, Katsuwonus pelamis, Blood, Norrisia norrisi, Bulla gouldiana, Tresus nuttallii, Aplysia californica, Ovaries, Testes, Spermalotheca, Body fluids, Genital duct.

Data were accumulated on accumulations of Hg, Se, Zn, Pb, Pb-210, and Po-210 in elk kelp, Zn, Se, and Po-210 in albacore, Po-210 in skipjack, Po-210, Pb-210, Hg, Se, and Zn in dolphins, and Po-210 in horse clams, bubble snails, brown turban snails and sea hares. Analysis of these data shows that concentrations of metals vary greatly from one organ to another. If whole-body residues or residues in organs not specific for certain elements are measured, errors much larger than those from analytical procedure may result. Consequently, it is only possible to draw valid conclusions from data which have been obtained with normal, averaged, or otherwise standardized conditions. (Little-Battelle)

FAST LIQUID CHROMATOGRAPHY,
Kyoto Univ. (Japan). Faculty of Science.
H. Hatano.
Research/Development, Vol 24, No 4, p 28-32, April 1973. 11 fig, 14 ref.

Descriptors: *Instrumentation, *Laboratory equipment, Research equipment, *Organic compounds, *Automatic control, *Chemical analysis, *Pollutant identification, Amino acids, Automation, Separation techniques, Selectivity, Aromatic compounds, *Chromatography.
Identifiers: High speed liquid chromatography, Spectrophotofluorimeter, Automatic amino acid analyzer, Ultraviolet absorption detector, Differential refractometric detector, Flow spectrophotofluorimetric detector, Gel permeation chromatography, Spectrophotometric detector, Biological samples, Sensitivity, Liquid chromatography, Hitachi 634 liquid chromatograph, Hitachi KLA-5 amino acid analyzers, Naphthalene, Phenathrene, Pyrene, Triphenylene, Chrysene, Anthracene, 1 2-Benzanthracene, 1 2-Benzopyrene, Uridine, 2 3-Benztriphenylene, Guanosine, Adenosine, Cytidine, Benzene, Benzothiophene, Dibenzothiophene, Chromatographic columns.

Instrumentation developed in Japan is described, including the latest chromatographs and detectors available. The specific equipment is: (1) an automatic liquid chromatograph, consisting of a chromatographic separation system which utilizes an automatic fractionation mode, a two-wavelength spectrophotometric detector, and an automatic operation system; (2) an automatic amino acid analyzer equipped with three constant-flow delivery pumps and a three-wavelength flow photometric detector in continouous flowing mode; (3) an automatic liquid chromatograph equipped with a three-wavelength flow-spectrophotometric detector selective to wavelengths of 200 and 750 nm; (4) a high speed liquid chromatograph equipped with a high efficiency column for gel-permeation chromatography. It has also been equipped with a differential refractometer operating on Fresnell's principle; and (5) the FLC-1 fast chromatograph equipped with a flow spectrophotofluorimeter. The ultraviolet absorption, differential refractometric, and flow spectrophotofluorimetric detectors have been used with this equipment. Hitachi KLA-5 amino acid analyzers have been used for accelerated analyses of amiono acids and related ninhydrin compounds. The Hitachi 634 liquid chromatograph has been used for other organic and biological compounds. (Holoman-Battelle)

DETECTION OF ORGANO-PHOSPHORUS PESTICIDE RESIDUES IN AUTOPSY TISSUES BY THIN-LAYER CHROMATOGRAPHY,
Chemical Examiner's Lab., Agra (India) Toxicology Div.
S. N. Tewari, and S. P. Harplani.
Mikrochimica Acta, Vol 2, p 321-324, March 1973. 1 tab, 23 ref.

Descriptors: *Separation techniques, *Solvents, *Diazinon, Pesticides, *Pesticide residues, Phenols, Pollutant identification, Organophosphorus pesticides, Phosphothioate pesticides, *Chromatography.
Identifiers: *Thin layer chromatography, *Liver, *Sample preparation, Ethyl parathion, Methyl parathion, Meta-systox, p-Nitrophenol, Tissue, Biological samples, Organic solvents, Benzene, Malathion, Nitrophenol.

A method of extracting organophosphorus pesticides from postmortem human tissues (liver), and their separation and identification by thin-layer chromatography are described. The respective metabolites are also separated. The insecticides used as controls were: ethyl parathion, methyl parathion, malathion, diazinon and meta-systox. The liver sample was extracted by homogenizing with anhydrous sodium sulfate and redistilled acetone, filtering, evaporating the solution, extracting the residue with n-hexane, and partitioning with acetonitrile. After evaporation of the acetonitrile layer, the residue was dissolved in ethanol for spotting on thin layer plates. Four solvent systems were evaluated: cyclohexane-acetone (40:5 and 40:15), cyclohexane-ethylmethyl

ketone (40:1), and benzene. Benzene was suitable for separation of ethyl parathion, methyl parathion, malathion, diazinon and meta-systox on silica gel thin layers. Rhodamine B was used as the detection reagent. Other solvents were superior for separation of mixtures of metabolites of some of these pesticides. (Little-Battelle)

TRACING OIL AS A POLLUTANT IN WATER,
Environmental Protection Agency, Redmond, Wash. Regional Lab.
N. J. Malueg, and D. F. Krawczyk.
Journal of Petroleum Technology, Vol 25, p 243-248, March 1973. 1 fig, 9 tab, 16 ref.

Descriptors: *Tracking techniques, *Oil spills, Water pollution sources, *Pollutant identification, Methodology, *Water analysis, Oil pollution, Oily water, Gas chromatography, Sulfur, Chemical analysis, Iron, Nickel, Zinc, Heavy metals, Solvent extractions, Separation techniques.
Identifiers: *Oil characterization, *Oil fingerprinting, Sample preparation, Petroleum products, Chemical recovery, Chemical composition, Precision, Fuel oil, Infrared scans, Lube oil, Vanadium, Atomic absorption, Crude oil, Diesel oil, Oil types, Organic solvents, Paper strip method, Bunker fuel oil, Medium oil, Light oil.

An approach used to trace an oil or a petroleum product found in or on water to a source is delineated. Sample preparation involves extracting a volume of the sample with a solvent, rinsing with distilled water to form an emulsion, and extracting with additional solvent. The solvent is filtered and removed completely by passing clean, dry nitrogen over the solvent-oil mixture in a hot water bath. The oil is then dessicated so that further analysis can proceed. The paper strip and gas chromatographic methods are used for comparing a source with a spill and the chromatographic fluorescence method is used for comparing samples of petroleum products. Infrared scans are used to compare oily water with potential sources. Sulfur and metallic techniques are used to determine sulfur and metal content. All the data collected are compared with data on crude and refined products and some judgment can be made as to whether the sample is a crude or refined product and on the locality of the original crude. The 'fingerprints' of the oil can then be compared with possible sources. (Holoman-Battelle)

DIFFERENTIATION OF SOME ENTEROCOCCI BY GAS CHROMATOGRAPHY,
Iowa State Univ., Ames. Dept. of Bacteriology.
C. F. Amstein, and P. A. Hartman.
Journal of Bacteriology, Vol 113, No 1, p 38-41, January 1973. 1 fig, 2 tab, 21 ref.

Descriptors: *Pollutant identification, *Gas chromatography, *Streptococcus, *Separation techniques, Bioindicators, Enteric bacteria, Water pollution sources, Cultures.
Identifiers: *Fatty acids, Streptococcus faecalis, Streptococcus faecium Streptococcus faecium var. durans, Streptococcus faecium var. casseliflavus, Sample preparation, Culture media.

If enterococci are to be useful as indicators of fecal pollution in foods, it will be necessary to differentiate fecal and non-fecal types. A method was attempted which involved determining relative fatty acid compositions of 37 enterococci by gas chromatography. Streptococcus faecalis, Streptococcus faecium, and Streptococcus faecium var. casseliflavus, and a motile yellow-pigmented streptococcus, contained very low levels of C sub 19:0 cyclopropane fatty acid and four unidentified components, compared to the other strains of enterococci examined. The studies clarified the relationships between existing species and varieties, but showed no significant differences in the fatty acid patterns of enterococci grouped according to plant, animal, or human source. THE DETERMINATION OF TRACE METALS AND THEIR SIGNIFICANCE IN CLINICAL CHEMISTRY,
Hospital for Sick Children, London (England).
H. T. Delves.
Atomic Absorption Newsletter, Vol 12, No 2, p 50-54, March-April 1973. 4 fig, 3 tab, 26 ref.

Descriptors: *Copper, *Lead, *Zinc, Cadmium, Manganese, Cobalt, Iron, Nickel, Heavy metals, *Trace elements, *Metals.
Identifiers: *Blood, *Plasma, Sample preparation, *Atomic absorption spectrophotometry, Flame microsampling, Furnace atomization, Sensitivity, Precision, Delves cup method, Flameless atomic absorption spectrophotometry, Ashing.

Because of the relationship of both essential and non-essential trace metals to human health and environmental conditions, analysis of trace metals in tissue, blood, urine, and plasma is important. Work is reviewed in developing methods or analyzing lead in blood and urine, copper in plasma, and copper and zinc in plasma protein fractions. Difficulties with flame AA analysis of lead in blood and urine have been overcome by using flame-assisted microsampling techniques or furnace atomization techniques. Flame microsampling has also been used to determine copper in plasma. Furnace atomization has proven useful for determining less volatile metals and has been used to investigate copper and zinc concentrations in plasma fractions. The sensitivity and precision of this technique are given for Zn, Cd, Mn, Pb, Cu, Co, Fe, and Ni. (Little-Battelle)

TRACE ELEMENT DETERMINATION WITH SEMICONDUCTOR DETECTOR X-RAY SPECTROMETERS,
California Univ., Berkeley. Lawrence Berkeley Lab.
R. D. Giauque, F. S. Goulding, J. M. Jaklevic, and R. H. Pehl.
Analytical Chemistry, Vol 45, No 4, p 671-681, April 1973. 17 fig, 6 tab, 20 ref.

Descriptors: *X-ray spectroscopy, Air, *Aqueous solutions, Separation techniques, *Heavy metals, Rocks, Chromium, Manganese, Iron, Nickel, Copper, Zinc, Bromine, Strontium, Lead, Potassium, Calcium, Titanium, Absorption, Air pollution, Calibrations, Laboratory equipment, *Trace elements.
Identifiers: Blood, Sample preparation, Orchard leaves, *Semiconductor detector, Detection limits, Biological samples, Freeze drying, Arsenic, Rubidium, Vanadium, Gallium, Selenium, Tissue, Sensitivity.

A method of obtaining high sensitivity and accuracy in X-ray fluorescence analysis using semiconductor detector spectrometers is discussed. Monoenergetic exciting radiation is employed to generate characteristic X-rays from trace elements in thin, uniform specimens. Corrections for absorption effects are determined; enhancement effects are omitted as they are negligible for many thin specimens. A single element thin-film standard is used to calibrate for the X-ray geometry, and theoretical cross sections and fluorescent yield data are employed to relate the X-ray yields for a wide range of elements to the thin-film standard. Various corrections which affect the accuracy of the method are discussed including the method for determining X-ray spectral background. Samples of orchard leaves, tissue, blood, and other biological materials are prepared for analysis by freeze- or oven-drying, pulverizing, and pressing into pellets. Rock, glass, and pottery specimens are prepared by pulverizing, collecting on thin filters, and transferring the dust to Millipore filters. Elements in solution are absorbed on cellulose powder, dried, pulverized, and pressed into pellets. Elements in air can be analyzed directly from filter papers. Samples of orchard leaves, rocks, pottery, and air particulate filters were analyzed for metals including Cr, Mn, Fe, Ni, Cu, Zn, As, Br, Rb, Sr, Pb, K, Ca, Ti, V, Ga, and Se. Using a single excitation energy, the concentrations of more than fifteen trace elements may be simultaneously determined during a fifteen-minute interval for concentrations of 1 ppm or less. (Little-Battelle)

SEPARATION AND CHARACTERIZATION OF DIMETHYLNITROBIPHENYL AND DIMETHYLBIPHENYLAMINE ISOMERS BY CHROMATOGRAPHIC AND SPECTROMETRIC METHODS,
Baylor Coll. of Medicine, Houston, Tex. Inst. for Lipid Research.
P. A. Dudley, M. W. Noall, and D. M. Desiderio.
Analytical Chemistry, Vol 45, No 4, p 703-706, April 1973. 4 fig, 12 ref.

Descriptors: *Separation techniques, *Infrared radiation, *Ultraviolet radiation.
Identifiers: Characterization, *GC-mass spectrometry, *Sample preparation, *Isomers, Dimethylbiphenyls, Dimethylbiphenylamines, Infrared spectra, Ultraviolet spectra, Partitioning, Chromatograms, 2' 3-Dimethyl-4-nitrobiphenyl, 3 3'-Dimethyl-4-biphenylamine, 2' 3-Dimethyl-4-biphenylamine, 2' 3-Dimethylbiphenyl.

Diazotized 4-nitro-m-toluidine when coupled with toluene yields a mixture of dimethyl positional isomers of 2'-,3'-, or 4'-dimethyl-4-nitrobiphenyl. The 2',3-dimethyl-4-nitrobiphenyl isomer is of interest as a precursor for the carcinogen 2',3-dimethyl-4-diphenylamine and the related hyroxamic acid. The 2',3-dimethyl-4-nitro isomer is separated on a preparative scale from the 3,3'- and 3,4'-dimethyl isomers in a cyclohexane-heptane-nitromethane liquid-liquid partition chromatography system. The chromatographic system resolved 2',3-dimethyl-4-biphenylamine from the two corresponding dimethylamine isomers and from the nitro compounds. The 2',3-dimethylnitro or amine isomers may be analyzed by GLC on a 4-mm x 5-foot column of 2 percent OV-17 on Gas Chrom P. The methyl positional isomers of the nitro and amine compounds and their corresponding hydrocarbons have been characterized and compared to reference hydrocarbons by mass spectrometry. The 2',3-dimethyl nitro and amine compounds are additionally characterized by physical constants, IR, and UV spectral data. (Little-Battelle)

TRACE ELEMENT ANALYSIS IN WATER BY PROTON ACTIVATION,
California Univ., Davis. Dept. of Applied Science.
S. F. Bankert, S. D. Bloom, and G. D. Sauter.
Analytical Chemistry, Vol 45, No 4, p 692-697, April 1973. 9 fig, 3 tab, 6 ref.

Descriptors: *Water analysis, Nitrogen, Bromine, Boron, Cadmium, Chromium, Sodium, Evaporation, Calibrations, Instrumentation, Laboratory equipment, *Trace elements.
Identifiers: *Sample preparation, *Proton activation analysis, Selenium, Detection limits, Sensitivity.

LIBRARY OF L. URBANA-CHAMPAIGN

Charged particle activation analysis (CPAA) has been applied to the measurement of trace amounts of pollutants in calibrated water samples. The activating particles are 14.7 MeV protons in a microampere (or less) beam from the Lawrence Livermore Laboratory 30-inch cyclotron. The short half-live gamma spectrum of the activated sample is assayed in a Nal-Ge (Li) anticoincidence detector system. A fast transit system carries the sample from the bombardment site to the counting position in about 1.8 seconds. As of now, the technique is capable of simultaneously detecting ppm quantities of boron, nitrogen, bromine, selenium, sodium, cadmium, and chromium in concentrated water samples evaporated to dryness on tantalum foils. However, it is applicable to any thin sample which can be fixed to a foil. (Little-Battelle)
W73-11033

ON-THE-FLY GAS CHROMATOGRAPHY-INFRARED SPECTROMETRY USING A CHOLESTERIC LIQUID CRYSTAL-EFFLUENT INTERFACE,
Hunter Coll., New York. Dept. of Chemistry.
J. O. Lephardt, and B. J. Bulkin.
Analytical Chemistry, Vol 45, No 4, p 706-710, April 1973. 9 fig, 4 ref.

Descriptors: *Gas chromatography, *Organic compounds, Pollutant identification.
Identifiers: Toluene, Chloroform, 1 2-dichloroethane, Carbon tetrachloride, Nitrobenzene, m-Chloroaniline, o-Toluidine, p-Chloroaniline, N N-dimethylaniline, *GC-Infrared spectrometry, Infrared spectra, Cholesteric liquid crystals, On-the-fly gas chromatography.

A GCIR system is described which combines the features of trapping and on-the-fly techniques. The heart of the system is a cholesteric liquid crystal film. The system was used to obtain infrared spectra of toluene, chloroform, 1,2-dichloroethane, carbon tetrachloride, nitrobenzene, m-chloroaniline, o-toluidine, o-chloroaniline, and n,n-dimethylaniline. On-the-fly IR specrra of organic vapors can be obtained with quantities as small as 50 micrograms. The liquid crystal fractionates sample from carrier gas. The technique yields spectra which are solution rather than gas phase spectra, eliminating problems of rotational structure and vapor-liquid frequency shifts. The system can also be used for on-the-fly spectra of organic vapors in an air stream, with comparable efficiency. Color shifts occurring on adsorption and desorption of the effluents onto the liquid crystal film can be monitored to trigger infrared scanning and eliminate delay time errors associated with gas cell operation. The range of the system can be extended by changing the carrier gas to effluent ratio for high boiling materials. (Little-Battelle)

THE USE OF GAS-LIQUID CHROMATOGRAPHY FOR SELECTING EXTRACTIVE SOLVENTS FOR LIQUID EXTRACTION PROCESSES,
Z. I. Abramovich, M. F. Bondarenko, E. A. Kruglov, R. M. Masagutov, and M. A. Pais.
Journal of Chromatography, Vol 77, No 1, p 37-40, March 14, 1973. 1 tab, 10 ref.

Descriptors: *Solvent extractions, *Selectivity, *Separation techniques, Phenols, Alcohols, Nitrogen compounds, Sulfur compounds, Organic compounds.
Identifiers: *Gas liquid chromatography, *Organic solvents, Esters, Aromatic hydrocarbons, Thiophane, o-Cresol, Diisopropyl sulfide, n-Octane, 2-Methyl thiophene, Toluene, Kerosene, Gas oil, m-Cresol, p-Cresol, o-Chlorophenol, Ethylene glycol, Triethylene glycol, Benzyl alcohol, Furfuryl alcohol, Propylene carbonate, Dimethyl malonate, Diethyl oxalate, Diisopropyl malonate, Formamide, Ethyl carbamate, Aniline, Dimethylaniline, Nitrobenzene, Benzonitrile, 1-Nitro-2-methylpropanol-2, N-Methylpyrrolidone, Dimethyl sulfoxide, Sulpholane, Acetylthiophene, Furfural, Maleic anhydride, n-Tetradecane, alpha-Methylnaphthalene.

Gas-liquid chromatography has been used to investigate the group selectivity of 28 solvents in the separation of cyclic and aliphatic sulfides from the hydrocarbons. The solvents containing -OH and -NH2 groups were the most selective in separating the cyclic sulfides and monocyclic aromatic hydrocarbons. The data obtained allowed an extractive solvent (phenol) to be chosen for separating the cyclic sulfides from the kerosene-gas-oil fractions. With the straignt-run petroleum fraction 275-350 degrees the possibility of obtaining the sulfide concentrates with the help of liquid extraction was experimentally confirmed. (Holoman-Battelle)

SOME OBSERVATIONS ON STANDARD MERCURY SOLUTIONS FOR ATOMIC ASBORPTION SPECTROSCOPY,
Tohoku Univ., Sendai (Japan). Dept. of Applied Chemistry.
T. Odashima, and Y. Kumagai.
Atomic Absorption Newsletter, Vol 12, No 2, p 39, March-April 1973. 2 fig, 2 ref.

Descriptors: *Mercury, Heavy metals, Absorption, Pollutant identification.
Identifiers: *Atomic absorption spectrophotometry, *Standard solutions, *Mercury nitrate, *Mercury chloride, Chemical interference.

Measurements made with a Hitachi Model 207 atomic absorption spectrometer showed that the atomic absorption of mercury at 254 nm in air-acetylene flames is greatly influenced by certain types of standard mercury (II) solutions. When mercury (II) chloride was used for standard solutions, rectangular absorption peaks were obtained, but when mercury (II) nitrate was used, there was tailing of the peaks. The tailing effect can be eliminated by adding sufficient quantities of halides such as KCl, KBr, KSCN, or KI. (Little-Battelle)

SELECTIVE DETERMINATION OF HETERO--ORGANICS BY A DUAL-CHANNEL DETECTOR BASED ON FLAME CONDUCTIVITY AND EMISSION,
Missouri Univ., Columbia. Dept. of Agricultural Chemistry.
W. A. Aue, and H. H. Hill, Jr.
Analytical Chemistry, Vol 45, No 4, p 729-732, April 1973. 2 fig, 1 tab, 5 ref.

Descriptors: Iron, Lead, Tin, *Phosphorus, *Sulfur, *Carbon, *Gas chromatography, Laboratory equipment, *Metals.
Identifiers: *Flame ionization detector, Detection limits, Dodecane, Trimethylphosphate, Di-n-butyl-disulfide, Tetraethyl lead, Tetraethyl tin, Ferrocene, Biological samples, Environmental samples.

A simple dual-channel detector was constructed from a regular FID and a spectrometer and used to study ionization and emission processes occurring in hydrogen flames. The response of the system was tested with dodecane, trimethyl-phosphate, di-n-butyl-disulfide, tetraethyl lead, tetraethyl tin and ferrocene under air-rich and hydrogen-rich conditions. The results showed that both emission and ionization responses can be used to determine the metals in the nanogram and picogram ranges, respectively; while the response to carbon is repressed by several orders of magnitude. The method should prove useful for biological and environmental samples. (Little-Battelle)

Analytical Chemistry, Vol 45, No 4, p 790-792, April 1973. 2 fig, 2 tab, 13 ref.

Descriptors: *Fabrication, Physical properties, *Aqueous solutions, *Selectivity, *Electrodes, Research equipment, Pollutant identification, Antibiotics (Pesticides), Chemical reactions, Methodology, Laboratory equipment, Bactericides, Hydrogen ion concentration, Enzymes, Temperature.
Identifiers: *Penicillinase, Enzyme electrodes, Penicillin, *Penicillin enzyme electrode, Membrane electrodes, Substrate concentration, Detection limits, Response time, Specificity, Sodium ampicillin, Sodium nafcillin monohydrate, Potassium penicillin G, Potassium penicillin V, Potassium cyclicillin, Sodium dicloxacillin monohydrate, Drugs, Penicilloic acid, Ion selective electrodes.

An enzyme electrode has been developed which utilizes penicillin beta-lactamase (penicillinase) and is responsive to intact penicillin. The electrode is prepared by immobilizing the penicillinase in a thin membrane of polyactylamide gel molded around and in intimate contact with a hydrogen ion glass electrode. When this electrode is exposed to an aqueous solution of penicillin adjusted to a pH of 6.4, and immobilized enzyme hydrolyzes the penicillin to produce the corresponding penicilloic acid. The increase in hydrogen ion concentration from the penicilloic acid is sensed by the glass electrode and a potentiometric response is recorded. This electrode is analytically useful in the penicillin concentration range of 0.0001-0.05 M. The response time is dependent upon the age of the electrode, with the typical response time being 15-30 sec. pH affects the solubility and stability of penicillin, and the reactivity of penicillinase. The electrode was most sensitive and responsive at pH 6-7. If the electrode is prepared as recommended, (1) there is enough penicillinase to react with more than 0.5 mole of a penicillin; and (2) the electrode will function in an acceptable manner for up to 2 weeks making possible a hundred or more measurements. X-RAY MICRODETERMINATION OF CHROMIUM, COBALT, COPPER, MERCURY, NICKEL, AND ZINC IN WATER USING ELECTROCHEMICAL PRECONCENTRATON,
Seton Hall Univ., South Orange, N.J. Dept. of Chemistry.
B. H. Vassos, R. F. Hirsch, and H. Letterman.
Analytical Chemistry, Vol 45, No 4, p 792-794, April 1973. 2 fig, 1 tab, 11 ref.

Descriptors: *X-ray fluorescence, *Aqueous solutions, *Water analysis, Copper, Mercury, Zinc, Nickel, Cobalt, Chromium, Separation techniques, *Heavy metals, Electrodes.
Identifiers: *Electrodeposition, *Sensitivity, *Metal ions, Preconcentration, Sample preparation, Detection limits, Chemical interference, Errors, Precision, Pyrolytic graphite electrodes.

The sensitivity of x-ray fluorescence for the analysis of metal ions in aqueous solutions can be improved by preconcentration of the solution. A preconcentration procedure has been developed which consists of electrodeposition of the metals to be determined onto a pyrolytic graphite electrode. This separates the reducible metal ions from the dilute solution into a form particularly suitable for analysis by x-ray fluorescence. After deposition, a thin dish is cleaved from the electrode surface and analyzed. The method has been evaluated by analysis of Cu, Hg, Zn, Ni, Co, and Cr in solutions of low electrolyte concentration (approximately fresh water) and with conventional levels of supporting electrolyte. By the criterion of 'total error', all the results fall into the 'excellent' category except for the Cr results which are 'acceptable'. It is concluded that the method is useful for ppm determinations of the metals studied, is amenable to improved sensitivity, and can be modified for analysis of additional metal ions. (Little-Battelle)
W73-11043

IDENTIFICATION OF HEAVIER AROMATIC COMPONENTS IN REFORMED PETROLEUM PRODUCTS BY DIRECT COUPLED CAPILLARY GAS CHROMATOGRAPHY-MASS SPECTROMETRY,
Gulf Research and Development Co., Pittsburgh, Pa. Pennsylvania.
J. T. Swansiger, and F. E. Dickson.
Analytical Chemistry, Vol 45, No 4, p 811-813, April 1973. 2 fig, 2 tab, 13 ref.

Descriptors: Organic compounds, *Mass spectrometry, *Gas chromatography, *Aromatic compounds.
Identifiers: *Reformates, *GC-mass spectrometry, Boiling point, Gasoline, Kerosene, *Oil characterization, Chromatograms, Petroleum products, Benzene, Methyl diethyl benzene, Naphthalene.

The objective was to identify as many components in the C10 and heavier range of reformed petroleum products and to utilize to the fullest extent possible the capabilities of the mass spectrometric interface in identifying the capillary GC peaks. It was possible to isolate the C10-C11 fractions from a typical reformate and the C11-C14 fraction from an alkylated reformate. The major peaks appearing in the capillary GC of the C10-C11 cut (21 peaks) were identifiedand 95 percent (13 peaks) in the C11-C14 fraction were identified. The C10-C11 fraction was isolated by preparative gas chromatography using a 5-1/2 ft column packed with OV-1 on Chromosorb P. This fraction was injected into a 200 ft column with (m-phenoxy, phenoxy) benzene/squalane and programmed from 50 to 90C at 1C per minute. The C11-C14 fraction was isolated by distillation of components boiling above 187 C. The distillate was injected in a 150-ft column coated with polyphenyl ether and programmed from 50 to 160 C at 5 C per minute. Mass spectra were obtained at 70 eV with an ionizing current of 150 micro amps. The GC peaks were scanned at 2 sec per decade for the C10-C11 fraction and 4 sec per decade for the C11-C14 decade. The chromatograms, formulas, compound names, and boiling points of the fractions are listed. (Little-Battelle)

SPECTROPHOTOMETRIC DETERMINATION OF SULFATE ION WITH BARIUM IODATE AND THE LINEAR STARCH IODINE SYSTEM,
Sam Houston State Univ., Huntsville, Tex. Dept. of Chemistry.
W. L. Hinze, and R. E. Humphrey.
Analytical Chemistry, Vol 45, No 4, p 814-815, April 1973. 2 tab, 12 ref.

Descriptors: *Aqueous solutions, *Sulfates, *Spectrophotometry, Ions, *Ion exchange, Bicarbonates, Sulfites, Bromides, Chlorides, Nitrates, Alkalis (Bases), Absorbance.
Identifiers: *Sample preparation, *Detection limits, Chemical interference, Recovery, Borates.

A spectrophotometric method has been developed for the determination of sulfate ions in the low ppm range which involves an ion-exchange reaction with a slightly soluble sulfate and release of an absorbing anion into the solution. Barium iodate and linear starch iodide were used in solutions of sodium sulfate. Two dilution procedures were used to cover larger ranges of concentrations. Sulfate ions were measured over the range of 1-4 ppm with a lower dilution, and the effective molar absorptivity for sulfate was 31,000. With a higher dilution, the range was 4-14 ppm and the molar absorptivity was 9400. Color reactions were stable and the results were reasonably reproducible. A very limited study of interferences showed that bicarbonate, borate, hydroxide, and sulfite ions could not be tolerated while bromide, chloride, and nitrate ions had no effect. Results with barium iodate compare favorably with those from the chloroanilate method. (Little-Battelle)

METHOD FOR EXPOSING BACTERIAL CULTURES ON SOLID MEDIA TO A DEFINED GAS MIXTURE USING NYLON BAGS,
Agricultural Research Council, Brighton (England). Unit of Nitrogen Fixation.
S. Hill.
Laboratory Practice, Vol 22, No 3, p 193, March 1973. 1 fig, 4 ref.

Descriptors: *Cultures, *Bacteria, Methodology, *Gases, *Anaerobic bacteria, Oxygen, Nitrogen, Laboratory equipment.
Identifiers: *Mixtures, Derxia gummosa, Clostridium pasteurianum, Desulfovibrio desulfuricans, Nylon bags, Growth media, Culture media.

In order to avoid any alteration of bacterial growth, a method has been devised for using nylon bags in the exposure of bacterial cultures on solid media to a defined gas mixture. The bags ensure a constant gas composition throughout the incubation period. Large numbers of cultures can easily be handled and growth can be observed without exposing the cultures to air. A description is given of the apparatus which has been used successfully for investigating the effect of 02 concentration on colony formation of Derxia gummosa grown on solid N-free media (Hill, 1971). The obligate anaerobes Clostridium pasteurianum and Desulfovibrio desulfuricans have been grown on solid media in nylon bags: Clostridium pasteurianum on thioglycollate medium (Oxoid Ltd, England) under N2 plus 1 percent CO2 and Desulfovibrio desulfuricans on Baars's medium (Pankhurst, 1966) under N2. THE EXTRACTION OF DIVALENT COBALT, COPPER, ZINC AND CADMIUM FROM HYDROCHLORIC ACID SOLUTIONS BY TRI--N-BUTYL PHOSPHATE,
Shizuoka Univ., Hamamatsu (Japan). Dept. of Applied Chemistry.
T. Sato.
Journal of Applied Chemistry and Biotechnology, Vol 22, No 12, p 1233-1242, December 1972. 4 fig, 4 tab, 24 ref.

Descriptors: *Cations, *Cobalt, *Copper, *Zinc, *Cadmium, *Solvent extractions, *Aqueous solutions, Heavy metals, Separation techniques, Efficiencies, Phosphates, Acids.
Identifiers: Tri-n-butyl phosphate, Organic solvents, Chemical indicators, EDTA, Xylenol orange, Infrared spectra, Absorption spectra, Hydrochloric acid, Benzene, Kerosene.

The partition of divalent cobalt, copper, zinc, and cadmium between hydrochloric acid solutions and solutions of tri-n-butyl phosphate (TBP) in benzene or kerosene has been investigated under different conditions. Further the absorption spectra of both the aqueous and organic phases have been studied, and the infrared spectra or the organic phases have been examined. The order of the extraction efficiency of TBP for divalent metals is Zn greater than Cd greater than Cu greater than Co for aqueous HC1 less than 8 M and Zn greater than Cd greater than Co greater than Cu for aqueous HC1 greater than 8 M. MICROBIAL CHANGES AND POSSIBLE GROUND WATER POLLUTION FROM POULTRY MANURE AND BEEF CATTLE FEEDLOTS IN GEORGIA,
Georgia Univ., Athens. Dept. of Agronomy.
J. Giddens, A. M. Rao, and H. W. Fordham.
Available from the National Technical Information Service as PB-220 956, $3.00 in paper copy, $0.95 in microfiche. Environmental Resources Center, Georgia Institute of Technology, Atlanta Report ERC-0573, May 1973, 57 p, 14 fig, 16 tab, 6 ref. OWRR A-031-GA (1). 14-31-0001-3210.

Descriptors: *Farm wastes, Confinement pens, *Feed lots, *Fertilizers, Soil microbiology, *Nitrates, *Poultry, *Coliforms, Water pollution sources, *Georgia, *Microbial degradation, Path of pollutants.

Laboratory and field studies were used to determine the effect of methods of application and handling poultry manure upon nitrate and other nutrients in the soil and upon microbial changes during decomposition. Among the findings: one-half the nitrogen in poultry manure volatilizes upon air-drying. Repeated light applications of manure produce less soil nitrate (ground water pollution) than fewer heavy applications totaling the same amount, and applications on the soil surface produce less nitrate than do those incorporated into the soil. Coliform bacteria decrease rapidly when manure is worked into the soil or exposed to the ammonia produced in the manure. Soil fungi decrease during early manure decomposition stages. Coliforms reach high levels in nearby ponds after rainfall periods. Soil surveys at 21 beef cattle feedlots also indicate that contamination from surface runoff is a much greater pollution hazard than ground water contamination. Ground water contamination is minimized by allowing the manure to volatilize at the soil surface. (James-Geo Tech)

THE ORIGIN, EFFECTS AND CONTROL OF TURBIDITY IN AN URBAN RECREATIONAL LAKE,
Massachusetts Univ., Amherst. Water Resources Research Center.
C. Carranza, and S. M. Bemben.
Available from the National Technical Information Service as PB-220 963, $5.45 in paper copy, $0.95 in microfiche. Completion Report FY73-5, February 1973. 106 p, 17 fig, 3 tab, 8 photo, 60 ref. OWRR A-037-MASS (1).

Descriptors: *Urbanization, *Turbidity, Recreation wastes, Pollution, *Massachusetts, Storm water, Color, Suspended solids, Suspended load, Dissolved solids, Ions, Bottom sediments, Water pollution sources.
Identifiers: *Chicopee (Mass), Lake Pollution, Storm water pollution, Street pollution, *Mountain Lake (Mass), Dissolved ions.

'State of the art' is described of the water quality parameter known as turbidity, particularly with regard to the effects of urbanization on a recreational water body. Field and laboratory data are presented which support a new broader definition for the parameter. For the general case, it is shown that turbidity is a composite parameter which is well related to apparent color, suspended solids concentrations, dissolved ion concentrations and the optical properties of suspended solids. The traditional relationships to B.O.D., D.O., CO2, total hardness, alkalinity, and pH are not challenged but rather are augmented. For the specific field case considered, it is shown that the degree of turbidity is related to the character and degree of urbanization, the natural geologic setting and the weather conditions.

INFLUENCE OF NA3NTA AND NA4 EDTA UPON THE ACTIVATION OF METALS IN RIVER AND LAKE SEDIMENTS IN MICHIGAN,
Michigan State Univ., East Lansing. Dept. of Crop and Soil Sciences.
B. D. Knezek, L. M. Mugwira, and B. G. Ellis.
Available from the National Technical Information Service as PB-220 950, $3.00 in paper copy, $0.95 in microfiche. Project Completion Report, Michigan Institute of Water Research, May 1973, 26 p, 4 fig, 13 tab. OWRR A-043-MICH (1). 14-31-0001-3222.

Descriptors: *Chelation, *Phosphorus, Detergents, *Michigan, Lakes, Lake sediments, *Nitrilotriacetic acid, Rivers, *Metals, *Bottom sediments.
Identifiers: Red Cedar River (Mich), Grand River (Mich), *EDTA, Chelating agents.

Bottom sediments were collected from the Red Cedar River, above and below the watewater discharge of a metal workings plant, from the Grand River, above and below the sewage disposal discharge of the City of Grand Rapids, Michigan, and from six lakes for metal activation studies. These sediments were equilibrated with O, 10 to the minus 6th power, 10 to the minus 5th power and 10 to the minus 4 power, M Na3NTA and Na4EDTA for 1, 3, 6, 9 and 14 days and Grand Rapids sewage sludge was equilibrated with these solutions for one day to determine the amount of metals solubilized. Trisodium NTA and Na4EDTA at concentrations of 10 to the minus 5th power M and 10 to the minus 4th power M solubilized significant amounts of Ni and Zn, but only from sediments contaminated with high amounts of these metals. The percentages of the metals extracted indicated that Na3NTA was most effective in solubilizing Ni and Na4EDTA was most effective in solubilizing Zn. With sediments low in total Ni and Zn both chelates tended to solubilize more Fe and Cu. The amounts of Fe and Cu extracted, however, were minute when compared to Ni and Zn solubilized. In general Na3NTA and Na4EDTA did not influence the removal of Ca, Mg, Mn, or Cr from the river or lake bottom sediments even though total metal contents of these elements were often high. The amount of metal solubilization from sediments due to chelation with Na3NTA was not great enough to be a probable environmental threat under the conditions investigated.

INFLUENCE OF VEGETATION AND SUBSTRATE ON STREAMWATER CHEMISTRY IN NORTHERN UTAH,
Utah Center for Water Resources Research, Logan.
G. E. Hart, A. R. Southard, and J. S. Williams.
Available from the National Technical Information Service as PB-220 954, $3.00 in paper copy, $0.95 in microfiche. Completion Report April 1973. 53 p, 9 fig, 20 tab, 8 ref. OWRR A-007-UTAH (2). 14-31-0001-3545.

Descriptors: *Chemistry of precipitation, *Throughfall, Trees, Water chemistry, Nutrients, *Utah, *Douglas fir trees, *Juniper trees, Geology, *Nutrient analysis, Drainage.
Identifiers: Nutrient budget.

Chemical composition of precipitation, of throughfall under Douglas fir and under juniper trees, and of streamwater from two mountain-brush drainages in northern Utah were monitored for two years, Elements examined were sodium, calcium, magnesium, potassium, phosphorus, nitrate nitrogen, conductive, and acidity. Precipitation chemistry was somewhat greater than values reported for other regions and displayed an increase in concentrations in spring and summer. This increase is attributed to dry fallout of dust produced by agricultural activities or from dry salt flats upwind of the area. Concentration of cations were from 3 to 16 times greater under trees than in open precipitation. Large percentage increases were observed in throughfall for phosphorus and nitrate nitrogen, although absolute values reamined rather low (about 4 ppm and 5 ppm, respectively). Douglas-fir consistently yielded higher concentrations in throughfall than did juniper, due probably to differences in canopy area and growth form. Analyses of streamwater showed concentrations of sodium and magnesium that were about in proportion to the percentage of calcareous bedrock (limestone or dolomite) in the two drainages. Nutrient budgets for this locality show a net loss of 40 to 100 lbs/acre/yr of calcium and 20 to 40 lbs/acre/yr of magnesium. Inputs and outputs of sodium and potassium were about in balance while the input of nitrates was three times greater than output.

DEEP WATER RENEWAL IN SAANICH INLET, AN INTERMITTENTLY ANOXIC BASIN,
Washington Univ., Seattle. Dept. of Oceanography,
J. J. Anderson, and A. H. Devol.
Estuarine and Coastal Marine Science, Vol 1, No 1, p 1-10, January 1973. 6 fig, 1 tab, 10 ref. NSF Grant GA-10084.

Descriptors: *Water circulation, *Density stratification, *Fjords, *Water chemistry, Dissolved oxygen, Sulfates, Sulfides, Nitrates, Density currents.
Identifiers: *Saanich Inlet (B C).

Saanich Inlet is a fjord on the southeast side of Vancouver Island. Its shallow sill is approximately 70 m deep and its inside depth averages 236 m. Its bathymetry and a strong vertical pycnocline isolate the deep water, resulting in drastic changes in the chemical composition. The changes are initiated by biochemical processes reducing the oxygen concentration of the isolated deep water to a level where aerobic respiration is no longer favored. Organic matter is then oxidized by nitrate-reducing bacteria. Finally, when the nitrate concentration of the deep water reaches zero, or nearly so, sulfate reduction begins; sulfate becomes the terminal electron acceptor for the oxidation of organic matter and hydrogen sulfide is produced. Because of these processes, the deep waters of the fjord are frequently devoid of oxygen and nitrate and contain significant amounts of hydrogen sulfide in the spring and summer. In late summer or early fall, dense, oxygenated water reaches the sill of Saanich Inlet from Haro Strait and flows down into the basin, displacing the resident deep water. Renewals equivalent to 64% and 33% of the deepwater volume, calculated from nitrate budgets, occurred in 1962 and in 1969. The time for 37% renewal of the deep water was estimated to be about 12 days. (Knapp-USGS)

WATER QUALITY DETERMINATIONS IN THE VIRGIN ISLANDS FROM ERTS-A DATA,
Grumman Aerospace Corp., Bethpage, N.Y. Research Dept.
W. Egan.
Available from NTIS, Springfield, Va. 22151. AD-754 009. Price $3.00 printed copy; $0.95 microfiche. Research Department Memorandum RM-561J, December 1972. 24 p, 13 fig, 7 tab, 9 ref.

Descriptors: *Water quality, *Remote sensing, *Aerial photography, *Virgin Islands, Water pollution sources, Sedimentation, Waste disposal, Thermal pollution, Analytical techniques, Aircraft.

Identifiers: *Charlotte Amalie Harbor (V I), *St. Thomas (V I), Aircraft imagery, Color photography, ERTS-A.

The harbor at Charlotte Amalie on St Thomas, Virgin Islands, has a concentration of many factors affecting water quality: untreated sewage effluent, sediment from navigation and dredging operations, runoff from a garbage dump, and hot effluent from a desalination/power plant. Imagery from ERTS-A in association with aircraft imagery and ground truthing permits the characterization of water quality in terms of absolute color values. This necessitates the establishment of photometric standards resolvable by the ERTS-A sensors in order that atmospheric effects, which generally vary on sequential overpasses, may be determined and subtracted. The overall program is described together with typical numerical results. (Woodard-USGS)

TRACER SIMULATION STUDY OF POTENTIAL SOLUTE MOVEMENT IN PORT ROYAL SOUND, SOUTH CAROLINA,
Geological Survey, Washington, D.C.
F. A. Kilpatrick, and T. R. Cummings.
For sale by GPO, Washington, D.C. 20402 Price $0.55. Geological Survey Water-Supply Paper 1586-J, 1972. 27 p, 18 fig, 1 tab, 9 ref.

Descriptors: *Tracers, *Path of pollutants, *Dye releases, *Sounds, *South Carolina, Estuaries, Bays, Fluorescent dye, Sampling.
Identifiers: *Port Royal Sound (SC).

A tracer study was conducted in Port Royal Sound, South Carolina, to simulate the movement and ultimate pattern of concentration of a solute continuously injected into the flow. A total of 750 pounds of Rhodamine WT dye was injected by boat during a period of 24.8 hours in a line across the Colleton River. During the following 43 days, samples of water were taken in the sound, and the concentration of dye in the samples was determined by fluorometric analysis. The data obtained in the field study were used with theoretical models to compute the ultimate pattern of concentration of nonconservative and conservative solutes for a hypothetical continuous injection at the site on the Colleton River. Available from the National Technical Information Service as COM-72-11123, $3.00 in paper copy, $0.95 in microfiche. Sea Grant Publication No. USC-SG-4-71, December 1971. 59 p, 14 fig, 13 ref.

Descriptors: Water quality, Water pollution sources, Storm water, *Heavy metals, *Sediments, *Chlorinated hydrocarbon pesticides, *Sea water, Water analysis, Storm runoff, Lead, Cadmium, Mercury, Manganese, Iron, Dissolved oxygen, Hydrogen ion concentration, Gas chromatography, Sampling, Turbidity, Salinity, Benthos, Water temperature, Hydrogen sulfide, Organic matter, Detritus, Colorimetry, Alkalinity, Carbon, 2 4-D, 2 4 5-T, Endrin, Heptachlor, DDE, DDT, Aldrin, Coasts, *California.
Identifiers: Sample preparation, Preconcentration, *Atomic absorption spectrophotometry, *Electron capture gas chromatography, Species diversity, *Marina del Rey (Calif), Antimony, Settleable solids, Secchi disks, Total solids, Parathion, PCNB, Telodran, Dyrene, Heptachlor epoxide, Lindane, Neburon, Hexachlor benzene, Methyl ester 2 4-D, Ethyl hexyl ester 2 4-D, BHC, Chlordane, Toxaphene, o p' DDT, Dichlone, Diuron, p p' DDE.

The Marina del Rey boat harbor of southern California was studied to determine the current environmental conditions of the marina and the potential sources of contamination form the surrounding environment. Storm water and water from the marina were analyzed for clarity by Secchi disk, for temperature using a portable DO-temperature meter, for salinity using a conductivity meter, for turbidity by the Jackson Candle Method, and for hydrogen sulfide by colorimetry. Storm water and water and sediments from the marina were also analyzed for chlorinated hydrocarbons by electron capture GC and for metals (Cd, Pb, Hg, Mn, Fe, Sb) by AA. The extraction and preconcentration techniques are described. The following general conclusions were drawn: (1) The measurements of the dissolved oxygen, pH, alkalinity, turbidity and salinity show that the environmental variables of the Marina are within satisfactory levels. (2) The biological indices such as diversity and density of benthic life are very low in the Marina. (3) The quality of storm water is considered to be relatively harmless to the water quality of the Marina. (4) Chlorinated hydrocarbons are largely absent in storm water and in water samples of the Marina. However, in some locations of sediment, significant amounts of chlorinated pesticides have been detected. (5) Higher than normal concentrations of lead in both the Marina and storm water samples probably stem from automobile and marine exhausts. (6) Concentrations of heavy metals such as mercury and cadmium are generally low in water samples. However, significant accumulations in sediment have been detected. (7) Accumulation of sediment from storm waters is significant. (8) Debris from Ballona Creek in the breakwater region appear to affect the bottom conditions of the Marina. (Little-Battelle)

MULTI-SENSOR DETECTION AND TRACKING OF CONTROLLED OIL SPILLS,
Spectran, Inc., Hollywood, Calif. Microwave Sensor Systems Div.
J. C. Aukland, J. D. Sohn, and L. E. Rasmussen.
Available from the National Technical Information Service as AD-741 953, $3.00 in paper copy, $0.95 in microfiche. Final Report, May 1971. 138 p, 62 fig, 9 tab. Contract No. DOT-CG-11996-A.

Descriptors: *Oil spills, *Remote sensing, *Aerial photography, *Infrared radiation, *Ultraviolet radiation, Pollutant identification, Oil, Analytical techniques, Oil pollution, Equipment, Data processing, Ocean waves, *California.
Identifiers: *Microwave radiometers, Crude oil, No. 2 fuel oil, No. 6 fuel oil, Infrared scanners, Cameras, Sensors, Fuel oil, Radiometry, Radiometers, Multispectral sensing system.

Airborne remote sensing of controlled oil spills was carried out off the Coast of California during December 1970 and January 1971. The pollutants investigated were number 2 fuel oil, number 6 fuel oil, light crude oil, and heavy crude oil. All spills were made at a ships speed of 15 knots with spill rates of 0.5, 1.0, 2.5, and 5.0 GPM. All spills were made in at least three separate sea states, ranging from flat, zero sea-states to sea-states of 3 or greater with high wind velocities. The sensors used included two dual polarized microwave radiometers operating at 10.2 GHz and 30 GHz, an infrared scanner operating in the 8-14 micron region, and a 4-lens camera employing filters in the visible and the ultraviolet wavelengths. The purpose was to obtain information on detecting oil on the sea's surface and to compare this with other data. From this information recommendations were made for equipments and design parameters for an all-weather system. On the basis of this experiment and previous experiments on controlled oil spills, it is recommended that the primary sensing device be an 8-14 micron infrared scanner backed-up by a 35 GHz scanning microwave radiometer to provide all-weather capabilities. Documentation to analyze the quantity and types of oil spilled should be taken by a dual camera system operating in the .36-.4 micron region and the .6-.7 micron region. A control station is required in which the operator can view the scene prior to photographing and to record that information on video tape as well as photographic film. All of the proposed sensors are presently available and may be integrated into an all-weather pollution surveillance system without further development. Additional photographic data should be gathered on various controlled and accidental spills to increase the experience factor in oil rate identification. (Little-Battelle)

Identifiers: *Gas liquid chromatography, Persistence, *Parathion chemical, Recovery, Aminoparathion, Sample preparation.

LIBRARY OF U. URBANA-CHAMPAIGN

Six California soils, Mocho silt loam, Linne clay, Madera sandy loam, Laveen loamy sand, Windy loam, and Santa Lucia silt loam, were contaminated with parathion with moisture contents of 40 percent saturation or simulated flooding to investigate parathion persistence. The samples were kept in enameled trays fitted with glass covers for periods up to 8 months. Samples were extracted by adding a benzene-acetone mixture, repeated shaking, decanting the supernatant onto a column of sodium sulfate and collecting the eluate. The recovery of parathion was 95-101 percent. The extracts were analyzed by GLC using an alkali flame ionization phosphorus detector and columns (1.52 m x 3.2 mm o.d.) packed with 10 percent OF-101 on 80/100 mesh Gas Chrom Q for parathion in the presence of aminoparathion or a mixture of 15 percent DC-200 and 15 percent QF-1 separately coated on Gas Chrom Q for aminoparathion. The studies show that most parathion applied to soils disappears rapidly but low levels are retained for long periods. The persistence of parathion is partially dependent on soil type. In Mocho silt loam, Linne clay, Madera sandy loam, and Laveen loamy sand, degradation is rapid and is attributed to a combination of hydrolysis and strong microbial activity that overshadows differences in soil type. In contrast, loss from Santa Lucia silt loam and Windy loam soils is slow and is attributed to hydrolysis. The organic matter contents of the six soils correlate well with the parathion persistence. Parathion disappears faster in the soils with lower organic matter. Parathion degradation did not appear to be greatly accelerated by flooding. (Little-Battelle)

UPTAKE AND BIOTRANSFORMATION OF PHENYLMERCURIC ACETATE BY AQUATIC ORGANISMS,
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
S. C. Fang.
Archives of Environmental Contamination and Teoxicology, Vol. 1, No. 1, p 18-26, February 1973. 4 fig, 3 tab, 5 ref.

Descriptors: *Bioassay, Absorption, Metabolism, Radioactivity techniques, Radiochemical analysis, Freshwater fish, Aquatic plants, Chemical analysis, Lboratory tests, Water sampling, Organic compounds, Fungicides, Path of pollutants, Tracers, Aquatic weeds, Snails, Aquatic life.
Identifiers: *Phenylmercuric acetate, *Elodea canadensis, *Lebistes reticulatus, *Helisoma campanulata, *Ceratophyllum demersum, *Biotransformation, Biological magnification, Bioaccumulation, Metabolites, Excretion, Fate of pollutants, Hg-203, Slimicides, Electron capture gas chromatography, Scintillation counting, Biological activity, Half-life, Ethylmercuric chloride, Sample preparation, Guppy, Mercury radiosiotopes.

Guppies (Lebistes reticulatus), snails (Helisoma campanulata), elodea (Elodea canadensis), and coontail (Ceratophyllum demersum) were exposed to 0.05-0.5 microM of Hg-203-labeled phenylmercuric acetate (PMA) in order to study the uptake and metabolism of the slimicide by aquatic organisms. Studies were carried out in all glass aquaria with aeration at 25-29 C. A gamma-scintillation spectrometer was used to periodically measure radioactivity in samples of water and organisms. After measuring the total Hg-203 content, samples were homogenized in water containing HCl, extracted with benzene, purified according to the Westoo (1968) method, and analyzed by electron capture gas chromatography. Inorganic Hg-203 content was determined by the Clarkson and Greenwood (1970) method. Some guppies and elodea were placed in fresh water after the uptake period to determine PMA loss rate. The organisms tested were found to readily take up PMA. The PMA uptake was related to the time of exposure and the PMA concentration, the absorbed PMA being mainly converted to inorganic mercury. Ethylmercuric chloride was a minor metabolic product. Mercury-203 was not quickly eliminated from the guppy, elodea, and coontail when they were placed in fresh water, the biological half-life of Hg-203 residues ranging between 43 to 58 days. KINETIC STUDY OF PHOSPHATE REACTION WITH ALUMINUM OXIDE AND KALONITE,
Harvard Univ., Cambridge, Mass. Div. of Engineering and Applied Physics.
Y. S. R. Chen, J. N. Butler, and W. Stumm.
Environmental Science and Technology, Vol. 7, No. 4, p 327-332, April 1973. 8 fig, 3 tab, 35 ref.

Descriptors: *Phosphates, *Sediments, *Cydling nutrients, *Kaolinite, Water temperature, Hydrogen ion concentration, Chemical reactions, Kinetics, Clays, Clay minerals, Adsorption, Fluorides, X-ray diffraction, Electron microscopy, Laboratory equipment.
Identifiers: Alumina, Rate constants, Activation energy, Sample preparation.

To better define the role of sediments in cycling nutrients in water systems, the quantitative reaction kinetics of phosphate with clay minerals (alumina and kaolinite) were studied at 25 C and 50 C. Reactions were carried out in cylindrical water-jacketed reaction vessels covered lucite plates to prevent loss of water vapor. Temperature and pH were carefully controlled. Precipitates were examined by electron microscopy and materials were identified by X-ray diffraction. The reaction of aqueous phosphate (approx 0.0003 M) with alumina and kaolinite shows a rapid (12-24 hr) adsorption step followed by a slow process, obeying a first-order rate law, which extends over the next 60 days and probably involves nucleation and growth of a hexagonal A1P04 phase. For kaolinite with 10.7 sq m/g surface area, solids concentration 7.5 g/l, pH equals 4.6, as well as for alpha-A1203 with surface area 10 sq m/g, solids concentration 2.5 g/l, and pH equals 4.3, the first-order rate constant at 50 C is 0.222/day. Increasing temperature increases the rate with an activation energy of 2.4 Kcal/mol. Addition of fluoride ion decreases the amount of phosphate initially adsorbed but does not effect the first-order rate. The rate constant increases proportionally to the solid surface available, and decreases with increasing pH to essentially zero at pH more than or equal to 7. Successive addition of phosphate aliquots to the same sample of solid uses up the sites available for the rapid initial step but does not strongly influence the rate of the slow step. CHEMICAL EQUILIBRIUM MODELS OF LAKE KEYSTONE, OKLA.,
Oklahoma State Univ., Stillwater. Dept. of Chemistry.
C. P. Falls, and L. P. Varga.
Environmental Science and Technology, Vol. 7, No. 4, p 319-327, April 1973. 6 fig, 2 tab, 32 ref.

Descriptors: *Mathematical models, *Water quality, Sediments, Thermodynamic behavior, Depth, Distribution patterns, Water temperature, Dissolved oxygen, Carbon dioxide, Suspended solids, Dissolved solids, Hydrogen ion concentration, Calcium, Magnesium, Strontium, Sodium, Potassium, Bicarbonates, Carbonates, Sulfates, Fluorides, Silica, Sulfides, Chlorides, Montmorillonite, Clays, Illite, Calcite, Quartz, Kaolinite, *Oklahoma.
Identifiers: *Keystone Lake (Okla), *Chemical equilibrium.

A series of equilibrium models were formulated and compared with chemical and physical observations made from May, 1966 to June, 1968. Water properties determined were temperature, dissolved oxygen, dissolved CO2, suspended solids, dissolved solids, pH, and concentrations of Ca, Mg, Sr, Na, K, bicarbonate, carbonate, sulfate, fluoride, silica, sulfide, and chloride. X-ray diffraction of sediments and suspended solids showed the presence of montmorillonite, kaolinite, illite, quartz, and calcite. The models were based on the thermodynamic equilibrium condition of evaporite minerals (halite, gypsum, dolomite, calcite, and SrSO4), clays (kaolinite, sodium montmorillonite, and calcium montmorillonite), and the liquid and gas phases which comprise the Lake Keystone drainage basin. Ten components were calculated by Gibbs phase rule, using analytical data for the total chemical compositions and the available thermochemical data. The model which simulated the experimental data most closely was based on the hypothesis that waters, originally in equilibrium with the common evaporite minerals of the Permian formation within the Arkansas River drainage basin, were diluted by fresher waters not exposed to these minerals as they flowed toward the reservoir. The waters then approached a state of chemical equilibrium with clay minerals which adjusted their final composition. (Little-Battelle)

SEASONAL FLUCTUATIONS OF IONIC COPPER IN KNIGHTS POND, MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Zoology.
K. D. Kimball.
Limnology and Oceanography, Vol 18, No 1, p 169-172, January 1973. 2 fig, 13 ref.

Descriptors: *Copper, *Path of pollutants, *Seasonal, Water pollution sources, *Water analysis, *Decomposing organic matter, Dissolved oxygen, Hydrogen ion concentration, Water temperature, Hardness (Water), Leaves, Chemical analysis, Spectrophotometry, Ponds, Fluctuations, *Massachusetts.
Identifiers: Sample preparation, Knights Pond (Mass), Bioaccumulation, Transport, Mobilization.

Ionic copper levels in Knights Pond (Mass.) were measured 34 times from April 19, 1971 to March 20, 1972, in order to investigate the copper cycle in this inland pond. DO, pH, temperature, total residue, and Ca-Mg haraness were also measured. Precipitation was measured daily. Copper in samples was complexed with sodium diethyldithiocarbamate, the complex extracted with xylene, and the absorbance of the xylene-chelate determined with a spectrophotometer. Copper concentrations in the pond ranged from below detectability to 105 micrograms/liter over the 11 months. Values were low from summer through late fall, at which time they ascended to their highest level during midwinter and then slowly decreased throughout late winter and spring toward the summer low values again. No significant correlations were found between copper and pH, total residue, or hardness. Moderate linear correlations were found between dissolved oxygen and copper at the surface stations. Copper is apparently concentrated in the vegetation during the growing season and released from the leaf litter by decomposition in the fall. The chemical characteristics of the watershed are unable to completely complex or precipitate this additional copper, resulting in increased concentrations in the pond during fall and winter. ADSORPTION OF CHLORINATED HYDROCARBONS FROM SEAWATER BY A CROSSLINKED POLYMER,
Woods Hole Oceanographic Institution, Mass.
G. R. Harvey.
Available from the National Technical Information Service as PB-213 954, $3.00 in paper copy, $0.95 in microfiche. Report No. WHOI-72-86, November 1972. 31 p, 2 fig, 2 tab, 16 ref, 1 append. Contract No. EPA-CQ-16020.

Descriptors: *Polychlorinated biphenyls, *Adsorption, *Separation techniques, *Sea water, Water analysis, DDT, DDE, Dieldrin, Filtration, Gas chromatography, Sampling, Atlantic Ocean.
Identifiers: *Amberlite XAD-2, *Sargasso Sea, Aroclor 1254, Recovery, Detection limits, On board analysis, Electron capture gas chromatography.

A synthetic resin, Amberlite XAD2, was evaluated as an adsorption medium for chlorinated hydrocarbons (DDT, DDE, dieldrin, and PCB) in seawater with the objective of developing an analytical method for recovering low concentrations of these compounds. Testing of the resin was conducted with seawater containing dissolved organic carbon (DOC), and DDT, DDE, dieldrin, and PCB. The results with the DOC samples showed that coastal seawater contained about 20 percent hydrophobic organic matter and that at flow rates of 0.7 and 1.4 bed vol./min the resin preferentially adsorbed hydrophobic matter. Recovery of DDE, dieldrin, and DDT from seawater was 125, 108, and 92 percent respectively. The resin showed very good adsorption capacity. Chlorinated hydrocarbons were eluted with acetonitrile and ethanol. Analysis of Woods Hole seawater gave PCB ranges of 7.1 to 35 ppt and DDT ranges of less than 0.1 to 3.3 ppt. Concentrations of PCB's were also determined in water of the North Atlantic Ocean from the surface and various depths. The concentrations averaged 20 ppt. The surface water of the Sargasso Sea contains lower concentrations of PCB than the North Atlantic. The method developed is deemed suitable for seawater analysis and probably for freshwater. It is suggested that the resin could be used for in situ sampling while a ship is underway. (Little-Battelle)

STRUCTURE ACTIVITY CORRELATIONS OF BIODEGRADABILITY OF DDT ANALOGS,
Illinois Univ., Urbana. Dept. of Entomology.
I. P. Kapoor, R. L. Metcalf, A. S. Hirwe, J. R. Coats, and M. S. Khalsa.
Journal of Agricultural and Food Chemistry, Vol 21, No 2, p 310-315, March/April 1973. 4 fig, 5 tab, 15 ref.

Descriptors: *Fish, *Snails, *Biodegradation, *Algae, Absorption, Metabolism, Radioactivity techniques, Invertebrates, Chromatography.
Identifiers: Methoxy-methiochlor, Methyl-ethoxychlor, Chloro-methylchlor, *Biomagnification, Metabolic pathways, Biodegradability index, Macroinvertebrates, Scintillation counting, Oedogonium, Gambusia, Physa, Thin layer chromatography, Partition coefficients, Mosquitofish.

Methoxy-methiochlor (2- (p-methoxyphenyl)-2-(p-methylthiophenyl) - 1,1,1-trichloroethane), methyl-ethoxychlor (2± (p-methylphenyl) - 2- (p-ethoxyphenyl) - 1,1,1-trichloroethane), and chloro-methylchlor (2- (p-chlorophenyl) -2- (p-methylphenyl) - 1,1,1-trichloroethane) were studied for metabolic pathways in mice and insects (salt marsh caterpillar) and for biodegradability in a model ecosystem which included algae, fish, snails, and mosquitoes. The compounds were radiolabeled and radioassayed by scintillation counting. The metabolic products were identified by chromatography. The distribution of metabolites is shown for each organism. All three compounds are highly degradable with methoxy-methiochlor the most fugitive. With Gambusia biomagnifications of undegraded products were 300-fold for methoxy-methiochlor, 333-fold for methyl-ethoxychlor, and 1400-fold for chloro-methylchlor. With snails, the biomagnifications were 3400-fold for methoxy-methiochlor, 42,000-fold for methyl-ethoxychlor, and 21,000-fold for chloro-methylchlor. The percentages of undegraded compound to total ranged from 1 to 25 percent. The pathways of metabolism are illustrated. Methoxy-methiochlor and methyl-ethoxychlor were good substrates for multifunction oxidases and showed biodegradability indices of 2.75 and 1.20, respectively. Chloro-methylchlor was also a satisfactory substrate and showed a biodegradability index of 3.43, compared to 0.015 for DDT. (Little-Battelle)

HYDROLYSIS OF AQUEOUS SOLUTIONS OF SODIUM 2,2-DICHLOROPROPIONATE UNDER SELF-INDUCED ALKALINE CONDITIONS,
Agricultural Research Service, Fargo, N. Dak. Metabolism Lab.
F. S. Tanaka, and R. G. Wien.
Journal of Agricultural and Food Chemistry, Vol 21, No 2, p 285-288, March/April 1973. 2 fig, 1 tab, 12 ref.

Descriptors: *Dalapon, *Chlorinated hydrocarbon pesticides, *Hydrolysis, *Aqueous solutions, Chemical reactions, *Chemical degradation, *Pollutant identification, Herbicides, Hydrogen ion concentration, Organic acids, Mass spectrometry, Nuclear magnetic resonance.
Identifiers: Sodium 2 2-dichloropropionate, *Flame ionization gas chromatography, *Metabolites, 2 2-Dichloropropionic acid, Gas liquid chromatography, Pyruvic acid, Hydrochloric acid, Infrared spectroscopy, Sodium dalapon, Vacuum distillation.

Aqueous solutions of sodium 2, 2-dichloropropionate were previously reported as having an approximate pH of 5 to 6. The data obtained in this study show that freshly prepared solutions of greater than about 0.9 m concentration exhibit a basic pH. Upon standing, however, these salt solutions become acidic due to the hydrolysis of the 2,2-dichloropropionate to yield pyruvate and hydrochloric acid. The approximate pH of the sodium 2,2-dichloropropionate solutions is estimated at different concentrations, and the rates of pH change due to hydrolysis are reported for a dilute, intermediate, and high concentration of material under mildly alkaline conditions. PRODUCTION OF THE GIANT KELP, MACROCYSTIS, ESTIMATED BY IN SITU INCORPORATION OF C-14 IN POLYENTHYLENE BAGS,
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
D. W. Towle, and J. S. Pearse.
Limnology and Oceanology, Vol 18, No 1, p 155-159, January 1973. 3 tab, 19 ref.

Descriptors: *Kelps, *Photosynthesis, *On-site investigations, Estimating, *Plant tissues, Marine algae, Marine plants, Phaeophyta, Primary productivity, Laboratory tests, Radioactivity techniques, Carbon radioisotopes, Methodology, Standing crops.
Identifiers: *Macrocystis pyrifera, *Photosynthetic rates, C-14, Scintillation counting, Sample preparation.

Incorporation of C-14 by the giant kelp Macrocystis pyrifera was measured in situ by enclosing individual blades within polyethylene bags in a kelp bed. Incubation were carried out in full sunlight for 3 hr. The contents of the bag were removed to an opaque container, transported to a dimly lit laboratory, and rinsed in unlabeled seawater. Duplicate samples from 3 sections of each kelp blade were solubilized, mixed with H2O2 and added to scintillation fluid for counting. Incorporation was highest in the tips of the blades in the canopy, about 0.315 mg C/g/hr on the basis of wet weight. In the densest part of the kelp bed, total wet standing crop of Macrocystis was about 5.9 kg/sq m, and production of Macrocystis blades in that area was estimated to be at least 6.8 g C/sq m/day, or about 17 g organic matter/sq m/day. STUDIES IN THE COMPLEX FORMATION OF METAL IONS WITH SUGARS. PART I. THE COMPLEX FORMATION OF COBALT (II), COBALT (III), COPPER (II) AND NICKEL (II) WITH MANNITOL,
Oslo Univ. (Norway). Dept. of Chemistry.
J. Dolezal, K. S. Klausen, and F. J. Langmyhr.
Analytica Chimica Acta, Vol 63, No 1, p 71-77, January 1973. 1 fig, 5 ref.

Descriptors: *Heavy metals, *Cations, *Spectrophotometry, *Alkali-aggregate reactions, Chemical reactions, Chelation, Organic compounds, Chemical analysis, Cobalt, Copper, Nickel, Carbohydrates, Manganese.
Identifiers: *Mannitol, *Complexation, Ligands, Absorbance.

The complex formation of mannitol with cobalt (II), cobalt (III), copper (II) and nickel (II) in alkaline media (0.1 to 4 M potassium hydroxide) was studied by spectrophotometry. Cobalt (II) and cobalt (III) reacted with mannitol to form 1:1 complexes; the conditional constant (in 4 M potassium hydroxide) of the former complex was found to be 220,000. The reaction of copper (II) with the sugar gave two complexes. In the range 0.5-4 M potassium hydroxide and with the ligand in large excess, a CuM compound was formed; in mixtures with a small excess or with the reactants present in equimolar amounts, the species Cu2M predominated. In 0.5 M potassium hydroxide, the conditional constant of the latter compound was found to be 63 million. The low stability of the nickel (II) complex (es) with mannitol made it impossible to draw any definite conclusions as to the composition of the species formed in alkaline medium. (Holoman-Battelle)

OXYGEN-CARBON DIOXIDE-NUTRIENTS RELATIONSHIPS IN THE NORTHEASTERN PACIFIC OCEAN AND SOUTHEASTERN BERING SEA,
Oregon State Univ., Corvallis.
S. Alvarez-Borrego.

UNIV. OF ILL. URBANA-CHAMPAIGN

Available from University Microfilms, 300 No. Zeeb Rd. , Ann Arbor Mich., 48106, Order No. 73-7816. Ph D Dissertation, 1973. 186 p.

Descriptors: *Dissolved oxygen, *Carbon dioxide, *Nutrients, *Pacific Ocean, *Model studies, Spatial distribution, Water temperature, Hydrogen ion concentration, Alkalinity, Calcite, Phosphates, Nitrates, Depth, Regression analysis, Mathematical models, Indian Ocean, Chemical precipitation, Calcium carbonate, Salinity, Density.
Identifiers: *Bering Sea, Vertical distribution, Regression coefficients, Multiple linear regression analysis, Seasonal variation, Aragonite, Data interpretation, Dissolution, Oxygen consumption.

The vertical distribution of density, salinity, temperature, dissolved oxygen, apparent oxygen utilization, nutrients, preformed phosphate, pH, alkalinity, alkalinity:chlorinity ratio, 'in situ' partial pressure of carbon dioxide, and percent saturation of calcite and aragonite, for the Southeastern Bering Sea, is studied and explained in terms of biological and physical processes. Some hydrological interactions between the Bering Sea and the North Pacific Ocean are explained. In the Northeastern Pacific Ocean the oxygen-phosphate and oxygen-nitrate relationships for the region of the water column above the oxygen minimum zone vary systematically with latitude. In the entire water column, these slopes vary with depth. An effect on the slopes of the oxyten-phosphate and oxygen-nitrate relationships, similar to that observed when decreasing latitude, is observed when comparing winter versus summer data. The winter slopes are higher than the summer slopes. Multiple regression analysis was applied to the oxygen, phosphate, nitrate, and potential temperature data from stations at different geographic locations in the Pacific and Atlantic Oceans. Confidence intervals for the regression coefficients are consistent with the values predicted by the Redfield model for the delta 02:delta PO4 and delta 02:delta NO3 ratios for biological processes. After the field oxygen, phosphate and nitrate data were found consistent with Redfield's model, preformed phosphates were calculated by using the model, and potential temperature versus preformed phosphates diagrams were constructed for different stations in the Pacific and Indian Oceans to study their water masses. In the Northeastern Pacific Ocean the total inorganic carbon dioxide-oxygen relationship varies with depth. Multiple linear regression analysis was applied to express total inorganic carbon dioxide, normalized to constant salinity, as a function of potential temperature and total alkalinity and oxygen normalized to constant salinity. Results of the regression are in agreement with the assumption that total alkalinity changes in the open ocean are only due to salinity changes in calcium carbonate dissolution or precipitation, and with Redfield's model for the prediction of the total inorganic carbon dioxide-oxygen ratio for the biochemical oxidation. PROCESSES AFFECTING THE OCEANIC DISTRIBUTION OF CARBON DIOXIDE,
Oregon State Univ., Corvallis.
C. H. Culberson.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106, Order No. 73-3957. Ph D Dissertation, 1972. 188 p.

Descriptors: *Carbon dioxide, *Oceans, *Model studies, *Spatial distribution, *On-site data collections, *Water chemistry, Sea water, Pacific Ocean, Indian Ocean, Atlantic Ocean, Water properties, Path of pollutants, Salinity, Hydrogen ion concentration, Alkalinity, Silicates, Phosphates, Nitrates, Nitrites, Oregon, Organic matter, Oxidation, Dissolved oxygen, Degradation (Decomposition), Calcium carbonate.
Identifiers: *Stoichiometric models.

The stoichiometric model of organic decomposition in seawater (Redfield, Ketchum, and Richards, 1963) was used to describe the oceanic distribution of total carbon dioxide. It was assumed that the concentration of total carbon dioxide was the sum of three terms: (1) the initial concentration of carbon dioxide, (2) the increase in carbon dioxide due to the oxidation of organic matter, and (3) the increase in carbon dioxide due to the solution of calcium carbonate. The vertical and horizontal distribution of total carbon dioxide in the Pacific, Indian, and South Atlantic Oceans was shown to conform to this model. The model for the distribution of total carbon dioxide was applied to the vertical distribution of carbon-13 at the North Pacific (1969) GEOSECS intercalibration station (Kroopnick, Deuser, and Craig, 1970). Values of Delta C-13 calculated from the stoichiometric model agreed to within plus or minus 3 percent with the measured values at this station. Near-bottom chemical measurements were made on three cruises: YALOC-69 to the Eastern Tropical Pacific, Y6908F off the Oregon Coast, and TT-46 to the Caribbean Sea and North Atlantic. Salinity, oxygen, pH, alkalinity, silicate, phosphate, nitrate, and nitrite were measured at heights from 0.5 to 300 m above the bottom. No measurable salinity, oxygen, silicate, phosphate, nitrate, or nitrite gradients were observed. A statistically significant near-bottom increase in pH and alkalinity was found. However, the increase was small and could have resulted from undetected analytical and/or sampling errors. (Holoman-Battelle)

THE UPTAKE, STORAGE, AND RELEASE OF DIELDRIN AND SOME EFFECTS OF ITS RELEASE IN THE FISH, CICHLASOMA BIMACULATUM (LINNAEUS),
Michigan Univ., Ann Arbor.
D. L. Brockway.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106, Order No. 73-6797. Ph D Dissertation, 1972. 111 p.

Descriptors: *Absorption, *Dieldrin, *Bioassay, *Pesticide toxicity, Laboratory tests, Pesticide residues, Path of pollutants, Fish physiology, Freshwater fish, Chlorinated hydrocarbon pesticides, Insecticides, Water analysis, Chemical analysis, Cichlids, Water pollution effects.
Identifiers: *Bioaccumulation, *Cichlasoma bimaculatum, Mobilization, Excretion, Metabolites, Hormones, Fate of pollutants, Continuous flow technique, Electron capture gas chromatography, Gas liquid chromatography.

The uptake of the pesticide dieldrin from water, its storage in tissues of a tropical fish (Cichlasoma bimaculatum) and its release from storage has been investigated. Several parameters considered to be indicators of the effects on the fish of the release of dieldrin from tissue storage were also measured. Dieldrin in acetone solution was added to water in continuous-flow exposure vessels. The concentration of insecticide in water and fish tissue was measured by electron-capture, gas-liquid chromatography. Blood- and brain-dieldrin concentrations were higher in fish killed by dieldrin than in fish exposed to dieldrin, but not killed. Uptake-release experiments were performed in which fish were exposed to sublethal concentrations (1 or 2 ppb) for up to 34 days. After this exposure, tissue residue levels had nearly reached a plateau. When exposure was terminated, the whole-body residue concentration factors on a wet-weight basis were between 6,000 and 11,000. Whole-body concentrations were higher than brain, and blood concentrations were lowest. After the exposure period, the fish were held in water without dieldrin up to 59 days and subjected to fasting and/or a 5 C temperature rise. During the release period, fasting alone caused only a slow rate of loss of the whole-body dieldrin residues. Fasting plus a 5 C temperature rise produced a more rapid loss of whole-body dieldrin residues. Fish which were fed normally and subjected to the 5 C increase in temperature showed a very rapid loss of dieldrin and little loss of fat. Two types of measurements were made to study the probability of post-exposure sublethal effects: (1) blood- and brain-dieldrin concentrations were measured in juvenile fish, and (2) excretion of 17-OHCS hormone metabolites in urine was measured in catheterized adult fish. During the post-exposure period there was not a significant increase in blood- or brain-dieldrin concentration above the final concentration of the exposure phase. The quantity of hormone metabolite excreted in urine was always higher in fish exposed to dieldrin than in controls after the first day of urine collection. The level of hormone excretion, however, decreased continuously in exposed fish after the first. day. Under the test conditions, there was no evidence that dieldrin was released in toxic quantities when a fish was forced to utilize its fat stores. (Holoman-Battelle)

Identifiers: *Pseudomonas aeruginosa, *Salmonella spp, Fecal coliforms, Selective media, Serotypes, Survival, Culture media, Agars, Biochemical tests, Salmonella paratyphi A, Salmonella cubana, Salmonella tennessee, Arizona,Ultra-filter MPN method, Most probable number test, Enumeration.

A practical, sensitive, quantitative method for the isolation and enumeration of Salmonellae and pyocyanogenic Ps. aeruginosa from wastewaters, treatment effluents, streams, stormwater runoff, and sludges, in all seasons of the year, is described. The use of glass fiber ultra filters allows

the testing of low turbidity to crystal-clear waters in a range from 1-liter to 10-gallon samples. The methods described are useful for testing treatment plant effluents, streams, well waters, and non-chlorinated drinking waters. An appendix and six tables describe in detail media employed, schemata for five multiple tube methods, quantitative results obtained compared with published qualitative results, and proof for claims made for critical temperature, and the use of glass fiber ultra filters. The persistence of Salmonella species, Pseudomonas aeruginosa, and fecal coliforms in soils treated with various types of municipal sludges is reported. From results obtained testing relatively small soil samples at weekly intervals, it is evident that sludge-borne pathogens may persist on agricultural or grass lands in the top two inches (5 cm) of soil for at least 21 weeks. It is suggested that a more complete and useful surveillance of salmonellosis for large urban areas can be attained by analysis monthly of municipal primary and secondary waste treatment plant sludges. Results obtained can indicate current high carrier rates of certain Salmonella serotypes or suggest the presence of pathogens in local food or feed products that may need inspection to avert spread. THE STATE OF MARINE POLLUTION IN THE MEDITERRANEAN AND LEGISLATIVE CONTROLS.
Food and Agriculture Organization of the United Nations, Rome (Italy). General Fisheries Council for the Mediterranean.

Studies and Reviews No 51, 72 p, September 1972. 76 ref.

Descriptors: *Coasts, *Harbors, Water pollution sources, *Sewage, *Domestic wastes, Oil, Pesticides, Radioactive wastes, *Thermal pollution, Floatsam, Suspended load, Bottom sediments, Polychlorinated biphenyls, *Industrial wastes, *Oil pollution.
Identifiers: *Mediterranean Sea.

A questionnaire was sent to all countries bordering the Mediterranean. The questionnaire covered the following subjects: pollution by domestic sewage, industrial pollution, oil pollution, other forms of pollution (such as pesticides, radioactive substances, thermal pollution, floating materials, suspended matter, bottom deposits, and PCBs), and legislation on water pollution. The state of pollution in inshore waters of the Mediterranean has reached a critical level. High quantities of domestic sewage are discharged untreated or insufficiently treated, and industrial effluents carry high organic loads. Almost total absence of control over industrial toxic and solid wastes prevails. The state of pollution in the open sea is almost as severe due to waste dumping, pipeline discharges, and high amounts of pesticides carried out by wind. Oil pollution of the beaches and inshore waters and even of the open sea is common. Discharge of oil residues is still allowed in some areas, and only 5 of 14 harbors have facilities for receiving such residues from tankers. Damage to fishing gear and the palatability of fish is extensive. In most Mediterranean countries insufficient attention is paid to pollution control and to the enforcement of legal regulations. POLLUTION IN SOME BRITISH ESTUARIES AND COASTAL WATERS.
Royal Commission on Environmental Pollution, London (England).

Third Report, September 1972. 128 p, 11 fig, 26 tab, 59 ref. 3 append.

Descriptors: *Estuaries, *Pollutants, Rivers, Runoff, *Discharge (Water), *Waste disposal, Tides, Scour, Water pollution control, Management, Regulations, Biota, Benthos, Fisheries, Fish, Governments, Monitoring, Research, Economics, Legislation.
Identifiers: *Great Britain, Wales, Scotland, England.

A great and increasing volume of pollutants reaches British estuaries from rivers and direct discharge, tidal scour cannot indefinitely continue to break down or disperse all such wastes. Estuaries have received too little protection from the British Government, and integration of estuarine pollution control policies with a national policy for waste disposal is suggested. The law should require maximum practical abatement before discharge of all pollutants which are unlikely to be rendered harmless by natural processes. The government should also adopt 2 biological criteria for management of estuarine waters: ability to support mud bottom fauna essential for sustaining sea fisheries and ability to allow passage of migratory fish at all tide states. Monitoring, research, economics, administration, and legislation for Wales, Scotland, and England are considered. (Ensign-PAI)

HEAVY METALS IN ESTUARIES AND THE COASTAL ZONE,
Oregon State Univ., Corvallis. School of Oceanography.
N. H. Cutshall.
In: Heavy Metals in the Environment, Seminar, Oregon State University, Water Resources Research Institute, October 5, 1972, Corvallis. p 37-44, January 1973. 1 fig, 1 tab, 13 ref.

Descriptors: *Coasts, *Estuaries, *Water pollution effects, *Heavy metals, Trapping, Aquatic life, Biota, Ecosystems, Fisheries.

Whether released to air or water or soil, heavy metal contamination is eventually carried into estuarine and coastal water systems. Estuaries serve as funnels, through which land runoff is transported into the coastal ocean. In some cases estuaries appear to effectively trap or delay a good deal of the heavy metal flux passing through them. Estuaries are also avenues by which anadromous fishes travel from spawning beds to the sea and return. Estuaries are spawning and nursery grounds for a wide variety of coastal organisms. Consequently, adverse changes in estuaries may be reflected in the biota of a broad geographic area beyond the estuary itself. Examples are given that show the complexity of heavy metal cycling in coastal ecosystems and also demonstrate that the role of natural partitioning in the effects of heavy metal contamination is substantial. W73-10557

NITRATE REDUCTION IN THE VICINITY OF TILE DRAINS,
Illinois Univ., Urbana. Dept. of Agricultural Engineering.
L. A. Davenport, W. D. Lembke, and B. A. Jones.
Available from the National Technical Information Service as PB-221 020, $3.00 in paper copy, $0.95 in microfiche. Illinois Water Resources Center, Urbana Research Report No 64, March 1973. 107 p, 30 fig, 10 tab, 25 ref. 2 append. A-044-ILL (1). 14-31-0001-3513.

Descriptors: *Denitrification, *Drainage, *Nitrates, Porous media, Temperature, Water pollution control, *Tile drains, Path of pollutants.
Identifiers: *Substrate materials, *Temperature effects, *Methanol.

The fate of nitrates as they travel through a long porous column at a slow rate was observed in this study with temperature and substrate materials variable. During a one month period of flow with pore velocities averaging up to 21 centimeters per day, losses as high as 89 percent were found for a methanol treatment at 24 degree C while for 13 degree C losses were reduced to 46 percent. A sawdust substrate material resulted in very little reduction of nitrate concentrations at 24 degree C and actual increases (presumably from mineralization) at 13 degree C. Since methanol was found to be an effective means of removing nitrate from a slowly moving stream of water at temperatures as low as 13 degree C, it will be used as a standard in future field studies to evaluate less expensive substrate materials.

UNIV. OF ILL. URBANA-CHAMPAIGN

A PROTOTYPE TOTALISING CURRENT-METER (MARK II); A SELF-MOORED VERSION FOR NEAR-SURFACE USE ESPECIALLY IN FOUL WATER ESTUARIES IN CONNECTION WITH POLLUTANT DISPERSAL STUDIES,
National Inst. of Oceanography, Wormley (England).
J. N. Carruthers.
Bulletin, Institut Oceanographique, Monaco. Vol 70, No 1418, 15 p. 1972. 2 fig, 7 ref.

Descriptors: *Pollutants, *Dispersion, *Currents (Water), *Current meters, Design data, Estuaries.
Identifiers: Totalizing self-moored current-meter, Mark II.

A new self-moored totalizing current meter was made expressly for recording the totality of upper water movements in eight directions over a period of a week or more for application to questions of pollutant dispersal. The instrument is entirely mechanical and works on the Ekman ball-dropping principle. The various features of the instrument are described. Observations made with the instrument have lasted for about 14 days, but the time could be doubled or tripled by using a bigger hopper. Important features of the instrument include the facts that no dirt can get into the working parts which are enclosed in a fabric bag and the instrument can not foul its own moorings as it rides over them at slack water or change of tidal direction. RANUNCULUS FLUITANS LAMARCK IN LYON,
C. Forestier.
Bull Mens Soc Linn Lyon. Vol 41, No 6, p 120-124. 1972. Illus.
Identifiers: *France (Lyon), Putrefaction, *Ranunculus-Fluitans, *Rhone River.

The presence of R. fluitans in the Rhone River at Lyon (France), where it has been spreading remarkably for 2 or 3 yrs. is reported for the first time. The cause of this invasion was attributed to the action of the Pierre-Benite hydroelectric dam which reduced the water flow rate and limited the low water phenomena that used to occur frequently in times of little rainfall. The colonization of this plant does not present any threat to navigation in this case, although it may cause an accumulation of debris and various objects to areas where colonization is heavy. However, destruction of these plants would be unwise since they play an important role in the degradation of putrid matter released into the slowed-down currents.--Copyright 1973, Biological Abstracts, Inc.

ACCUMULATION OF FALLOUT CESIUM 137 IN SOILS AND SEDIMENTS IN SELECTED WATERSHEDS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
J. R. McHenry, J. C. Ritchie, and A. C. Gill.
Water Resources Research, Vol 9, No 3, p 676-686, June 1973. 3 fig, 9 tab, 17 ref. AEC-AT (49-7)-3029).
Descriptors: *Tracers, *Sedimentation, *Fallout, *Cesium, Reservoirs, Bottom sediments, Sampling, Erosion, Soil erosion, Sediment yield, Radioactivity techniques, Adsorption, Path of pollutants, Radioisotopes.
Identifiers: Gamma ray spectrography.

The fallout of radioisotopes produced in nuclear explosions provides tracers for following the movement of soil particles in the sedimentation cycle. Cesium 137, which is strongly adsorbed by most soil particles, was identified in sampled soils and sediments. The concentration of Cs-137 ranged from 0.01 to 3.28 pci/g in soils and from 0.01 to 10.05 pci/g in sediments. Uranium, thorium, and potassium were determined simultaneously with Cs-137. Total potassium ranged from a tracr to 5.4%, uranium from 0.5 to 9.4 ppm, and thorium from 1.9 to 42.0 ppm. The concentration of Cs-137 in reservoir sediments varied with depth. In some reservoirs the years of greatest Cs-137 fallout were correlated with layers containing peak concentrations of Cs-137 in the sediment profile. The occurrence of Cs-137 in sediments was significantly correlated with the amount of clay and of organic matter present. The amount of Cs-137 was greater per unit area in sampled sediments than in the contributing watersheds, and the relative concentration factor was as large as 24. This accumulation of Cs-137 in reservoir sediments is indicative of the pollution possible in reservoirs as a result of fallout within the watershed but not necessarily within the reservoir. LEAD OUTPUTS IN STREAMFLOW FROM A WATERSHED ECOSYSTEM,
Illinois Univ., Urbana, Dept. of Forestry.
G. Rolfe, and J. Edgington.
Water Resources Bulletin, Vol 9, No 2, p 372-375, April 1973. 1 fig, 1 tab.

Descriptors: *Lead, *Path of pollutants, Urban hydrology, *Illinois, Water pollution sources, Environmental effects, Data collections, Hydrologic data, Water quality.
Identifiers: *Champaign-Urbana (Ill).

The movements and effects of lead are studied in an 86 sq mi watershed ecosystem at Champaign-Urbana, Illinois. The objectives are to understand and mathematically model the movements and effects of lead in an ecosystem. The system is drained by the Saline Branch Drainage Ditch, a rural stream draining the agricultural area to the north of the cities and Boneyard Creek, an urban stream draining Champaign and Urbana. The two streams join on the northeast edge of Urbana and leave the watershed on its southeastern edge. Lead emitted through the combustion of gasoline containing tetraethyl lead is considered the predominant source (95%) of lead input to the ecosystem. Preliminary estimates, based on traffic volumes and gasoline consumption, indicates approximately 2,340 kg of lead input to the ecosystem every 30 days. Approximately 70% of these emissions occur in the Urbana-Champaign area. The primary avenue of exit for lead from the watershed is through streamflow, including lead associated with suspended sediments. Only about 2%-3% of the lead input is exiting through the water system. This indicates a large buildup of lead in ecosystems of this type. Possible accumulation points in the ecosystem include stream-bottom sediments, soils, and biota. (Knapp-USGS)

PRECISE WATER VELOCITY MEASUREMENTS USING PHOTOGRAMMETRIC TECHNIQUES,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
P. R. Wolf, and T. J. Keating.
Water Resources Bulletin, Vol 9, No 2, p 312-319, April 1973. 3 fig, 6 ref.

Descriptors: *Mixing, *Currents (Water), *Thermal pollution, *Photogrammetry, *Aerial photoraphy, Velocity, Streamflow, Heated water, Remote sensing, *Lake Michigan.

Horizontal surface and subsurface water velocities in thermal plumes were studied using time lapse aerial photography and analytical photogrammetric techniques. Drogues were placed in an effluent plume. Photographic coordinates of drogue images were measured using a glass scale. From the photo coordinates and the results of a groud control survey, positions of drogues in the water were analyzed at known intervals of time. Drogue positions were mapped for selected exposures thereby providing a visual display of velocity vectors in the study area. A rigorous error analysis was performed to determine the validity of the computed results. (Knapp-USGS)

OIL ON PUGET SOUND, AN INTERDISCIPLINARY STUDY IN SYSTEMS ENGINEERING,
Washington Univ., Seattle. Coll. of Engineering.
J. Vagners, and P. Mar.
Available from NTIS, Springfield, Va., 22151 as COM-72-11251. Price $9.00 printed copy, $0.95 microfiche. Washington University Press, Seattle, 1972. 648 p, 114 fig, 58 tab, 91 ref, 14 append.

Descriptors: *Oil spills, *Water pollution sources, *Sounds, *Washington, *Water pollution control, Water quality, Ecosystems, Aquatic life, Oil industry, Oil pollution, Oily water, Pollution abatement, Path of pollutants, Winds, Currents (Water), Reviews, Publications, Bibliographies, Industrial wastes.
Identifiers: *Puget Sound (Wash).

A six-month interdisciplinary course was formulated to study the prevention and control (containment and cleanup) of oil spills in Puget Sound. The report evaluates the current status of oil spill prevention and control in Puget Sound and suggests recommendations to alleviate any noticeable deficiencies. Section one presents information on the oil spill statistics and notes on prevention and control. The second section presents a description of Puget Sound and its industries. The third section deals with the prevention and control of oil spills. A bibliography and a list of sources of unpublished information are included. Fourteen appendices contain supportive information and data. (Woodard-USGS)

WHAT IS THE ROLE OF FLOOD FLOWS IN THE POLLUTION OF THE CONNECTICUT RIVER AND ITS AMELIORATION,
Massachusetts Univ., Amherst.
C. J. Libbey, and W. Litsky.
In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area. Massachusetts Water Resources Research Center, Publication No. 25, 1973. Appendix E, 14 p, 5 fig, 2 tab. OWRR C-2169 (No. 3377) (1).

Descriptors: *Water quality, *Regression analysis, Coliforms, Suspended solids, Flood flow, Urban

runoff, Runoff, Biochemical oxygen demand, *Connecticut River, *Diversion, *Inter-basin transfers, Massachusetts.
Identifiers: Enfield Dam, Northfield (Mass.).

This appendix provides an analysis of available data on BOD, suspended solids, and coliform concentrations in relation to river flows for the Connecticut River. Storm or flood flows not only provide more water for the dilution of pollutants but also contribute large quantities of pollutants as they flush urban and rural lands and cause combined sewer overflows. Thus, the diversion of flood waters may have a significant effect on river water quality. Data from the Connecticut River at the Enfield Dam and at Northfield were studied using regression analysis and several graphs and tables are presented. The findings include: (1) Enfield which is below sewage treatment plants had high levels of BOD and coliform concentrations while Northfield which is in an agricultural area had high levels of suspended solids; (2) the BOD coliform levels varied inversely with the river flows; (3) the proposed diversion of flood waters will be an important factor in the quality of the river flow but the exact effects can not yet be estimated; and (4) a comprehensive river sampling program is needed. STUDY ON THE ACOUSTIC CHARACTERISTICS OF UNDER-WATER: FLOATING MUD-I, (IN JAPANESE),
Tokai Univ., Tokyo (Japan). Coll. of Marine Science and Technology.
K. Ogawa, A. Tsuchiya, and M. Nishimura.
J Coll Mar Sci Technol Tokai Univ. 6. p 1-17. 1972. Illus. English summary.
Identifiers: Acoustic studies, Coastal waters, *Japan, Method, *Mud (Floating), Pollution, Sea water, Ultrasonics, Water pollution sources.

Floating mud is a pollution factor in coastal sea water around Japan. Since composition and distribution of particles contained in the floating mud layer may vary depending on time, location and sea state, the usual marine observation method which requires much time and effort should not be effective to determine and analyze behavior of floating mud layer. To resolve such problems, an ultrasonic reflection method was developed to detect and to observe the floating mud layer. Tank and field experiments indicate that echoes of floating mud layer correspond closely to the underwater optical, thermal or chemical vertical distribution. The dependence between decrease of acoustic reflection loss on floating mud layer and increase of acoustic frequency as well as concentration of floating mud is observed. Similar relationship for acoustic reflection loss is calculated through Ament's theoretical formula giving the value of density and acoustic velocity of the sample collected in sea water. Concentration of floating mud layer can be evaluated by measuring acoustic reflection loss of this layer.--Copyright 1973, Biological Abstracts, Inc.

GROUNDWATER CONTAMINATION IN THE CORTARO AREA, PIMA COUNTY, ARIZONA,
Harshbarger and Associates, Tucson, Ariz.
K. D. Schmidt.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 95-111, (1972). 5 fig, 9 ref.

Descriptors: *Groundwater, *Water pollution, *Nitrates, *Irrigation wells, *Sewage disposal, Sewage treatment, Effluents, Groundwater recharge, Sewage lagoons, Sanitary engineering, Landfills, Septic tanks, Agricultural runoff, Geologic investigations, Flow nets, Analysis, Chlorides, Water wells, Seasonal, Hydrographs, Water management (Applied), Arizona, Arid lands.

High concentrations of nitrate have been found in water samples from irrigation wells north of the Tucson Arizona Sewage Treatment Plant. The plant, which had primary treatment prior to 1951, produced 2,800 acre-feet of effluent in 1940, 4,600 acre-feet in 1950, 16,300 acre-feet in 1960, and 33,000 acre-feet in 1970. Large amounts of treated effluent recharge the groundwater system north of the plant. Sources of nitrate contamination beside sewage effluent may be sewage lagoons, sanitary landfills, meat packing and dairy effluent, septic tanks, and agricultural runoff. Sewage effluent is considered to be the primary source of nitrate contamination in the area. Geologic and flow net analysis indicate that aquifer conditions minimize the effects of sewage effluent contamination. Chloride and nitrate migration appears to be similar in the aquifer. Large-capacity wells were sampled to reflect regional conditions, and chemical hydrographs of chloride and nitrate were analyzed. The seasonal nature of these hydrographs patterns depend on total nitrogen in sewage effluent. Management alternatives are suggested to decrease nitrate pollution by sewage effluent. OCCURRENCE OF SOME CHLORINATED ALIPHATIC HYDROCARBONS IN THE ENVIRONMENT,
The Univ. (England). Dept. of Oceanography.
A. J. Murray, and J. P. Riley.
Nature, Vol 242, No 5392, p 37-38, March 2, 1973. 2 tab, 5 ref.
Descriptors: Water analysis, *Sea water, *Pollutant identification, Organic compounds, Ecological distribution, Chemical analysis, Methodology, Atlantic Ocean, Air pollution, Water pollution.
Identifiers: *Electron capture gas chromatography, *Chlorinated hydrocarbons, *Aliphatic hydrocarbons, Sample preparation, Accuracy, Methyl chloride, Chloroform, Carbon tetrachloride, Trichloroethylene, Tetrachloroethylene.

Preliminary data are presented on the environmental (air and water) distribution of aliphatic chlorocompounds. The chlorinated hydrocarbons are stripped from 10- to 100-ml water samples by bubbling with nitrogen and are retained in a cooled silicone packed trap for analysis by electron capture gas chromatography. The coefficient of variation of the method was less than 15 percent. Analyses carried out on samples of surface waters from the North East Atlantic showed the presence of significant amounts of the same principal chlorinated hydrocarbons that were detected in the air samples. (Holoman-Battelle)

HEAVY METALS IN BRITISH WATERS,
Ministry of Agriculture, Fisheries and Food, Lowestoft (England). Fisheries Lab.
A. Preston.
Nature, Vol 242, No 5393, p 95-97, March 9, 1973. 1 fig, 4 tab, 15 ref.

Descriptors: *Heavy metals, *Sea water, *Path of pollutants, Research and Development, Distribution, Copper, Manganese, Nickel, Lead, Zinc, Copper, Cadmium, Commercial fish, Commercial shellfish, Atlantic Ocean, Marine fish, Metabolism, Kinetics, Ecological distribution.
Identifiers: *England, *Coastal waters, *Fate of pollutants, Seaham Harbor, Irish Sea, Severn Estuary, Fucus, Muscle, Marine environment.

The program of research and development on heavy metals in the marine environment, conducted by the Ministry of Agriculture, Fisheries and Food, has two chief objectives: (1) the establishment and continued monitoring of concentrations in fish and shellfish of commercial importance in Britain to provide a basis for estimates of human intake of heavy metals and (2) to provide data to assist an understanding of the behavior of heavy metals when they are introduced into the marine environment--the factors determining their geographical distribution, or biological fate, including their effect, if any, on marine resources and the kinetics of their metabolism in representative marine organisms. The results of seawater sampling on a pilot scale around the British Isles show that contamination is restricted to a few areas, chiefly, but not exclusively, linked to industrial development, and that even in these areas contamination does not spread very far offshore. Monitoring of commercial fish species shows that, except for sedentary shellfish, variations in inshore seawater metal concentrations are not reflected to any great extent in the edible portions of these species. Of course concentrations in inshore fish are sometimes higher than those in offshore fish, especially in the case of Cd, Hg, and Pb. This strongly indicates that metal pollution problems are essentially national or regional problems. (Holoman-Battelle)

THE DISTRIBUTION OF HEAVY METALS IN SEDIMENTS OF SORFJORD, WEST NORWAY,
Edinburgh Univ. (Scotland). Grant Inst. of Geology.

UNIV. OF ILL. URBANA-CHAMPAIGN

J. M. Skei, N. B. Price, S. E. Calvert, and H. Holtedahl.
Water, Air, and Soil Pollution, Vol 1, No 4, p 452-461, September 1972. 7 fig, 5 tab, 15 ref.

Descriptors: *Heavy metals, *Bottom sediments, *Soil analysis, *Pollutant identification, *X-ray fluorescence, Distribution, Sampling, Aquatic soils, Chemical analysis, Fjords, Cadmium, Copper, Lead, Zinc, Cores, Water pollution sources, X-ray analysis.
Identifiers: *Norway (Sorfjord), Silver, Barium, Bismuth, Indium, Antimony, Tin.

Sediment cores were taken from 16 sites in Sorfjord, West Norway and frozen. The surface 2-cm sections were sampled, dried, and ground for chemical analysis by X-ray fluorescence for the presence of Ag, Ba, Bi, Cd, Cu, In, Pb, Sb, Sn, and Zn. Unusually high concentrations were found; the concentrations of Zn and Pb reached approximately 10 percent by weight in some sediments. The concentrations of most of the elements were positively correlated, those of Pb, Cd, and Cu with Zn being particularly well developed; correlations also existed between Sb and Zn, and Ag and Cu. The concentrations of the metals in the bottom sediments decreased southwards and northwards from a locality close to a source of industrial waste. (Holoman-Battelle)
W73-10865

ABSORPTION OF AMMONIA FROM ATMOSPHERIC PLUMES BY NATURAL WATER SURFACES,
National Environmental Research Center, Research Triangle Park, N.C.
K. L. Calder.
Water, Air, and Soil Pollution, Vol 1, No 4, p 375-380, September 1972. 1 fig, 5 ref.

Descriptors: *Ammonia, *Absorption, *Mathematical models, *Path of pollutants, Model studies, Diffusion, Gases.
Identifiers: *Atmospheric transport, *Water surfaces.

A simple model is presented that incorporates the major features of atmospheric transport and diffusion of a NH3 plume together with aqueous absorption as the plume traverses a water surface. The model is based on the well-known concept of the deposition velocity, although empirical data concerning the latter is quite meager. A specific application is considered to the gas release from a NH3 stripper of a hypothetical sewage treatment plant, and it is concluded that NH3 absorption by adjacent water masses could be considered. (Holoman-Battelle)
W73-10867

HALOGENATED HYDROCARBONS IN AND OVER THE ATLANTIC,
Reading Univ. (England). Dept. of Applied Physical Sciences.
J. E. Lovelock, R. J. Maggs, and R. J. Wade.
Nature, Vol 241, No 5386, p 194-196, January 19, 1973. 2 fig, 1 tab, 6 ref.

Descriptors: *Water pollution, *Water analysis, *Sea water, *Atlantic Ocean, Air pollution, Gases, Organic compounds, Pollutant identification, Water pollution sources, Ecological distribution.
Identifiers: *Halogenated hydrocarbons, *Electron capture gas chromatography, Methyl iodide, Carbon tetrachloride, Aliphatic hydrocarbons, Halomethanes.

A study conducted to compare the observed global distribution of CC13F (a propellant solvent) with the predicted distribution from models of the behavior of an ideal inert gas revealed two halomethanes: methyl iodide and carbon tetrachloride. These 2 compounds and CC13F were uniformly distributed both in air and sea. Analyses were made by gas chromatography using a new electron capture detector which is capable of coulometric measurements. All three gases were found in the air and in the sea wherever and whenever they were sought. CC13F is one of the few substances present and easily measured in the air which is wholly anthropogenic in origin. CH3I is probably a singular product of marine biology and may be a key compound in the natural cycle of iodine between the seas and the land. CC14 seems very likely to be a product of natural inorganic chemistry, possibly the reaction of methane in the troposhere with chlorine in a complex sequence of reactions. This substance also is passed through the environment in quantities exceeding 1 megaton annually. (Holoman-Battelle)

DISTRIBUTION OF VIBRIO PARAHAEMOLYTICUS IN THE NATURAL ENVIRONMENT,
Washington Univ., Seattle. Inst. for Food Science and Technology.
J. Liston, and J. Baross.
Journal of Milk and Food Technology, Vol 36, No 2, p 113-117, February 1973. 5 tab, 35 ref.

Descriptors: *Distribution patterns, *Water pollution effects, Water pollution sources, Path of pollutants, Shellfish, Foods, Sea water, Estuarine environment, Water temperature, Population, Sediments, Plankton, Fish, Organic matter, Oysters, Shrimp, Crabs, Clams, Public health, Coasts, Pacific Ocean, Atlantic Ocean, Reviews, Gulf of Mexico, Pathogenic bacteria, Enteric bacteria, Marine bacteria, Indian Ocean, Hawaii, Australia.
Identifiers: *Vibrio parahaemolyticus, *Tissue, *Macroinvertebrates, Japan, China Sea, Korea, Taiwan, Ceylon, Germany, Denmark, Holland, England, Baltic Sea, Adriatic Sea, France, Spain, Phillipines, India, China.

Vibrio parahaemolyticus has been isolated widely from marine environments but appears to be most abundant in inshore and estuarine areas when ambient temperatures rise seasonally to levels permitting growth of the organism. Japanese and U.S. studies of coastal areas have shown a direct relationship between temperature and abundance of Vibrio parahaemolyticus and this correlates with the seasonal incidence of Vibrio parahaemolyticus food poisoning in Japan. The organism has been isolated from water, sediment, plankton, fish and shellfish. In North America it seems to be most abundant in molluscan shellfish and in waters of high organic content. Counts of 10-200/ml of water, 1-7/g of sediment and up to 100,000/g of oyster tissue have been reported for North American inshore areas. Limited information on market seafood samples indicates very low incidence of Vibrio parahaemolyticus on fin fish in Europe and North America and high incidence in Japan during summer months. Limited data on market samples of frozen and fresh shellfish in U.S.A. suggest sporadically high incidence on shrimp, crabmeat, oysters, and clams. (Little-Battelle)

Identifiers: *Lake restoration, Enhancement, *Vancouver Lake (Wash).

The effects of possible modifications to the Vancouver Lake-Columbia River System on the hydraulic characteristics of that system were tested in a physical hydraulic model. A mathematical model was developed for predictive analysis and to expand the results of the hydraulic model study. Alternate methods for improving flushing action through Vancouver Lake by use of a conduit were investigated. The theories, assumptions, test procedures, data analysis and results as presented are directed towards arriving at conclusions and recommendations regarding proposed hydraulic engineering works and their effects on the hydraulic regime and water quality conditions in Vancouver Lake. The tests were conducted to determine the hydraulic characteristics and the flushing efficiency of pollutants by using a fluorescent dye to simulate the soluble conservative pollutants in the prototype. In addition, the hydraulic model study provided information on the dispersion, mixing, dilution rates and detention times which are important factors influencing water quality. This is Part 1 of a two-part study entitled 'Correlated Studies of Vancouver Lake, Washington.' The other part of the study is Water Quality Prediction conducted by the Sanitary Engineering Section of the College of Engineering Research Division at Washington State University under Project No. 16080 ERQ, details of which are covered in a separate report. Descriptors: Water Quality, *Simulation analysis, *Water Quality Control, Eutrophication, *Dredging, Mud, Washington, *Hydraulic models, *Computer models, Bottom sediments.
Identifiers: *Lake restoration, Lake flushing, *Vancouver Lake (Wash).

This study deals with the restoration of water quality of shallow, polluted, and eutrophic lakes. Dredging and removing of lake bottom sediments and introducing better quality water are the restoration measures explored. Vancouver Lake, Washington, was used as a test case. Hydrologic, hydrographic, hydrodynamic, and water quality information, provided by separate but correlated studies, was combined with the aid of mathematical simulation models. Dissolved oxygen was used as an indicator of the overall water quality in the system. Photosynthesis, atmospheric reaeration, biological respiration, and advection were mechanisms considered in the computation of diurnal changes in dissolved oxygen level. In addition to the DO model, the aquatic life model for computing time-varying levels of phytoplankton and bacteria was also tried. The validity of these models was verified with the actual field data. After verifications of the models under the existin

UNRECORDED POLLUTION SOURCES AND OPTIMUM WATER QUALITY SYSTEMS,
Rutgers - The State Univ., New Brunswick, N.J. Water Resources Research Inst.
W. Whipple, Jr., J. V. Hunter, and S. L. Yu.
In: Proceedings of a national symposium, 'Costs of Water Pollution Control,' North Carolina Research Triangle Universities and Environmental Protection Agency, Raleigh, North Carolina. April 6, 7, 1972, p 101-113 (1972). A-025-NJ (2).

Descriptors: *Organic loading, *Urban runoff, Water quality, Water pollution sources, *New Jersey, *Biochemical oxygen demand, Municipal wastes, Industrial wastes.
Identifiers: *Mass balance analysis, *Unrecorded waste loading, *Water quality modelling, Unrecorded pollution, Nonpoint pollution sources.

It is coming to be generally recognized that there are very large waste loadings in rivers in developed areas, over and above the recorded treatment plant effluents. The origins of unrecorded pollution in developed areas, the policy implications for regional water quality planning, and the method of modelling organic pollution by means of BOD mass balance analysis are discussed. Some 'background' waste loading occurs even in totally undeveloped areas. In level cropped areas and areas of individual family housing in New Jersey, BOD concentrations in dry weather averaged less than 2.0 mg/1 and in wet weather less than 3.0 mg/1. In a residential area which has considerable industry, unrecorded dry weather BOD concentrations averaged 9 mg/1 and wet weather BOD 17. Mass balance analysis will usually be required in order to determine unrecorded BOD in urban areas, unless the entire watershed is urban. The process is basically simple, but, for accuracy, account should be taken of the deviations of the BOD rate from the usually assumed first order reaction.

PESTICIDE-SEDIMENT-WATER INTERACTIONS,
Agricultural Research Service, Chickasha, Okla. Southern Great Plains Watershed Research Center.
H. B. Pionke, and G. Chesters.
Journal of Environmental Quality, Vol 2, No 1, p 29-45 January-March, 1973. 9 fig, 1 tab, 150 ref. OWRR B-016-WIS (16). ARS 12-14-100-8154 (41).

Descriptors: *Pesticides, *Sediments, Aquatic soils, Water pollution sources, Limnology, Aquatic plants, Balance of nature, *Sediment-water interfaces, *Lake sediments, *Reviews.

Pesticide-sediment-water interactions occurring within a watershed and the associated aquatic system are reviewed regarding their impact on the distribution and persistence of pesticides in recipient lakes. Pesticidal persistence on the watershed is discussed initially because the aquatic residue hazard depends largely on the persistence of soil-applied pesticides. Mechanisms of transport from field to aquatic system are reviewed for those compounds not degraded rapidly to nontoxic derivatives. Pesticide transport through the atmosphere, ground water, and surface runoff is traced with particular emphasis on application-associated losses and transport effect on initial pesticide distribution and concentration in the aquatic system. Field and plot studies evaluating pesticide losses in runoff are summarized. Within the aquatic system, limnological, sediment and water characteristics potentially alter the distribution of adsorbed pesticide between water and associated sediment within the lake. Specifically, the effects of pH, lake stratification, characteristics and content of sediment organic matter and clay, and salinity are evaluated. This review concluded with a discussion of literature on pesticide persistence determined in simulated or natural aquatic systems and the interactions between aquatic vegetation, sediment, and water which affect pesticide distribution.

A NOTE ON THE PREDICTION OF BOD PROFILE DUE TO A SOURCE OF EFFLUENT DISCHARGED IN A UNIFORMLY FLOWING STREAM,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
Y. L. Lau.
Water Research, Vol 6, No 7, p 749-757, 1972. 3 fig, 7 ref.

Descriptors: *Diffusion, *Mathematical models, *Biochemical oxygen demand, *Effluents, Streams, Flow profiles, Velocity, Distance, Dispersion, Width, Pollutants, Equations.
Identifiers: Point source model, Plug flow model, Finite width source.

Discharge from a source of pollutant into a uniform stream is analyzed using the two-dimentional diffusion equation with a source of finite width and uniform concentration. Neither the point source model nor the plug flow model can give accurate enough predictions until the concentration has been reduced to a small fraction of the initial value. The danger of not using the proper source strength when applying the point source and plug flow solutions is illustrated. Very close to the source, the plug flow solution can be used to approximate the maximum concentration assuming a certain source of concentration across the whole river. If the effluent concentration is high enough so that far downstream, after the pollutant has essentially dispersed, the concentration level is still significant, the plug flow model can again be used. The distance required for lateral mixing is dependent upon stream characteristics and width of source. It also varies with degree of cross-stream variation one can tolerate. Although the plug flow model can give satisfactory approximation under special circumstances, the finite width source solution should be used since the expression is still very simple and the error function has been well tabulated. RELEASE OF AMMONIUM-N FROM SEDIMENTS TO WATERS,
Wisconsin Univ., Madison. Dept. of Soil Science.
B. H. Byrnes, D. R. Keeney, and D. A. Graetz.
International Association of Great Lakes Research, Proceedings 15th Conference on Great Lakes Research, p 249-259, 1972. 3 fig, 7 tab, 13 ref.

Descriptors: *Ammonia, *Sediments, *Freshwater, Lakes, Wisconsin, Eutrophication, Nitrogen, Nutrients, Sediment-water interchange.
Identifiers: Lake Mendota (Wis.), Lake Tomahawk (Wis.).

Lboratory and field investigations of the rate of NH4-N movement within freshwater lake sediment profiles and transformations within and release of NH-4N to waters from sediments were conducted on Lake Mendota, a moderately eutrophic hard water lake in southcentral Wisconsin and on Lake Tomahawk, an oligotrophic lake in northeastern Wisconsin. The results of this investigation indicate that: (a) the exchange sequence: interstitial H2O NH4-N and lake H2O NH4-N will proceed to the right and (b) while the surficial layer (0-4 cm) of sediment seems to serve as the immediate source of NH4-N to the overlying waters, as much as 16 cm of sediment can be considered as a source of NH4-N to the overlying waters. SIMPLIFIED METHOD OF OCEAN OUTFALL DIFFUSER ANALYSIS,
Montgomery (James M.) Consulting Engineers, Inc., Pasadena, Calif.
J. L. Chao, and C. M. Campuzano.
J Water Pollut Control Fed. Vol 44, No 5, p 806-812, 1972. Illus.
Identifiers: *Diffusion, Discharge (Waste water), Ocean, *Outfall, Waste water disposal.

A simplified method of calculating friction loss through a (wastewater) diffuser with a continuous lateral discharge was developed. This method is especially useful during the preliminary planning stage of an engineering project. It can be applied to diffusers with uniform, stepwise and uniformly varying discharges from their ports. Accuracy of the simplified method was verified with existing data to a satisfactory degree.--Copyright 1972, Biological Abstracts, Inc.

Identifiers: *Bacterial populations, Enterobacteriaceae, Aeromonas, Achromobacter, Flavobacterium, Xanthomonas, Cytophaga, Fecal pollution, Potassium permanganate consumption, Orthophosphates, Carbon chloroform extract, Organic nitrogen, Fecal streptococci.

Polluted river water was treated by lagooning in an experimental bed. The evolution of the most representative parameters of the organic and bacterial pollution has been studied in relation to the period of retention. The predominant bacterial populations have been identified and their qualitative and quantitative variations have been related to the degree of pollution. The analytical results are commented upon and the advantages of the method are stressed. (Holoman-Battelle)

A PRELIMINARY INVESTIGATION OF ORGANIC-INORGANIC ASSOCIATIONS IN A STAGNATING SYSTEM,
Georgia Univ., Athens. Dept. of Zoology.
J. E. Schindler, J. J. Alberts, and K. R. Honick.
Limnology and Oceanography, Vol 17, No 6, p 952-957, November 1972. 5 fig, 1 tab, 11 ref. OWRR A-029-GA (6).

Descriptors: *Sediments, *Sediment-water interfaces, *Oxidation-reduction potential, *Heavy metals, Sorption, *Hydrogen ion concentration, Filtration, Iron, Zinc, Manganese, Magnesium, Sampling, Separation techniques, Path of pollutants, Water analysis, *Georgia.
Identifiers: *Molecular weight fractionation, Transport, Membrane filters, Mobilization, Organic carbon, *Lago Pond (Geo).

Undisturbed water samples were collected from Lago Pond in Georgia using a free-fall corer fitted with a plastic insert which could be easily removed and serve as a microcosm of the sediment for use in molecular weight fractionation studies. The purpose was to examine the possibility of organic-inorganic complex formation as a mechanism for mobilization of metals during stagnation of a lake sediment system. Portions of the samples were withdrawn at various locations and at certain intervals based on redox potentials and pH values. The portions were passed through membrane filters which retained material with molecular weights of 100,000, 50,000, 10,000, 2,000, and 50. Replicate aliquots of water fractions were analyzed for organic carbon. The remainder of each water fraction was analyzed for Fe, Mg, Mn, and Zn by AA. Unfiltered samples were analyzed for organic carbon and the aforementioned metals. The concentration of each element retained in the molecular weight fractions was calculated by subtracting from the concentration in the next larger size sample. Total inorganic carbon of the aqueous phase was determined by infrared gas analysis. The results showed that (1) inorganic carbon increased during reduction; (2) organic carbon fractions were more evenly distributed by molecular weight during reduction; (3) Fe, Mg, and Mn were associated with the 10,000-50,000 molecular weight fraction during reduction; and (4) only Zn was associated with the 0-500 molecular weight fraction. It is suggested that the association of the elements studied with colloid-forming materials could impart a stability which would permit their transport to oxygen-rich, productive areas of lakes. DISSOLVED OXYGEN AND TEMPERATURE IN A STRATIFIED LAKE,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
S. A. Smith, and D. A. Bella.
Journal Water Pollution Control Federation, Vol 45, No 1, p 119-133, January 1973. 14 fig, 2 tab, 21 ref. OWRR A-003-ORE (7).

Descriptors: *Dissolved oxygen, *Water temperature, *Thermal stratification, Hypolimnion, Mixolimnion, Water properties, Water quality, Data collections, Water sampling, Epilimnion, Chemical analysis, Water analysis, *Oregon, Lakes, Hydrogen ion concentration, Alkalinity, Acidity, Suspended solids, Turbidity, Ammonia, Nitrates, Nitrites, Nitrogen, Phosphorus, Turnovers.
Identifiers: *Diel variations, *Triangle Lake (Ore), Metalimnion, Chlorophyll a, BOD5, Kjeldahl nitrogen, Orthophosphates.

Temporal and spatial variations of temperature and dissolved oxygen were measured in Triangle Lake in Oregon. The lake was relatively uniform in the horizontal direction and significantly stratified vertically. Diel dissolved oxygen variations were less than 0.5 mg/l in surface regions. Diel temperature variations resulted in a nocturnal density overturning extending to about 9 ft (3 m) in depth. Depth of summer diel overturning defined the lower boundary of the epilimnion and upper boundary of metalimnic dissolved oxygen maximum. Complete overturn did not occur during the mild winter of 1969-70, and low hypolimnetic dissolved oxygen values occurred the following summer. During summer months, desirable game fish habitats in the lake are restricted by temperature and oxygen conditions. (Holoman-Battelle)

RADIATION-RESISTANT MUTANTS OF SALMONELLA TYPHIMURIUM LT2: DEVELOPMENT AND CHARACTERIZATION,
Massachusetts Inst. of Tech., Cambridge. Dept. of Nutrition and Food Science.
R. Davies, and A. J. Sinskey.
Journal of Bacteriology, Vol 113, No 1, p 133-144, January 1973. 5 fig, 7 tab, 46 ref.

Descriptors: Resistance, *Radiation, *Pollutant identification, Gamma rays, Cultures, Antibiotics (Pesticides), Genetics, Ultraviolet radiation, Proteins, Enzymes, Chemical analysis, Aerobic bacteria, Enteric bacteria, Coliforms, Pathogenic bacteria.
Identifiers: *Biochemical characteristics, *Mutants, Bacterial physiology, *Salmonella typhimurium LT2, Characterization, Salmonella typhimurium, Biochemical tests, Serological methods, Phage typing , Sensitivity, Survival, Culture media, RNA, DNA polymerase.

A series of repeated exposures to gamma irradiation with intervening outgrowth of survivors was used to develop radioresistant cultures of Salmonella typhimurium LT2. Stepwise increases in resistance to both ionizing and ultraviolet irradiation were obtained independently of the presence or absence of integrated P22 prophage. Single clonal isolates, representing parent and radioresistant populations, retained the general characteristics of the LT2 parent, including serological properties, phage typing, antibiotic sensitivities, mouse virulence, and most biochemical test reactions. Resistant cells were generally larger and contained 1.8 to 2.1 times more ribonucleic acid and protein than parent cells, but deoxyribonucleic acid (DNA) contents were similar. Heterogeneity in the populations with respect to release of H2S, utilization of carbon sources, and growth on minimal medium is considered to be ancillary, rather than causally related, to increased radioresistance. The resistant isolates displayed an increased ablity to reactivate gamma-irradiated P22 phage. DNA polymerase I and polynucleotide-joining enzyme activities were elevated in extracts of radioresistant cells relative to parent cells. It is suggested that the observed increases in radioresistance result from a selection of mutations leading to an increased capacity to repair DNA. (Holoman-Battelle)

MICROBIAL DECOMPOSITION OF PENTACHLOROPHENOL,
Purdue Univ., Lafayette, Ind. School of Civil Engineering.
E. J. Kirsch, and J. E. Etzel.
Journal Water Pollution Control Federation, Vol 45, No 2, p 359-363, February 1973. 4 tab, 9 ref.

Descriptors: *Microbial degradation, *Wood preservatives (Pesticides), *Cultures, Microorganisms, Radioactivity techniques, Bioassay, Radiochemical analysis, Biodegradation, Carbon dioxide, Carbon radioisotopes.
Identifiers: *Pentachlorophenol, *Fate of pollutants, Sodium pentachl orophenate, Bacterial populations, Substrate utilization, Degradation products, Heterotrophy, Acclimatization, Biocides, Chemical recovery, C-14, Culture media, Scintillation counting.

A soil sample was obtained from the grounds of a wood products manufacturer in Terre Haute, Indiana, who used pentachlorophenol (PCP) and added to nutrient broth in order to obtain definitive evidence of PCP biodegradation in heterogeneous cultures of microorganisms. The biodegradation of sodium pentachlorophenate was observed in both proliferating and nonproliferating mixed bacterial populations that had previously received lengthy acclimation to the biocide. Definite proof of dissimilation was obtained by measuring the release of C-1402 from radioactive sodium pentachlorophenate. The maximum yield of CO2 in a 24-hr exposure period was 68 percent in nonproliferating cultures. The rate and extent of decomposition in proliferating cultures was significant but less than found in nonproliferating cultures. Spontaneous, nonbiological decomposition of sodium pentachlorophenate was observed but did not exceed 0.1 percent in a 48-hr reaction period. (Holoman-Battelle)

ENHANCEMENT OF NET PRIMARY PRODUCTIVITY BY HERBIVORE GRAZING IN AQUATIC LABORATORY MICROCOSMS,
State Univ. of New York, Binghamton. Dept. of Biological Sciences.
D. C. Cooper.
Limnology and Oceanography, Vol 18, No 1, p 31-37, January 1973. 4 fig, 1 tab, 22 ref.

Descriptors: *Bioassay, *Cycling nutrients, *Fish, *Grazing, *Primary productivity, Biomass, Dominant organisms, Chlorophyta, Cyanophyta, Anabaena, Rotifers, Crustaceans, Zooplankton, Phytoplankton, Succession, Standing crops.
Identifiers: Notropis spilopterus, Spirogyra, Testudinella, Gastropus, Ceriodaphnia reticulata, Cyclops, Epischura, Aphanizomenon.

The role of herbivore grazing intensity as a factor affecting net primary productivity was investigated by introducing varying biomasses of a starved herbivore (Notropis spilopterus) into replicate autotrophic microcosms. The microcosms consisted of 15 aquaria containing 15 l of sediment from a eutrophic pond. After 20 days, the enhancement of net primary productivity in the experimental microcosms was directly related to herbivore biomass up to a certain density and inversely related above this. The relationship approximates the first derivative of a sigmoid population growth model. Enhancement of primary production under these experimental conditions appears to be due to reductions of standing crop and increased turnover rates of producer populations. The results suggest that these responses were independent of increased nutrient regeneration rates brought about by grazing. (Little-Battelle)

atterns, *Primary productivity, Lakes, Solar adiation, Algae, Anabaena, Diatoms, Sampling, Diel migration.
Identifiers: Sample preservation, Periodicity, Mountain lakes, Gymnodinium uberrimum, Desmids, Mallomonas, Synedra nana, Tetraedron, Cryptomonas ovata, Dinobryon sertularia, Synura Petersenii, Gymnodinium cf. lacustre, Peridinium Ciculiferum, Certain hirundinella, Cryptomonas Marsonii, Glenodinium.

Diurnal changes in phytoplankton stratification nd photosynthesis of high mountain lakes (Vorerer Finstertaler See) were studied at all seasons. he dominant flagellates usually ascend in the vening and at night and migrate downward with ncreasing light intensities. Maximum migratory peeds are higher than 1 m/hr and almost indepenent of cell size. The vertical stratification pattern f flagellates is the result of varying upward and ownward migrations, but the vertical stratificaons of nonmotile species depend on the turbunce of the water. Over the day the mean hotosynthesis of the entire water column varies about the same proportions as the input of light nergy. At a given depth algae seem to be adapted the daily mean value of light intensity. Near the ke surface, around noon (1000-1400 hours), hotosynthesis is considerably reduced due to ownward migration, light saturation, and light inibition--all caused by high light intensities--but at reater depths the utilization of light energy requently is increased. During low light periods arly morning, evening) suboptimal light intensies in deeper layers of the lake cannot be utilized effectively. By phototactic verticle migrations, he diurnal shifts of light energy utilization can be artly compensated. (Little-Bettelle)

Identifiers: Data interpretation, *Chlorophyll a.

Data collected as part of the International Biological Program from 43 lakes and 12 reservoirs, distributed from the tropics to the arctic, were subjected to statistical analysis to establish which factors are important in controlling production and how they are related. In the whole body of data, variables related to solar energy input have a greater influence on production than variables related to nutrient concentration; in lakes within a narrow range of latitude, nutrient-related variables assume greater importance. Morphological factors have litte influence on productivity per unit area in either case. Chlorophyll a concentration is a good indicator of nutrient conditions and when combined with an energy-related variable constitutes a good estimator of primary production. (Little-Battelle)

Identifiers: Data interpretation, Substrate utilization, Species diversity.

It is shown by use of a mathematical model that heterogeneous populations do not adhere to the Michaelis and Menten equation; at low substrate concentration, observed rates are higher than predicted ones. The discrepancy between observed and predicted values increases as the population becomes more diverse. If kinetic analysis based on the Michaelis and Menten equation is used to determine the rate of turnover of substrates in natural waters, the rate may be underestimated unless measurements are made at very low added substrate concentration. (Little-Battelle)

METHODS OF ESTIMATING THE HALF-LIFE OF BIOLOGICAL ACTIVITY OF TOXIC CHEMICALS IN WATER,
Bureau of Sport Fisheries and Wildlife, La Crosse, Wis. Fish Control Lab.
L. L. Marking.
Investigations in Fish Control Report No 46, July 1972. 9 p, 2 fig, 3 tab, 5 ref.

Descriptors: *Antimycin A, *Pescicides, *Bioassay, *Water pollution effects, *Pesticide toxicity, *Methodology, Fish control agents, Rainbow trout, Channel catfish, Pesticide kinetics, Freshwater fish, Sunfishes, Hydrogen ion concentration, Hardness (Water), Mortality.
Identifiers: Biological activity, Half-life, Green sunfish, Goldfish, Median tolerance limit, Carassius auratus, Ictalurus punctatus, Lepomis cyanellus, Salmo gairdneri.

In the absence of analytical methods, the half-life of biological activity of a chemical (the time required to decrease its toxic activity by one-half) can be extimated by bioassays. The methods presented require the determination of LC50 values (concentration producing 50 percent mortality) for organisms in aged solutions containing unknown residual concentrations. The half-life of biological activity is determined by plotting (1) the percent concentrations remaining in aged solutions or (2) the deactivation indices against aging time on cyclic semilogarithmic graph paper. By the first method, a 5-day half-life for antimycin, a fish toxicant, was determined using resistant channel catfish (Ictalurus punctatus) and goldfish (Carassius auratus) and for sensitive green sunfish (Lepomis cyanellus) and rainbow trout (Salmo gairdneri) in soft water at pH 7.5. The second method, using only rainbow trout, also estimated a 5-day half-life for antimycin in soft water at pH 7.5. These methods could be used also to determine the half-life of antimycin at different pH's, temperatures, and light intensities, the factors thought to influence the toxicant's efficacy. The methods are not limited to fish and fish toxicants. (Holoman-Battelle)

Identifiers: *DMA-2 4-D, Tissue, Bioaccumulation, Sample preparation, *Gas liquid chromatography, Channel catfish, Lepomis macrochirus, Largemouth bass, Fathead minnow, Blood, Brain, Excretion, Scintillation counting, Gills, Bile, Liver, Kidney, Muscle,Fat, Pyloric caeca, Testes, Hydrosol, Biological magnification.

The uptake, distribution, and dissipation of C-14-labeled dimethylamine salt of (2,4-dichlorophenoxy)acetic acid (DMA-2,4-D) from water by three species of fish was studied concurrently with the dissipation of DMA-2,4-D from water and hydrosol. Fish were exposed to 0.5, 1.0, or 2.0 mg/l. concentrations of herbicide for up to 84 days. Radioactive residues of 2,4-D were determined by radiometric procedures in eight or more tissues and organs. Residues of 2,4-D were determined in muscle and whole-body extracts by gas chromatography. Radioactive residues were found in all fish tissues and organs analyzed, but actual 2,4-D content was negligible in muscle, indicating that most of the C-14-residue was a metabolite (s) of 2,4-D. Residues of 2,4-D declined in water to

BIOLOGICAL NITROGEN FIXATION IN THE GREAT LAKES,
Wisconsin Univ., Madison, Dept. of Biochemistry.
T. H. Mague, and R. H. Burris.
BioScience, Vol 23, No 4, p 236-239, April 1973. 3 fig, 3 tab, 18 ref.

Descriptors: *Nitrogen fixation, *Great Lakes, *Phytoplankton, Water sampling, Oligotrophy, *Eutrophication, Nitrogen cycle, Cycling nutrients, Cyanophyta, Lake Erie, Lake Huron, Lake Superior, Lake Michigan, Methodology, Diatoms, Chrysophyta, Anabaena, Dinoflagellates, Pyrrophyta, Chlorophyta.
Identifiers: Green Bay, *Acetylene reduction, Flame ionization gas chromatography, Sample preparation, Asterionella formosa, Fragilaria, Tabellaria, Oscillatoria, Aphanizomenon flos-aquae, Microcystis aeruginosa, Lyngbya, Pediastrum, Ceratium hirundinella, Van Dorn bottles, Ethylene.

The acetylene reduction technique was used for assessing potential N2-fixation in lake water samples. Water samples from Green Bay and Lakes Erie, Superior, Huron and Michigan were passed through a 64-micron silk plankton netting to concentrate the phytoplankton prior to testing. One-ml samples of the concentrate were transferred to glass serum bottles to which acetylene was added directly without other modification of the atmosphere. The bottles were incubated for approximately 30 min; acetylene reduction was terminated by the addition of 5 N H2SO4 and the serum stoppers were sealed against possible leakage. Four replicate bottles were prepared from each sampling site, and one was immediately inactivated with acid to serve as a control. The quantity of ethylene was determined by flame ionization after gas chromatographic separation from acetylene on a 1.2 m x 2 mm column of Poropak N run at 75 degrees C. Acetylene reduction by the phytoplankton in Lake Superior, the western end of Lake Huron, and eastern Lake Michigan was barely detectable in September of 1970, but in southern Green Bay of Lake Michigan and the shallow basin of Lake Erie it was comparable in rate to that in eutrophic Wisconsin lakes. Acetylene reduction activity in Green Bay was low in the mouth of the main tributary, increased to a maximum 5-15 km northeast into the bay, and then decreased farther northeast. Vigorous acetylene reduction was always associated with an abundance of heterocystous blue-green algae. (Holoman-Battelle)

A FIELD FIXATION TECHNIQUE FOR DISSOLVED PHOSPHATE IN LAKE WATER,
Minnesota Univ., Minneapolis. Limnological Research Center.
J. Shapiro.
Limnology and Oceanography, Vol 18, No 1, p 143-145, January 1973. 4 tab, 2 ref.

Descriptors: *On-site investigations, *Solvent extractions, *Phosphates, Spectrophotometry, Pollutant identification, Chemical analysis, Lakes, Chelation, Chemical reactions, Color reactions.
Identifiers: *Sample preservation, *Orthophosphates, Accuracy, Natural waters, *Sample storage, Sample preparation, Isobutanol, Phosphomolybdic acid.

Natural water samples containing dissolved orthophosphate may be fixed in the field and analyzed for orthophosphate in the laboratory as much as 2 weeks later. This fixation method involves adding reagents to the water sample and extracting the phosphomolybdic acid formed into isobutanol within 30 sec. In the laboratory the phosphomolybdate in isobutanol was washed with dilute HCl, made to volume, and stannous chloride was added to reduce the compound to its blue form. The color was read in a spectrophotometer and compared with standards. Storage of the samples for 7 days results in values that are at most 15 percent different from the initial values; after 2 weeks the greatest deviation was less than 20 percent. With this fixation method, it is not necessary to keep the extract in the dark. No special preservation methods are necessary either for the water samples or the extracts, and instead of carrying water samples back from the field one need bring back only small vials of extract. A STUDY OF THE INFLUENCE OF CALCIUM ON THE EFFECTS OF DDT ON FISHES,
Mississippi Univ., University.
L. R. Keffler.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106, Order No. 73-1275. Ph D Dissertation, 1972. 131 p.

Descriptors: *Calcium, *DDT, Water pollution effects, *Bioassay, *Poisons, *Pesticide toxicity, Freshwater fish, Chlorinated hydrocarbon pesticides, Laboratory tests, Insecticides.
Identifiers: *Goldfish, *Golden shiner, Carassius auratus, Notemigonus crysoleucas.

Investigations were undertaken dealing with a likelihood of a relationship between calcium deficiency and DDT poisoning. Goldfish, Carassius auratus, and golden shiners, Notemigonus crysoleucas, were tested using sixteen different combinations of calcium and DDT concentrations. Because of the possibility of influence by the accompanying anion, three different salts were used as sources of the calcium ion. A series of different experimental tests indicated good probability of the suspected relationship between calcium and DDT. Fishes poisoned with DDT in the laboratory were observed to give evidence of all the symptoms of calcium deficiency. Increasing the concentration of calcium ions in the water from 0 to 200 ppm seemed to alleviate the DDT poisoning symptoms of fishes and decrease the death rate, when the DDT concentration did not exceed 20 ppb. Goldfish were more responsive to treatment than were golden shiners. Of the calcium salts used calcium chloride was more effective than either calcium carbonate or calcium gluconate. Two possible conclusions to be drawn are that DDT is not simply a neurotoxin, and that the calcium differences between hard and soft water may be sufficient to give a survival advantage to fished in the hard water regions of the country. THE CARBON CYCLE IN THE EPILIMNION OF TWO MICHIGAN LAKES,
Michigan State Univ., East Lansing.
M. C. Miller.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106, Order No. 73-5446. Ph D Dissertation, 1972. 233 p.

Descriptors: *Biological communities, *Cycling nutrients, *Essential nutrients, *Carbon cycle, *Epilimnion, Water pollution sources, Metabolism, Benthos, Model studies, Lakes, Primary productivity, Nutrient requirements, Standing crops, Sedimentation rates, Michigan, Degradation (Decomposition), Limiting factors, Absorption.
Identifiers: *Dissolved organic carbon, *Particulate organic carbon, Substrate utilization, Heterotrophic nutrition, Oxygen depletion, Glucose, Acetates, Glycolates.

The planktonic communities of two contrasting lakes were examined to quantify budgets and dynamics of dissolved and particulate organic carbon. Rates of primary production, extracellular secretion, particulate carbon sedimentation, input of humic material, heterotrophic uptake of glucose, acetate and glycolate, and oxygen depletion were determined in relation to simultaneous measurements of standing crops of algal carbon, total dissolved, and particulate organic carbon and humic organic carbon. Benthic metabolism affected the planktonic heterotrophs more in the shallower lake. In general, the heterotrophic uptake of small organic molecules varied directly with planktonic algal production and secretion. The size of the particulate organic carbon pool was proportional to the rates of primary production. The size of the dissolved organic carbon pool was apparently related inversely to the amounts of limiting nutrients. In the deeper of the two lakes the inputs of dissolved organic carbon into the surface waters ranked by importance were: autolysis and algal cell rupture, runoff in rainwater, secretion by and decomposition of aquatic plants, phytoplankton secretion, and particulate organic carbon decomposition in the water column. Rates of transfer and organic carbon pools are discussed and a model integrating these results is presented. (Holoman-Battelle)
W73-10538

THE EFFECT OF CALCIUM ON GROWTH AND MORPHOGENESIS OF CHLORELLA, GOLENKINIA, AND SCENEDESMUS,
Washington State Univ., Pullman.
H. Rahimian.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor, Mich., 48106, Order No. 73-73. Ph D Dissertation, 1972. 89 p.

Descriptors: Water pollution effects, *Calcium, *Plant morphology, *Aquatic algae, *Plant physiology, Plant growth, Strontium, Aquatic plants, Alkaline earth metals, Cultures, Enzymes, Bioassay, Chelation, Limiting factors.
Identifiers: Ethyleneglycol bisaminoethylether tetraacetic acid, Barium, *Chlorella pyrenoidosa, *Scenedesmus obliquus, *Golenkinia minutissima, Culturing techniques, Enzyme activation, Uridine diphosphoglucose pyrophosphorylase, Uridine diphosphoglucose fructose transglucosylase.

Morphogenetic effects of calcium on Chlorella pyrenoidosa, Scenedesmus obliquus, and Golenkinia minutissima strains 929 and 930 were studied, as were the effects of strontium, barium, and ethyleneglycol bisaminoethylether tetraacetic acid (EGTA) on Scenedesmus. Inoculated cells were starved in a calcium-free medium for one week before the time of inoculation. Organisms were grown under controlled conditions at a temperature of about 20 C and illuminated with an intensity of 350 ft-c from cool-white fluorescent lamps regulated to provide 16 hours of light and 8 hours of darkness. Cultures were aerated with a mixture of 3 percent CO2 in air. Growth was measured in

terms of increase in the cell population and increase in the amount of fresh and dry matter. The results were as follows: (1) Calcium was shown to be necessary for production of the maximum number of cells in each species studied. (2) In the presence of Ca the cultures yielded a greater weight production and greater dry weight per gram of fresh weight than in the absence of Ca. (3) In the presence of Ca the starch content of cells was greater. (4) The K/Na ratio in the cells was greater in the presence of Ca. (5) The number of cells produced was significantly decreased when Sr or Ba was substituted. (6) Calcium played a role in cell morphology. (7) Calcium was shown to be necessary for colony formation in Scenedesmus. (8) Cell size was found to be inversely proportional to the number of cell production. (9) Seta formation in Golenkinia was shown to require Ca. (10) In the presence of higher than 0.6 mM of EGTA, a specific chelating agent for Ca, the algal cells died. (11) It is hypothesized that Ca is required for activating enzymes involved in wall formation and cell division as well as for maintaining membrane integrity. This has already been established for uridine diphosphoglucose pyrophosphorylase and uridine diphosphoglucose fructose transglycosylase which function in wall formation. (Holoman-Battelle)

POPULATION DYNAMICS AND THE EFFECT OF INORGANIC IONS ON CERTAIN MICROCRUSTACEA,
Cincinnati Univ., Ohio.
C. B. Carpenter.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor Mich., 48106, Order No. 73-3824. Ph D Dissertation, 1972. 108 p.

Descriptors: *Crustaceans, *Zooplankton, *Bioassay, *Sodium compounds, *Potassium compounds, Environmental effects, *Cations, Invertebrates, Carbonates, Ponds, Waterfleas, Copepods, Laboratory tests, Freshwater, Water sampling, Water temperature, Dissolved oxygen, Carbon dioxide, Light intensity, Air temperature, Allalinity, Hydrogen ion concentration, Sodium chloride.
Identifiers: Population density, Data interpretation, Median tolerance limit, Chemical indicators, Methyl orange, Phenophthalein, Nauplii, Daphnia pulex, Daphnia magna, Ceriodaphnia reticulata, Bosmina longirostris, Diaptomus spp, Daphnia spp, Potassium chloride, Sodium bicarbonate, Potassium bicarbonate, Sodium hydroxide, Potassium hydroxide, Sodium carbonate, Potassium carbonate, Factorial analysis.

Some of the primary and most important microcrustacean species were used in a field study of freshwater ponds with reference to seasonal changes in population density and effects of environmental conditions. Samples taken from two fresh-water ponds were analyzed for numbers of microcrustacea per liter of pond water, pH, water temperature, air temperature, dissolved oxygen, total alkalinity (methyl orange), carbonate alkalinity (phenolphtalein), bottom dissolved oxygen, free carbon dioxide and light intensity at the surface of the pond. The representative microcrustacea were Bosmina longirostris, Ceriodaphnia reticulata, Daphnia spp., Diaptomus spp., and copepoda nauplius larvae of unidentified species. Because of high negative correlations with the alakalinity parameter laboratory studies were executed to determine the effects of the component ions on the organisms in a controlled testing regime. LD-50 values were determined for nine clones (6 Daphnia magna, 2 Daphnia pulex, and 1 Ceriodaphnia reticulata) when they were exposed to NaCl, KCl, NaHCO3, KHCO3, NaOH, KOH, Na2CO3 and K2CO3. Factorial analysis of the data was used to determine the extent of each main cation and anion effect and any interaction effects. On the basis of the factorial analysis, the negative correlations between the organisms and the alkalinity parameters are valid with respect to information from both lab tests and field data. THE RELATIONSHIP BETWEEN IONS AND CILIARY ACTIVITY IN THE GILL OF MYTILUS EDULIS,
Fordham University, Bronx, N.Y.
B. H. D. Felton.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor Mich., 48106, Order No. 73-1475. Ph D Dissertation, 1972. 198 p.

Descriptors: *Cations, *Anions, *Inhibition, Water pollution effects, *Animal physiology, Halides, Heavy metals, Alkaline earth metals, Alkali metals, Clams, Sodium, Potassium, Calcium, Magnesium, Chlorides, Manganese, Inhibitors, Mollusks, Invertebrates.
Identifiers: *Mytilus edulis, *Ciliary activity, Excitation, Tetrodotoxin, Lithium, Barium, 5-Hydroxytryptamine, Calcium electrode, Ion selective electrodes, Gills, Caffeine, Macroinvertebrates, Ca-145, Calcium radioisotopes, Scintillation counting, Choline.

Previous authors have reported that ions stiumlate or inhibit ciliary activity in Mytilus edulis. This investigation attempts to clarify the relationship between the major ions in artificial sea water (ASW) of normal balance to the beating of lateral cilia and other types of cilia in the excised gill of Mytilus edulis. ASW was used to perfuse a ganglion-nerve gill preparation. The rate of ciliary beating was determined by timing the metachronal waves with a stroboscope. The effect of Na, K, Ca, Mg and C1, on the basal beat frequency and on the cilioexcitatory effect of 5-hydroxytrptamine (5-HT), KC1, and caffeine was determined. Li, Ba, Mn were studied for the same effects. By replacing the ions in ASW of normal balance with substitutes, such as other ions, choline, gluconate salts, or sorbitol, it was possible to detect the influence of the major ions. Tetrodotoxin (TTX) 0.000016 M does not inhibit ciliary activity of the gill in ASW. In a 1:1 choline/Na ASW, TTX 3 microM (1 microgram/ml) inhibits lateral cilia and blocks the cilioexcitatory effect of KC1. Li 42 mM is cilioinhibitory and also blocks excitation by 5-HT. Nerve stimulation with electrical current is partially blocked by Li. The addition of 5-HT to gills in ASW causes a rapid efflux of Ca from the gill tissue followed by an influx of Ca. The Ca efflux and influx in gill tissue was measured with a Ca selective electrode and also with Ca-45 in a scintillation counter. Caffeine was cilioexcitatory in this investigation, and was tested by the same methods described for 5-HT. When Mn was substituted for Ca in the presence of TTX in 1:1 choline/Na ASW, cilioexcitation by 5-HT and caffeine were not blocked. When Ba or Mn is substituted for Ca in ASW, the basal beat frequency is elevated. The effect of excess ions on the basal beat frequency and on the cilioexcitatory effect of 5-HT was also studied. 5-HT, a known cilioexcitatory agent and metabolic activator in Mytilus gill, has now been shown to cause a change in the membrane permeability of gill tissue to Ca. 5-HT causes a rapid efflux followed by an influx of Ca from internal stores of the ion in gill tissue.This indicates that the chain of events initiated by 5-HT in gill tissue of Mytilus edulis involves Ca release, increased glycolysis, and the formation of ATP which results in cilioexcitation. DIATOMS IN ALKALINE, SALINE LAKES: ECOLOGY AND GEOCHEMICAL IMPLICATIONS,
Duke Univ., Durham, N.C. Dept. of Zoology.
R. E. Hecky, and P. Kilham.
Limnology and Oceanography, Vol 18, No 1, p 53-71, January 1973. 7 fig, 4 tab, 52 ref.

Descriptors: *Diatoms, *Saline lakes, *Alkalinity, *Dominant organisms, *Lake sediments, Chrysophyta, Aquatic algae, Geochemistry, Limnology, Water chemistry, Water sampling, Bottom sampling, Biological communities, Plant populations, Shallow water, Meromixis, On-site data collections, Hydrogen ion concentration, Calcium, Chlorides, Magnesium, Phosphates, Silica, Conductivity, Sodium, Potassium, Sulfates, Fluorides, Water analysis, Chemical analysis, Bicarbonates, Carbonates, Benthic flora, Ecology, Systematics, Classification.
Identifiers: *East Africa, Light microscopy, Sample preservation, Sample preparation, Silicon, Atomic absorption spectrophotometry, Ekman dredge, Cyclotella meneghiniana, Coscinodiscus rudolfi, Navicula elkab, Nitzschia frustulum, Nitzschia sigma, Anomoeoneis sphaerophora, Rhopalodia gibberula, Nitzschia hungarica, Fragilaria pinnata, Eunotia, Stauroneis, Achnanthes exigua, Achnanthes lanceolata, Amphora coffeaeformis, Amphora ovalis.

Six diatoms achieved dominance in 26 alkaline, saline lakes in East Africa. There is a pronounced tendency for these species to replace each other as alkalinity increases. Cyclotella meneghiniana is usually dominant in less concentrated lakes and Nitzschia frustulum is favored as the alkalinity exceeds 80 meq/liter. Coscinodiscus rudolfi and Navicula elkab are occasionally dominant at intermediate alkalinities. Navicula elkab is usually subdominant when N. frustulum is dominant. Most of these species when dominant are considered functionally planktonic in these waters. The presence of the cyanophyte Oscillatoria (Arthrospira) platensis in bloom seems to be a prerequisite for N. elkab and N. frustulum to enter the plankton. There is some evidence that the anionic composition of these lakes may be selective for some of the benthonic species. Geochemical data indicate that the production and preservation of diatom frustules appear to control silica concentrations in the waters. Relatively poor correlations were observed between sodium and silica and between pH and silica. These data have important implications for theoretical models of geochemical evolution in closed basins. Little or no dissolution of fossil diatom frustules was observed in the sediments of these highly alkaline, high pH waters. (Holoman-Battelle)

Identifiers: *Polychaetes, *Arenicola marina, Contaminant concentrations.

Populations of the marine polychaete Arenicola marina were contaminated with cobalt-60 from wastes of the nuclear power industry. Three vectors were suggested: water, substrate, sediments, and organic material in the sediments (Arenicola is a suspension feeder). Such organisms concentrate

LIBRARY OF U. OF ILL. URBANA-CHAMPAIGN

cobalt-60 to a high degree in their blood. The method of contamination was studied experimentally in water contaminated with chloride of cobalt-60. Results of the contaminant conentration studies indicated water passing over the sediments as the vector. The concentration of radioactivity at the digestive tube levels in the worms indicated that contaminants are concentrated in the organic material in sediments and then ingested. A marked increase in level of radioactivity was noted. (Ensign-PAI)

THE LIMNOLOGY OF STOCKBRIDGE BOWL, STOCKBRIDGE, MASSACHUSETTS,
Massachusetts Univ., Amherst. Dept. of Zoology.
S. D. Ludlam, K. S. Hutchison, and G. E. Henderson.
Available from the National Technical Information Service as PB-221 021, $3.00 in paper copy, $0.95 in microfiche. Massachusetts Water Resources Research Center Completion Report FY-73-4, (1973). 63 p, 4 fig, 16 tab, 38 ref. OWRR A-044 MASS (1).

Descriptors: *Eutrophication, *Paleolimnology, *Calcium, *Silica, *Aquatic productivity, Dissolved oxygen, Sedimentation rates, Lake sediments, Water temperature, Phytoplankton, Algae, Diatoms, Aquatic plants, Lake morphology, *Massachusetts.
Identifiers: New England Lakes, Berkshire Lakes, *Stockbridge Bowl (Mass).

Stockbridge Bowl is a eutrophic hard-water lake. Mean annual gross primary productivity was ca. 4.9 g C per square meter per day. Microcoleus lyngbyaceus dominated the phytoplankton through much of the year and formed a productive metalimnetic plate during summer stratification. Silica never became limiting to diatom growth, despite a spring diatom pulse. Silica, calcium and magnesium all showed inverse clinograde distributions during periods of stratification and values in the hypolimnion began to rise before anoxia. Fall in Ca-Mg hardness and delayed rise in Si values in the summer epilimnion were caused by precipitation of marl and uptake of Si in the littoral zone. Surficial sediments were laminated and the laminae were approximately annual. Analysis of diatom communities in the sediment revealed rapid increase in productivity over the past quarter century associated with development of the watershed.

THE ECONOMIC EFFECTS OF PAWTUCKAWAY STATE PARK: V. EFFECT OF PARK USE ON ENVIRONMENTAL QUALITY,
New Hampshire Univ., Durham. Water Resources Research Center.
C. T. K. Ching, and G. E. Frick.
Available from the National Technical Information Service as PB-221 022, $3.00 in paper copy, $0.95 in microfiche. New Hampshire Water Resources Research Center, Durham, Research Report No 8, December 1972. 53 p, 10 fig, 18 tab, 11 ref. OWRR A-026-NH (1). 14-31-0001-3229.

Descriptors: *Environmental effects, *Water quality standards, *Parks, Recreational facilities, Coliforms, Water analysis, Property values, Water utilization, *New Hampshire, Sampling, Regression analysis.
Identifiers: *Pawtuckaway State Park (N.H.), *Nottingham, Analysis of variance.

The purpose was to determine the effect of Pawtuckaway State Park on the quality of the immediate environment. During the summer of 1971, an intensive study was made of (1) lake water quality as affected by park usage, and (2) the attitudes of private water-oriented landowners toward the park. First, physical measurements of water quality were made and twelve water quality indices were determined by a sampling process. Measurements indicated that the levels of eleven water quality indices were within acceptable bounds for recreational use. Coliform count, the twelfth indicator, occasionally exceeded State limits, but the mean value of the beach area was below the State limit. Neither climate, attendance, weekend use (as high as 8,000 people), nor time were significant determinants of the coliform level. Second, a survey of shoreline residents was conducted to determine their attitudes about the impact of the park on the environmental quality of the surrounding area. This survey indicated that the majority of the 90 landowners interviewed held favorable attitudes toward the park, including an opinion that the park improved their property values. Both the water quality analysis and the attitudinal survey indicated that the establishment of Pawtuckaway State Park has not had an adverse effect on the quality of the environment.

POLLUTION OF THE MARINE ENVIRONMENT AND THE EFFECTS THEREFROM: THE CASE FOR STRICTER ENFORCEMENT,
York Univ., Downsview (Ontario). Faculty of Environmental Studies.
L. M. Edelstein, and M. S. Wei.
In: Oceans Ontario. Technical Sessions. April 22, 1972. James Allister Mac Innes Foundation, Toronto, Ontario, Canada, p 53-81, (1972). 18 ref.

Descriptors: *Canada, *Coasts, *Water pollution control, *Oil, Chemicals, Radioactive wastes, *Water pollution effects, Toxicity, Aquatic life, Food chain, Biological oxygen demand, Balance of nature, Oil spills, Cleaning, Burning, Chemicals, Dispersion, Skimming, *Legislation.

The difficulties faced by Canada, having the longest coastline in the world are unique and she is forced to come to terms with the many pollution problems of her seas and coasts. The effects of crude oils, noxious chemicals, and radioactive wastes on the ocean environment are discussed, including toxicity to marine life, assimilation into the food chain, high BOD, and upset of the ecological balance. The immediate and long-term effects of oil spills are stressed; cleanup techniques such as burning, skimming, sinking, and chemical dispersal are described. Canada's position as a coastal state rather than a shipping state limits her effectiveness internationally. Canadian legislation concerning pollution control is discussed. (Ensign-PAI)

AN ECOLOGICAL STUDY OF THREE FRESH WATER PONDS OF HYDERABAD-INDIA: II. THE ENVIRONMENT,
Osmania Univ., Hyderabad (India). Hydrobiology Lab.
V. S. Rao.
Hydrobiologia. Vol 39, No 3, p 351-372, 1972.
Identifiers: *Bacteria, Ecological studies, Environment, *India (Hyderabad), *Phytoplankton, Ponds, Water pollution effects.

The fluctuation of pH, Ca and bicarbonate contents of water were influenced by dissolved CO2. Invariably the concentration of Ca and bicarbonate were complementary to each other, but on certain occasions Na and Fe also behaved like Ca towards bicarbonate. The accumulation of soluble organic matter in water depended largely on the density of phytoplankton population and also on Mg and the Ca/Mg ratio. The concentration of nitrate increased in these waters either after the early rains or towards the end of monsoon season. Possibly it depended on the nature of the catchment area and on the intensity of bacterial activity. The salinity and total solid contents of water varied together. Waters sustained more total solids when the pH was around 7.8. The % sodium and % Cl + NO3 fluctuated directly with salinity and apparently indicated pollution of animal origin. Na and chlorides showed a direct relationship. (See also W72-01363)--Copyright 1972, Biological Abstracts, Inc.

THE PHYTOPLANKTON OF LAKE OVRE HEIMDALSVATN, CENTRAL SOUTH NORWAY, 1969-70,
Norwegian Inst. for Water Research, Oslo.
Pal. Brettum.
Identifiers: Blooms, Chlorophyceae, Chrysophyceae, Cryptophyceae, Lakes, Mountain lakes, *Norway, *Phytoplankton, Spring, *Lake Ovre Heimdalsvatn.

The quantitative and qualitative composition of phytoplankton in Lake Ovre Heimdalsvatn, a high mountain lake in Jotumheimen, was studied from July 1969 to Sept. 1970, with 18 vertical sampling series at 2 stations. Species within the classes Chrysophyceae, Chlorophyceae and Cryptophyceae predominated. The algal composition and total phytoplankton volume were very similar at the 2 stations throughout the year. The highest values of total volume, about 600 x 1,000,000 micro 3/1, occurred during the spring bloom.--Copyright 1973, Biological Abstracts, Inc.

THE ROLE OF FLOOD FLOWS IN NUTRIENT SUPPLY AND REMOVAL AS A FACTOR IN THE EUTROPHICATION OF THE CONNECTICUT RIVER,
New Hampshire Univ., Durham.
C. Barksdale.
In: Formation of Public Policy on Issue of Out-of-State Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area, Massachusetts Water Resources Research Center, Publication No. 25, 1973. Appendix D, 19 p, 5 tab, 44 ref. OWRR C-2169 (No. 3377) (1).

Descriptors: *Flood flow, *Nutrients, *Eutrophication, Low flow, Urban runoff, Environmental effects, Pollution, *Connecticut River, *Diversion, *Inter-basin transfers.
Identifiers: Long Island Sound.

A survey of available literature to determine the role of flood flows in nutrient supply and removal in the Connecticut River Basin and their effect on the eutrophication of the river and the Long Island Sound is presented. The literature and data from

the U.S. Public Health Department permit the construction of discharge versus nutrient concentration graphs at two points on the Connecticut River, but do not enable definitive conclusions to be made with regard to eutrophication. The basic findings of the survey are that (1) flood flows increase the nutrient loads in the Connecticut River as they tend to flush out nutrients trapped during low flows; (2) urban and suburban areas are the greatest source of nutrients in the Connecticut River Basin; (3) impoundments along the river have a significant effect on the release of nutrients as the dams tend to trap materials having a deleterious effect on the Connecticut River water especially during low flow periods; and (4) further study is necessary to assess the degree of eutrophication of the River and Long Island Sound caused by flood flows. (See also W73-10726). (Elfers - North Carolina).

A COMPARISON OF MICROARTHROPOD POPULATIONS IN SEWAGE-EXPOSED AND SEWAGE-FREE SPARTINA SALT MARSHES,
North Carolina Univ., Chapel Hill. Dept. of Zoology.
E. A. McMahan, R. L. Knight, and A. R. Camp.
Environ Entomol. Vol 1, No 2, p 244-252. 1972. Illus.
Identifiers: Amphipods, *Arthropods, Marshes, Populations, *Salt marshes, *Sewage effluents, *Spartina, Spiders.

An investigation of effects of sewage effluents on populations of microarthropods living in Spartina marshes was carried out in the spring and summer of 1970, using primarily a vacuum collecting technique. Comparisons of dominant forms, population densities, and species diversities were made between populations inhabiting marsh grass exposed to fooding by treated sewage wastes and those in nonpolluted areas. Only in the case of spiders and amphipods were significant differences found, with density in both cases being greater in the polluted marsh. Species diversity was relatively high, especially for populations from Spartina growing within margins of artificial ponds, some of which were also exposed to treated sewage wastes.--Copyright 1973, Biological Abstracts, Inc.

GROWTH AND METABOLISM OF OSTREA EDULIS LARVAE,
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. A. Gabbott, and D. L. Holland.
Nature, Vol 241, No 5390, p 475-476, February 16, 1973. 3 tab, 9 ref.

Descriptors: *Larvae, *Metabolism, *Energy budget, *Growth rates, Oysters, Efficiencies, Proteins, Carbohydrates, Lipids, Biochemistry, Mollusks, Invertebrates, Marine animals, Animal growth, Chemical analysis.
Identifiers: *Ostrea edulis, Chemical composition, Isochrysis galbana, Tetraselmis suecica.

An energy budget has been calculated for Ostrea edulis larvae in terms of growth and metabolism from data on the changes in biochemical composition of the larvae during development and on the losses of body components during short-term starvation experiments. Three batches of larvae reared at the MAFF Fisheries Experiment Station were kept at 20-22 degrees C in aerated seawater, and fed a mixed algal diet of Isochrysis galbana and Tetraselmis suecica. On release day zero and days 4,8, and 12, samples of approximately 10-15,000 larvae were collected, counted, and analyzed for protein, lipid, and carbohydrate content. Further samples of larvae were taken from the main culture vessels and placed without food in aerated seawater for 48 h before biochemical analysis. On release (days 0-2) the daily loss of body reserves was equivalent to an oxygen consumption rate of 0.0006 microliter 02 per larva per hr. The daily loss of reserves for days 4-6 and 8-10 was equivalent to oxygen consumption rates of 0.0025 and 0.005 microliter 02 per larva per hr respectively. The net growth efficiencies K2 for swimming larvae fell from 78.6 percent on release to 55.5 percent on day 10. The daily food requirements (assimilated ration) to support growth and metabolism represented 64.9 percent and 42.3 percent of the body weight on day 0 and day 10 respectively. (Holoman-Battelle)

GEOGRAPHIC DIFFERENCES IN PHYTOPLANKTON SENSITIVITY TO PCBS,
Woods Hole Oceanographic Institution, Mass. Dept. of Biology.
N. S. Fisher, L. B. Graham, E. J. Carpenter, and C. F. Wurster.
Nature, Vol 241, No 5391, p 548-549, February 23, 1973. 1 fig, 1 tab, 14 ref.

Descriptors: *Polychlorinated biphenyls, *Diatoms, *Toxicity, *Water pollution effects, Phytoplankton, Estuarine environment, Aquatic habitats, Chrysophyta, Marine algae, Continental shelf, Cultures, Plant growth.
Identifiers: *Fragilaria pinnata, *Thalassiosira pseudonana, *Bellerochia, *Clones, Marine environment, Sensitivity, Sargasso Sea, Data interpretation, Oyster Pond, Great South Bay, Moriches Bay, Sample preservation.

An investigation has been made of the toxicity of PCBs to three species of diatoms, comparing clones isolated from the relatively stable Sargasso Sea waters with those from fluctuating estuarine environments. Cells of Thalassiosira pseudonana, Fragilaria pinnata and Bellerochia sp were grown axenically in f/2 medium. Exponentially growing cells were inoculated onto a sterile medium to which 10 ppb PCBs (Aroclor 1254) was added. The cultures were maintained at 20 degrees C and illuminated 14 h/day; one-ml samples were fixed with Lugol's solution and counted with a Speirs-Levy eosinophil counter. Although growth of all seven clones tested diminished with PCB treatment, isolates from the Sargasso Sea invariably were more sensitive than were clones from estuaries and the continental shelf. Both Bellerochia clones were more sensitive than all others tested. Two-way analyses of variance on the logarithmically transformed data showed that, at 95 h, the interaction term between PCB treatment and geographic origin was significant for T. pseudonana, and for Bellerochia sp., indicating algal sensitivity was highly dependent on the sites of isolation. SLIME-INHABITING GEOFUNGI IN A POLLUTED STREAM (WINTER/SPRING),
Washington Univ., St. Louis, Mo. Dept. of Biology.
J. Noell.
Mycologia, Vol 65, No 1, p 57-66, January-February 1973. 1 fig, 4 tab, 13 ref.

Descriptors: *Water pollution, *Isolation, *Sewage effluents, Aquatic fungi, Missouri, Water sampling, Yeasts, Aquatic environment, Organic loading, Spatial distribution, Temporal distribution.
Identifiers: *Geofungi, Hyphomycetes, Sugar Creek, Culture media, Selective media, Agars, Phycomycetes, Fusarium, Phoma, Cladosporium, Verticillium, Epicoccum, Gliocladium, Alternaria, Acremonium, Aspergillus, Pestalotia, Curvularia, Geotrichum, Rhinocladiella, Diplodia, Cylindrocladium, Sporothrix, Paecilomyces, Ceratocystis capillifera, Ceratocystis moreau, Coprinus, Penicillium, Trichoderma.

Samples were taken biweekly for 4 months (winter to spring) from sites above and below the sewage effluent outfall in Sugar Creek (Missouri). Slime was removed with sterile implements from rocks in and 25 cm from the bank of the channel. After suspension in sterile water, small pieces were plated onto isolation medium. Colonies arising on the isolation medium were transferred to corn meal agar for identification. Species of Penicillium and allied genera were transferred to Czapek's solution agar for identification. Excluding Geotrichum and yeasts (ca. 400 ioslates), some 20 genera accounted for approximately 700 isolates. Numbers vary from 220 for Penicillium species to only eight for Curvularia. Species of several interesting genera were isolated only once or twice. These included Rhinocladiella, Diplodia, Cylindrocladium, Sporothrix, Paecilomyces, and two non-Hyphomycetes, Ceratocystis capillifera, C. moreau and a Coprinus sp. In addition, a few sterile forms and a variety of Phycomycetes were isolated. Of 689 isolates, 290, representing 42 percent of the total, were recovered from the channel; 399, or 58 percent, were recovered near the bank. Distribution of isolates by site and collection date shows temporal and spatical variation between genera. Distinct differences in number and type of isolates between channel and edge sites, and above and below the effluent outfall are noted. Problems of studying geofungi in aquatic systems and the significance of their presence are discussed. (Holoman-Battelle)

BIOLOGY OF SEA MUSSELS (MYTILUS CALIFORNIANUS (CONRAD) AND M. EDULIS (LINN.)) BEFORE AND AFTER THE SANTA BARBARA OIL SPILL (1969),
British Columbia Univ., Vancouver. Dept. of Zoology.
J. R. E. Harger, and D. Straughan.

LIBRARY OF L. URBANA-CHAMPAIGN

Water, Air, and Soil Pollution, Vol 1, No 4, p 381-388, September 1972. 7 tab, 13 ref.

Descriptors: *Oil spills, *Water pollution effects, *Mussels, Oil pollution, Biomass, Clams, Mollusks, Invertebrates, Shellfish.
Identifiers: *Mytilus californianus, *Mytilus edulis, *Santa Barbara oil spill, Macroinvertebrates, Data interpretation, Carpenteria Reef, Santa Barbara Harbor, Ellwood Pier, Goleta Point.

Effects of the 1969 Santa Barbara Oil Spill on sea mussels were investigated by comparing biomass characteristics of mussel populations in polluted and clean areas before, during, and after the discharge. In accordance with directions outlined by Connell (1971) the following null hypotheses were tested: (a) Mussels collected in August 1969 from areas experiencing oil pollution were not lighter in body weight than those collected from the same locations in previous years. (b) Mussels collected from areas experiencing oil pollution in August 1969 were not lighter in body weight than those collected in subsequent years from the same locations. Animals in exposed areas were not significantly lighter in body weight than those in clean areas. Likewise no deleterious effect in the form of lowered body weights could be detected in mussels from polluted areas in three successive years subsequent to the oil spill. Mussels were not sampled until 7 mo after the initial spill so that any immediate deleterious effect generated by the oil could have been compensated for by the time of examination. It is noted that the spill in question occurred at a time of minimal growth on the part of the sea mussels involved and that an adverse response might have resulted if the oil had washed ashore during a period of heightened growth. EFFECTS OF KRAFT MILL EFFLUENT ON A MARINE BENTHIC COMMUNITY,
Bedford Inst., Dartmouth (Nova Scotia).
D. L. Peer.
Water, Air, and Soil Pollution, Vol 1, No 4, p 359-364, September 1972. 1 fig, 1 tab, 9 ref.

Descriptors: *Pulp wastes, *Water pollution effects, *Benthic fauna, *Biological communities, Bottom sampling, Sediments, Nematodes, Crustaceans, Annelids, Suspended solids, Marine animals, Speciation, Amphipoda, Isopods, Invertebrates, Flocculation, Effluents, *Canada.
Identifiers: *Marine environment, Data interpretation, Polychaetes, Nemerteans, Van Veen grab, Sample preservation, Cumacea, Scuds, Arthropods, Nephtys, Leanira, Glycera, Tellina agillis, Echinarachnius parma, Lumbrineris fragilis, Scoloplos armiger, Laonice cirrata, Phyllodoce mucosa, Pholoe minuta, Tharyx acutus, Sternaspis fosser, Pectinaria hyperborea.

A quantitative survey of a marine benthic community was taken just prior to the discharge nearby of a bleached kraft paper mill and the area was surveyed again 2 yr later. Ten quantitative benthos samples were taken at each of three sites using a 0.1-m Van Veen bottom grab. The contents were sieved through an 0.8-mm mesh and the residue was preserved in a solution of 10 percent formalin and seawater. The animals were hand sorted from the sediment residue, separated into taxonomic groups, counted, blotted, and weighed. It was concluded that: there has been a change in the composition of the benthic community since 1967; some of these changes may be accounted for by the reduction in tidal currents and resulting changes in sediment particle size composition; and the main cause of the changes is the flocculation of material from the mill effluent. It is not known whether the animals are responding to the physical effect of the flocculated material or to toxic compounds contained by it. (Holoman-Battelle)

TOWARDS PRODUCTION BIOLOGY IN RUNNING WATER ECOSYSTEMS,
Freiburg Univ. (West Germany). Limnologisches Institut.
J. Schwoerbel.
Verh Dtsch Zool Ges. 65, p 57-65, 1971. Illus. English summary.
Identifiers: Algae, Bacteria, Biology, Ecosystems, *Food chains, *Odagmia-Ornata, Pollution, Water pollution effects, *Nutrients, Productivity.

Running waters are open steady state systems. The quantity of produced matter depends on the nutrients in the flowing water and the consumption of the primary produced or allochthonous matter by the secondary producers. The nutrient exchange between sediment and water regulate the nutrition level in the downstream flowing water. The larvae of Simuliidae, for instance, shows that most of the drifting organic matter, detritus, algae, and bacteria, in the flowing water is well filtered but not used by the filtering consumers. The feeding rate of the larva of Odagmia ornata is 6.5 microgram dry weight yeast/animal. Nevertheless, bacteria are the most important basis for food chains in polluted running waters.–Copyright 1973, Biological Abstracts, Inc.

EFFECT OF SEAWATER SOLUBLE FRACTION OF KEROSENE ON CHEMOTAXIS IN A MARINE SNAIL, NASSARIUS OBSOLETUS,
Woods Hole Oceanographic Institution, Mass.
S. M. Jacobson, and D. B. Boylan.
Nature, Vol 241, No 5386, p 213-215, January 19, 1973. 2 tab, 9 ref.

Descriptors: *Bioassay, *Snails, *Water pollution effects, *Oil pollution, *Animal physiology, Laboratory equipment, Invertebrates, Oil spills, Sea water, Marine animals.
Identifiers: *Kerosene, Nassarius obsoletus, Benzene, Naphthalene, Macroinvertebrates, Crude oil, Chemotaxis.

Two experiments were condutced to determine the effect of soluble fractions of kerosene in seawater on the food-finding ability of the marine prosobranch snail, Nassarius obsoletus. Experiments were conducted in Y-shaped plastic chambers constructed so that flowing seawater entered at the two arms. One arm was randomly chosen to receive the stimulus, oyster extract in one experiment and scallop extract in the other. Snails were starved for 10 days prior to the test, and their movement was recorded in chambers containing seawater alone, attractant, kerosene extract, or attractant plus kerosene extract. Concentrations of oyster and scallop extracts were 0.33 ppm and 3 ppm, respectively. Kerosene extracts were prepared either by mixing with seawater and separating the aqueous and oil layers or by extracting four times with pentane. Concentrations used in the experiments were 1 and 4 ppm. The results show that minute quantities of seawater-soluble fractions of kerosene interfere with the chemically mediated attraction to food extracts in Nassarius obsoletus. Oil components may disrupt chemically mediated behavior of other organisms. Further study in this area is recommended. (Little-Battelle)

The Southern California Coastal Water Research Project (SCCWRP) is attempting to attain a substantial understanding of the ecology of the coastal waters of Southern California. The goals and objectives of the project are to: (a) determine the input rates and distribution of the substantial and trace-level organic and inorganic materials entering the coastal waters; (b) investigate the natural phenomena of the Southern California Bight in present and recent times; (c) determine the effects of man on the coastal waters and distinguish them from natural phenomena; (d) develop indices of environmental health; (e) develop the capacity to predict man-induced effects on the coastal waters; and (f) determine the methods by which the coastal water environment may be enhanced. The findings should be useful in efforts to limit harmful effects and to promote enchancement of the coastal environment. The major effort thus far has been an information search in 17 task areas of physical and chemical oceanography, marine biology, and environmental engineering. In addition, several new research projects have been started under SCCWRP direction. Discussed are some of the technical problems associated with such an effort such as quantifying the natural fluctuations of physical, chemical, and biological parameters; establishing environmental criteria; and correlating observed effects with pollutant distributions. REDUCTION OF MERCURY WITH CYSTEINE IN COMMINUTED HALIBUT AND HAKE FISH PROTEIN CONCENTRATE,
National Marine Fisheries Service, Seattle, Wash. Pacific Fishery Products Technology Center.
J. Spinelli, M. A. Steinberg, R. Miller, A. Hall, and L. Lehman.
Journal of Agricultural and Food Chemistry, Vol 21, No 2, p 264-268, March/April 1973. 5 fig, 6 tab, 17 ref.

Descriptors: *Separation techniques, *Mercury, *Fish, Hydrogen ion concentration.
Identifiers: *Biological samples, *Cysteine, Removal, Sample preparation.

A study was made to determine the effectiveness of cysteine in reducing the mercury content of comminuted fish and fish protein concentrate (FPC). Comminuted fish tissue was extracted with 0.1 M NaCl containing cysteine HCl.H2O in concentrations ranging from 0 to 0.5 percent. The amount of Hg that could be extracted from the fish was related to the concentrations of cysteine and the pH of the tissue, but the relation was not linear. The most efficient use of cysteine in reducing the Hg content of comminuted fish was obtained when the cysteine-containing extraction solution was percolated through the fish contained in the column. When cysteine was used in an aque-

ous system, only minimal cysteine (4-8 percent) residues were left in the product, indicating that cysteine does not bind irreversibly with the fish proteins. (Little-Battelle)

THE EUTROPHICATION IMPLICATIONS OF INTERACTIONS BETWEEN NATURALLY OCCURRING PARTICULATES AND METHANE OXIDIZING BACTERIA,
Ohio State Univ., Columbus. Dept. of Microbiology.
T. L. Weaver, and P. R. Dugan.
Water Research, Vol 6, No 7, p 817-828, 1972. 10 fig, 1 tab, 8 ref. OWRR A-027-OHIO (1).

Descriptors: *Methane, *Eutrophication, *Kaolinite, *Oxidation, *Clay minerals, Carbon, Algae, Land management, Bacteria, Carbon dioxide, Inorganic compounds, Diatoms, Suspended solids, Cycling nutrients, Particle size, Organic compounds, Nutrient removal.
Identifiers: Methane carbon, Particulate matter, Methane oxidation.

One of the main factors affecting methane carbon recycling and thereby eutrophication is the variety and quantity of suspended particulate material in the water column. Oxidation of methane by bacteria is markedly affected by organic and inorganic particulate materials which largely determine how much methane will be oxidized and retained in the aquatic ecosystem. Methane oxidation, in turn, greatly influences carbon accumulation which will at least partially govern the rate of eutrophication. The effects of various types of clays on methane oxidation are compared. It can be postulated that the type of non-clay insoluble inorganic particulates existing in a body of water can have an important effect on methane carbon retention. In studying effects of constantly illuminated algae upon methane oxidation, varying degrees of inhibition were observed with Anacystis nidulans, Chlorella vulgaris, and Anabaena variabilis whereas Schizothrix calciocola had no effect on methane uptake. It was also evident from control experiments that algal cells alone do not take up detectable quantities of methane. Suggestions are given for several 'particulate management' practices to partially control eutrophication. Another speculation would be seeding lakes with algae known to inhibit methane oxidation. (Jones-Wisconsin)

COMPETITION BETWEEN AN ALGA AND AN AQUATIC BACTERIUM FOR PHOSPHATE,
Cornell Univ., Ithaca, N.Y.
G-Y. Rhee.
Limnology and Oceanography, Vol 17, No 4, p 505-514, 1972. 5 fig, 4 tab, 34 ref. OWRR B-024-NY (1).

Descriptors: *Competition, *Algae, *Aquatic bacteria, *Phosphates, *Scendesumus, *Pseudomonas, Phytoplankton, Growth rates, Limiting factors.

Whether phytoplankton are capable of competing with aquatic bacteria for phosphates in vitro, the mechanism of such action, and the physiological basis of their competitive ability were determined. Scenedesmus and Pseudomonas were grown in pure and mixed cultures. Growth of each in the mixed culture was compared to that in pure cultures and phosphate removal from the media was followed at the same time. Specific growth rates of algae and bacteria in various phosphate concentrations and their increase in volume and number were measured. Algal growth was severely limited in the presence of bacteria, but bacterial growth was hardly affected by algae. First sign of competition in mixed cultures (cessation of exponential algal growth) was always observed some time after the external phosphate had been exhausted. The faster growth rate of bacteria accounted for the suppressed growth of the algae in mixed cultures. The first sign of competition in algae appeared when the concentration of surplus phosphorus within the algal cell dropped to a critical value near zero. The surplus phosphorus appeared to consist of three or all four inorganic polyphosphate fractions. (Jones-Wisconsin)

PRODUCTIVITY PROBLEMS OF FRESHWATERS.
Polish Academy of Sciences, Warsaw. Inst. of Ecology.

Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimerz Dolny, Poland. PWN Polish Scientific Publishers, Warsaw, 918 p, 1972. 58 fig, 56 tab, 1127 ref.

Descriptors: *Productivity, *Eutrophication, *Food chains, Primary productivity, Secondary productivity, Ecology, Fish management, Fertilization, Trophic level, Organic matter, Water pollution, Self-purification, Biodegradation, Energy budget, Mathematical studies, Statistical models, Simulation analysis, Ecosystems.
Identifiers: International Biological Program, UNESCO.

Participants in this symposium included 94 scientists from 27 countries of Europe, America, Asia, Africa, and Australia, in addition to a large number of Polish hydrobiologists, who presented production studies as undertaken in their countries within the framework of the IBP. Of special significance was the appraisal of particular problems by working groups arranged as follows: Primary production and efficiencey of its utilization, Secondary production and efficiency of its utilization including fish production, Organic matter transformation and microbiological processes in biological budgets of waters, Production studies as an aid in dealing with manmade changes in waters (eutrophication, pollution, selfpurification), Bioenergetics of aquatic organisms as a background for understanding production process in natural waters, and general problems--Biological budgets of water bodies. The first step toward application of mathematical theories of systems and mathematical simulations of ecosystems has been taken, and contributions are included, although the gap was not completely closed between the description and understanding, between the empiracal assembly of facts and theoretical conclusions. The contents are divided into general categories, titled 'Production studies on the whole ecosystem or at least two trophic levels,' 'One level production studies and particular production problems,' and 'Regional studies and surveys.' (See W73-10896 thru W73-10933) (Auen-Wisconsin)

BIOLOGICAL PRODUCTIVITY OF LAKES KRIVOE AND KRUGLOE,
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Instut.
A. F. Alimov, V. V. Boullion, N. P. Finogenova, M. B. Ivanova, and N. K. Kuzmitskaya.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Fresh waters, May 6-12, 1970, Kazimerz Dolny, Poland, p 35-56, 1972. 3 fig, 14 tab, 9 ref.

Descriptors: *Productivity, *Primary productivity, *Energy budget, Phytoplankton, Benthic fauna, Zooplanton, Organic matter, Biomass, Biological communities, Cold regions, Animal metabolism, Energy conversion, Energy transfer, Photosynthesis, Benthos, Diatoms.
Identifiers: *Lake Krivoe (Karelia), *Lake Krugloe (Karelia), Energy values.

Studies were made of the biological productivity in Lakes Krivoe (oligotrophic) and Krugloe (bog lake) on the White Sea coast of Karelia, 30 km south of the Polar Circle. A negative balance of organic matter is typical of both lakes and both are poor in cutrients. They have low values of primary production which are represented mainly by phytoplankton with almost no higher water plants and a weak periphyton. The maximum plankton photosynthesis was observed in the surface water; photosynthesis rapidly decreases with depth, especially in the less transparent Lake Krugloe. Excess destruction over production indicates a great role of allochthonous organic matter in the biological budget. Of the 128 algal taxa (six types), the dominant species belong to cosmopolitan algae: Significant are the northern Alpian forms of Melosira and Dinobryon. Diatom species amount to almost 70%, largely rare forms. Zooplankton of both lakes include 23 Rotatoria, 9 Cladocera, 2 Copepoda. Benthic animals consist mainly of widely distributed holarctic and palaearctic species, some typical of cold water habitats. The profundal of Lake Krivoe is inhabited by glacial relicts. Benthos is characteristic of the somewhat impoverished fauna of northern Karelia. The main elements of the energy budget of these waters are tabulated. (See also W73-10895) (Auen-Wisconsin)
W73-10896

THE SEASONAL VARIATION OF SOME ECOLOGICAL EFFICIENCIES AND PRODUCTION RATES IN THE PLANKTON COMMUNITY OF SEVERAL POLISH LAKES OF DIFFERENT TROPHY,
Polish Academy of Sciences, Warsaw. Inst. of Ecology.
A. Hillbricht-Ilkowska, I. Spodniewska, T. Weglenska, and A. Karabin.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimerz Dolny, Poland, p 111-127, 1972. 5 fig, 1 tab, 29 ref.

Descriptors: *Productivity, *Seasonal, *Primary productivity, *Phytoplankton, *Zooplankton, *Trophic level, Predation, Photosynthesis, Nannoplankton, Plankton, Biomass, Crustaceans, Biological communities.
Identifiers: *Poland, Mikolajskie Lake (Poland), Taltowisko Lake (Poland), Sniardwy Lake (Poland), Flosek Lake (Poland).

Analysis was made of environmental and seasonal variation of primary production (Phytoplankton), production of filter-feeders (non-predatory zooplankton), and production of planktonic predators in lakes Mikolajskie (eutrophic, halomictic), Sniardwy (eutrophic, palimictic), Taltowisko (mesotrophic, halomictic) and Flosek (dystrophic) of Poland. Biomass of phyto- and nannoplankton was estimated; production and biomass of rotifers and crustaceans were calculated separately. To determine extent of consumer food supply utilization, two groups were distinguished having a different range of food selectivity--microconsumers and macroconsumers. Lakes of a lower trophic status showed greater phtosynthetic effeciency and nannoplankton share in production when compared with a typically eutrophic lake. Net production of filter feeders in eutrophic, mesotrophic and dystrophic lakes was similar and rather large, while it was strikingly small in the dystrophic lake

UNIVERSITY OF ILLINOIS URBANA CHAMPAIGN

constantly and strongly mixed. The data from a special experiment in situ and calculated interlevel efficiencies were used to analyze the extent of utilation of phytoplankton production, including that of nannoplankton, by filter feeders and the reduction of the latter by predators. The variation of the values of production rates, the mean daily P/B coefficient, was also analyzed for successive links in the production process. (See also W73-10895) (Jones-Wisconsin)

THE PRODUCTION PROCESSES IN SEVERAL POLISH LAKES,
Polish Academy of Sciences, Warsaw. Dept. of Hydrobiology; and Warsaw Univ. (Poland). Dept. of Hydrobiology.
A. Kajak, A. Hillbricht-Ilkowska, and E. Pieczynska.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimerz Dolny, Poland, p 129-147, 1972. 1 fig, 7 tab, 46 ref.

Descriptors: *Productivity, *Secondary productivity, *Primary productivity, Zooplankton, Benthic fauna, Littoral, Plankton, Tripton, Decomposing organic matter, Epilimnion, Hypolimnion, Bottom sediments, Organic matter, Biomass, Biological communities, Benthos, Biodegradation, Periphyton, Aquatic plants, Profundal zone, Photosynthesis, Phytoplankton.
Identifiers: Mikolajskie Lake (Poland), Taltowisko Lake (Poland), Sniardwy Lake (Poland), Flosek Lake (Poland), Warniak Lake (Poland), Pelagic zone.

Production processes of five Masurian, trophically different, lakes were examined by detailed analysis of production, biomass and trophic relations among particular groups of organisms and dominating species, by estimating organic matter, input and output, and by comparing primary production and tripton sedimentation. The pelagic zone is of greatest significance in organic matter production: in Mikolajskie Lake net primary production in the littoral zone forms 21%, and in the pelagic zone 79% of the total lake primary production. Zooplankton productivity greatly exceeds that of zoobenthos. About 30% of net primary production is sedimentated as tripton, most of which is decomposed in bottom deposits. Efficiency of benthos production relative to tripton is similar to efficiency of zooplankton relative to primary production. Total net primary production plus allochthonous organic matter is efficiently utilized in secondary production, including the roughly-estimated production of heterotrophic bacteria. Decomposition takes place mainly in the epilimnion. Significance of hypolimnion and of bottom deposits in decomposition processes is similar and not great. Decomposition is intensive in eulittoral, but, since the eulittoral is only a small part of the entire lake, its share in the total decomposition processes is not especially signigicant. THE MODELLING OF THE ECOSYSTEM OF LAKE DALNEE ON AN ELECTRONIC COMPUTER,
F. V. Krogius, E. M. Krokhin, and V. V. Menshutkin.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimerz Dolny, Poland, p 149-164, 1972. 9 fig, 1 tab, 50 ref.

Descriptors: *Productivity, *Model studies, *Ecosystems, *Input-Output analysis, Computers, Primary productivity, Fish, Seasonal, Energy transfer, Organic matter, Respiration, Predation, Dynamics, Biomass.
Identifiers: *Lake Dalnee (Kamchatka), Kamachatka (USSR).

The first experience in modelling the whole ecosystem of Lake Dalnee, Kamchatka, USSR, was carried out as a composition of finite automatons with description of the modelling algorithm in the language of logic algebra. On this first model was traced the whole path leading to the solution of the problem of optimum utilization of the natural resources of lakes. The objective of the investigation was not so much to solve, as to demonstrate the possibility of a quantitative solution of the problem of rational utilization of the biological, hydroenergetical and other resources of natural bodies of water. The basic indices of the annual biotic balance of the ecosystem of Lake Dalnee and the corresponding data obtained are presented. In proceeding from mere relative values: coefficients of exchange expenditures, natural mortality, maximum rations and some others (selected not always on a suffieiently theoretical basis, especially in respect to bacteria) as well as from the temperature and light regime of the lake, a plausible dynamic picture of the lake ecosystem was obtained. This offers a basis for the problem of potimum control of lake ecosystems, not very reliable, but fundamental. (See also W73-10895) (Jones-Wisconsin)
W73-10899

BIOLOGICAL PRODUCTIVITY AND BALANCE OF ORGANIC SUBSTANCE AND ENERGY IN LAKE BAIKAL,
B. K. Moskalenko, and K. K. Votinsev.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 207-226, 1972. 9 fig, 13 tab, 3 ref.

Descriptors: *Productivity, *Organic matter, *Energy budget, Biomass, Food chains, Solar radiation, Zooplankton, Fish, Respiration, Primary productivity, Bullheads.
Identifiers: *Lake Baikal (USSR), Pelagic zone, Comephorus, Seals, Coregonus autunalis.

Results of long-term complex investigations on biological productivity of the pelagic zone of oligotrophic Lake Baikal, USSR, are presented. Biomass volume, production regularities within the major groups of pelagic complex organisms, change in the numerical density and changeability of species in space and time, organism-environment relations and nutritional links between the organisms in different trophic levels were studied to arrive at conclusions for the prospects of increasing profitability of the fish economy. Average microalgal biomass and its seasonal fluctuations are given. The dominant organism of the Baikal zooplankton is the copepod, Epischura baicalensis; in deep water its biomass in summer is from 80 - 95% of the total zooplankton biomass. The fish population of the Baikal pelagial zone is chiefly composed of endemics: two species of pelagic bullheads and two Comephorus species. The ways of increasing the economically-profitable output are to increase growth of the Coregonus flock by intensifying natural reproduction and by artificial breeding. Also introduction of new species of fish should not interfere with the historically developed ichthiofauna complex. Estimations show that Lake Baikal can be converted into a large-scale industry of freshwater salmons and Coregonus. (See also W73-10895) (Jones-Wisconsin)

DISTRIBUTION PATTERN OF PHYTOPLANKTON AND BACTERIA, MICROBIAL DECOMPOSITION OF ORGANIC MATTER AND BACTERIAL PRODUCTION IN EUTROPHIC, STRATIFIED LAKE,
Max-Planck-Institut fuer Limnologie zu Ploen (West Germany).
J. Overbeck.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 227-237. 1972. 6 fig, 1 tab, 23 ref.

Descriptors: *Productivity, *Distribution patterns, *Phytoplankton, *Bacteria, *Microbial degradation, Eutrophication, Stratification, Organic matter, Metabolism, Food chains, Energy transfer, Plant physiology, Kinetics, Model studies, Biomass.
Identifiers: Plussee (Plon), Germany.

Studies on heterotrophic bacteria in eutrophic Plussee, Germany, are presented, especially the physiological mechanisms. The mean percent share of carbon dioxide-dark fixation in the bacterial biomass in the lake amounts to 6.6. Assuming the mean part of heterotrophic C-14 fixation in bacterial biomass as 6, the heterotrophic production can be calculated by measuring the heterotrophic carbon dioxide-fixation, although exact physiological studies are still to be performed. Autotrophic production occurs in the supper zone of the lake. These processes are important since the organic substance, liberated by autolysis of excretion of phytoplankton, is converted at once into particulate substance and is thus available to herbivore zooplankton. Data for an extensive computer analysis of distribution pattern of phytoplankton and bacteria were prepared. In the first half of summer, with remarkable autotrophic production in the epilimnion, a significant correlation of the biomass of bacteria to the phytoplankton was observed. After interruption of autotrophic production by phosphate depletion, the bacterial biomass dropped down to the hypolimnion and was correlated with phototrophic bacteria. Application of kinetic parameters for determination of microbial activities in water bodies offers a dynamic approach to aquatic microbiology and supplements computer calculations. THE PRODUCTION PROCESSES IN TWO HIGH-MOUNTAIN LAKES (VOR-DERER AND HINTERER FINSTERTALER SEE, KUHTAI, AUSTRIA),
Innsbruck Univ. (Austria). Inst. of Zoology.
G. Bretschko, P. Gollmann, H. Pfeifer, R. Pechlaner, and H. P. Weissenbach.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 239-269. 1972. 29 fig, 2 tab, 14 ref.

Descriptors: *Productivity, *Alpine, *Lakes, *Energy transfer, Phytoplankton, Nannoplankton, Bacteria, Rotifers, Copepods, Benthic fauna, Fish, Water chemistry, Primary productivity, Photosynthesis, Benthos, Periphyton.
Identifiers: Finstertaler See Kuhtai (Austria).

Vorderer and Hinterer Finstertaler See, lying above the timber line of the Central Alps at elevations of 2237 and 2256 meters were studied as type specimens of high-mountain lakes as models for more complex water bodies. Temperature, water chemistry, radiation, phytoplankton, bacteria, zooplankton, bottom flora, bottom fauna and fish were evaluated. Species composition of phytoplankton does not change essentially throughout the year, therefore differences in the activity coefficient are mainly due to alterations in environmental factors and physiological properties of the taxa concerned. Among the environmental factors light intensity and nutrient (phosphorus) limitations control phytoplankton production rates in the course of the year. Biomass of bacteria in both lakes is only slightly smaller than standing crops found in lowland lakes and is in the same order of magnitude as phytoplankton. Secchi disc transparencies have been plotted as there could be causal relations between turbidity and bacterial concentration. The zooplankton community is extremely simple: two rotifers and a single copepod form about 99% of the zooplankton. The terminal producers of both lakes are two salmonids, Salmo trutta f. fario and Salvelinus alpinus. (See also W73-10895) (Jones-Wisconsin)
W73-10902

PRODUCTION AND DECOMPOSITION IN THE EULITTORAL ZONE OF LAKES,
Warsaw Univ. (Poland). Dept. of Hydrobiology.
E. Pieczynska.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 271-285. 1972. 1 fig, 3 tab, 15 ref.

Descriptors: *Primary productivity, *Productivity, *Decomposing organic matter, *Energy transfer, *Littoral, Lakes, Organic matter, Water levels.
Identifiers: Masurian Lake District (Poland), Eulittoral zone.

The eulittoral is a transitional zone between lake and surrounding land, that area between maximal and minimal water level and neighboring areas, splashed or exposed by waves. This zone was studied in several lakes of the Masurian Lake District in Northern Poland. Its sources of organic matter are distinguished: productivity of the area, organic matter brought from the lake, and organic matter of terrestrial origin. Rate of decomposition of the several kinds of organic matter and the ways they participate in the energy flow are discussed. Two basic aspects of eulittoral energy flow can be distinguished. It is a zone characterized by intensive primary production and determines largely productivity of the water body. Main factors affecting the eulittoral are configuration of shore terrace, shore line development and water level fluctuations. Secondly, the eulittoral stores various kinds of matter of terrestrial and lake origin, frequently difficult to decompose (tree leaves, macrophytes), not used as direct food by consumers. This matter, after partial decomposition, when hydrological conditions change (changes in the water level), gets into the other lake zones in a reduced amount but in a form accessible for the consumers. (See also W73-10895) (Jones-Wisconsin)
W73-10903

THE CHAR LAKE PROJECT. A STUDY OF ENERGY FLOW IN A HIGH ARCTIC LAKE,
Toronto Univ. (Ontario). Dept. of Zoology.
F. H. Rigler.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 287-300. 1972. 5 fig, 3 tab, 17 ref.

Descriptors: *Productivity, *Energy budget, *Arctic, *Lakes, Geology, Climates, Water chemistry, Physical properties, Nutrient, Zooplankton, Algae, Benthos, Conductivity, Phytoplankton, Nannoplankton, Biological communities, Protozoans, Fish, Mosses, Crustaceans, Thermal properties, Limiting factors.
Identifiers: *Char Lake (Canada).

Biological simplicity of arctic lakes, ideal for studies to quantitate energy flow through a food chain, combined with their constant thermal regime, makes them excellent for testing hypotheses concerning the relation between biological diversity and stability. Char Lake, Cornwallis Island, Canada, was investigated and its geology, climate, morphometry, and simple chemical characteristics are described. In general, the communities are much less diverse than those in a comparable temperate lake. Net phytoplankton is sparse with nannoplanktonic flagellates and diatoms the dominant groups. Zooplanktoon is sparse; Limnocalanus macrurus and Keratella cochlearis are the only multicellular species and are present throughout the year. Ciliated protozoans are abundant but unidentified. The only fish is Salvelinus alpinus; the population is land locked. The benthic community is also simple; the only macrophytes are mosses. Eighteen species of invertebrates are known to occur in benthic communities and seven more thought to wash in from streams. Comparative studies of productivity and phosphate uptake kinetics between Char Lake and a fertilized lake suggest that productivity is nutrient limited, but that arctic lakes cannot respond as dramatically as temperate lakes to large nutrient inputs. LAKE GEORGE, UGANDA. STUDIES ON A TROPICAL FRESHWATER ECOSYSTEM.
Royal Society African Freshwater Biological Team, Lake Katwe (Uganda).

In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 301-309. 1972. 4 fig, 6 tab, 11 ref.

Descriptors: *Tropical regions, *Biological communities, *Energy conversion, *Productivity, Lakes, Physicochemical properties, Shallow water, Respiration, Cycling nutrients, Energy transfer, Biomass, Primary productivity, Secondary productivity.
Identifiers: *Lake George (Uganda).

The initial aims of the study were to describe the physical, chemical, and biological conditions in a tropical lake (exemplified by Lake George) and subsequently to investigate the major components of production of selected trophic levels. Preliminary work dealt with hydrology, water chemistry, primary productivity, nutrient flow through the lake, and the ecology of zooplankton, benthic diptera, and fish. Phytoplankton utilization of the bicarbonate ion as a direct carbon source results in a high daily rate of gross production. The equilibium concentrations of dissolved inorganic nitrogen and phosphorus are always low but rate of supply must be sufficient to maintain the low net productivity. An unusual contribution to this lake are the faeces of a large Hippopotamus which frequent the lake. Ratio of the post-primary biomass to that of the primary producers is very small, probably because of an inefficient energy link between the trophic levels due to the energy transfer occurring through the detrital cycle. Fish populations are divided into two groups: species growing to a large size and those of small adult size. One species only, Tilapia nilotica, a herbivore, makes up 80% of the considerable fish harvest. (See also W73-10895) (Jones-Wisconsin)
W73-10905

FUNCTIONS AND INTERACTIONS OF DISSOLVED ORGANIC MATTER AND THE LITTORAL ZONE IN LAKE METABOLISM AND EUTROPHICATION,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
R. G. Wetzel, and H. L. Allen.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 333-347. 1972. 4 fig, 2 tab, 51 ref.

Descriptors: *Productivity, *Organic matter, *Littoral, *Lakes, *Eutrophication, Aquatic plants, Energy budget, Marl, Decomposing organic matter, Cycling nutrients.
Identifiers: *Dissolved organic matter, Lawrence Lake (Michigan).

Recent findings from marl lakes indicate mechanisms involved in the functional roles of dissolved organic matter in relation to the producers of aquatic systems where the inorganic milieu severely suppresses facets of dissolved organic matter cycling and potential productivity. Changes in cycling and partitioning of dissolved organic matter are significant in lake eutrophication and ontogeny. In spite of large reservoirs of inorganic carbon in marl lakes, the highly buffered, alkaline conditions limit availability of carbon to algal and macrophytic photosynthesis. Critical to increased eutrophication is some mechanism of decreasing buffering capacity and carbonate reservoir. Morphometric changes accompanying gradual net increases in sedimentation rates also have significant effects. In closed basins of moderate to small size, marl lake succession can be altered relatively rapidly by the littoral flora, particularly Sphagnum. Supporting data from several lake types are discussed in evidence for interaction models of functional roles of dissolved organic matter in eutrophication ontogeny of lake production stability and maturation. The littoral complex functions as a source of dissolved organic matter that potentially can affect and regulate pelagial autotrophy. Moreover, the littoral zone functions as a chemical and metabolic trap or 'sieve' for allochthonous dissolved and particulate organic and inorganic matter. (See also W73-10895) (Jones-Wisconsin)

THE UNIQUENESS OF SALT LAKE ECOSYSTEMS,
Monash Univ., Clayton (Australia). Dept. of Zoology.
W. D. Williams.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 349-361, 1972. 1 tab, 66 ref.

Descriptors: *Productivity, *Saline lakes, *Ecosystems, *Limnology, Biological communities, Primary productivity, Secondary productivity, Laboratory tests, Energy transfer.
Identifiers: Trophic dynamics, Soap Lake (Wash), Lake Werswrap (Austrailia), Lake Rudolph (E. Africa), Alviso Salterns (Calif).

Attention is focused on the somewhat odd position that inland salt waters occupy in the limnological spectrum. Salt lakes are discrete, simplified, and sometimes very productive ecosystems which provide a spectrum of ecosystem stability and complexity. This paper reviews research on the unique features characterizing inland salt lakes and their biota. The small number of projects dealing with the trophic dynamic relationships of a total ecosystem testify that ecosystems are complex units. Salt lakes have greatly decreased species diversities vis-a-vis freshwater localities, and in the most saline lakes, extremely few species occur. They are, insofar as the dynamics of water (apart from evaporation) and energy flow are concerned, closed systems, perhaps more discrete than any other ecosystem of similar size. Most salt lakes are relatively shallow and this results in decreased habitat heterogeneity. The reduced species diversity and simplified trophic structure derived from the absence of fish and macrophytes and the presence of decreased habitat heterogeneity of salt lakes make them considerably less difficult to study. The major producers appear to be periphytic and planktonic algae. The large recorded values for benthic and zooplankton standing crops are further indication of high secondary production. UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

Krasnoe (USSR), Lake Naroch (Byelorussia), Lake Myastro (Byelorussia), Rybinsk Reservoir (USSR), Kiev Reservoir (USSR).

Water bodies of various types and different geographical locations were investigated: Lakes Krivoe and Krugloe near the Polar Circle, Lake Krasnoe near Leningrad, three Byelorussian lakes, Lake Drivyati, Rybinsk Reservoir on the Volga River, and the Kiev Reservoir on the Dnieper River. The basic parameters of the energy budget (biomass, production, food ration, respiration) of successive trophic links (producers, bacterioplankton, non-predatory and predatory zooplankton and zoobenthos, fish), the coefficients P/B, and some ecological efficiencies are presented and discussed. The trophic levels of energy utilization should be particularly considered. Quantitative studies of the energy flow should be continued and the applied methods will enable one to clarify both the common characters of the biological energy budget of aquatic ecosystems and its typical characters in water bodies of different types. Special attention should be given to the effect of animals of each trophic level on the composition and biological peculiarities of the preceding one. This facet of interrelationships in the ecosystem can be regarded as a flow of information running in the direction opposite to the energy flow and together with abiotic factors determining the specific composition and characters of organisms of the trophic level. W73-10908

BIOLOGICAL PRODUCTIVITY OF DIFFERENT TYPES OF LAKES,
Akademiya Nauk SSSR, Leningrad. Zoologicheskii Institut.
G. G. Winberg, V. A. Babitsky, S. I. Gavrilov, G. V. Gladky, and I. S. Zakharenkov.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 383-404. 1972. 9 fig, 9 tab, 18 ref.

Descriptors: *Productivity, *Lakes, *Trophic level, *Energy budget, Mesotrophy, Eutrophication, Phytoplankton, Aquatic plants, Bacteria, Zooplankton, Benthic fauna, Benthic flora, Fish, Isotherms, Biological communities, Temperature, Lake morphometry, Solar radiation, Biomass, Photosynthesis, Primary productivity, Chlorophyll, Detritus, Seston, Standing crops, Predation, Biochemical oxygen demand.
Identifiers: Lake Naroch (Byelorussia), Lake Batorin (Byelorussia), Lake Myastro (Byelorussia), Lake drivyati (Russia).

Productivity by phytoplankton, marcrophytes, bacterioplankton, zooplankton, zoobenthos and fish was investigated in mesotrophic Lake Naroch, highly productive eutrophic Lake Batorin, and intermediate type Lake Myastro, Byelorussia, resulting in an approximate biological energy balance for the three different types of lakes. In computing total primary production it was assumed that the P/B coefficient of macrophytes was equal to 1.25, and that the expenditure on respiration for all primary producers was 20% of the gross production. Since production of periphyton was not experimentally determined, it was estimated by taking into account the substrate area suitable for periphyton and lake water optical indices. It was concluded that production of periphyton was close to the production of macrophytes. In mesotrophic Lake Naroch, primary production of phytoplankton was approximately 31% of total primary production, while in Lakes Myastro 87% and in Batorin 96%. Total production by autotrophic organisms in all the lakes was similar. Energy assimilated by autotrophic organisms was 0.30, 0.35, and 0.36% of the total solar radiation. Energy assimilated by bacteria in the vegetative season in Lake Naroch constituted 40% of primary production, in Lakes Myastro and Batorin, 89 and 74%, respectively. TROPHIC STRUCTURE OF LAKE TATSU-NUMA, AN ACIDOTROPHIC LAKE IN JAPAN, WITH SPECIAL REFERENCE TO THE IMPORTANCE OF THE TERRESTRIAL COMMUNITY,
Yamagata Univ. (Japan). Dept. of Biology.
G. Yamamoto.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 405-419. 1972. 2 fig, 3 tab, 26 ref.

Descriptors: *Productivity, *Trophic level, *Acidic water, *Fish population, Benthic fauna, Sessile algae, Insects, Leaves, Fish food organisms, Fish diets, Minnows, Standing crops, Plankton, Benthos, Food chains, Zooplankton, Phytoplankton, Organic matter.
Identifiers: *Lake Tatsu-numa (Japan), Tribolodon, Moroco.

Several lakes in northeastern Japan, originating from volcanic activity, contain strong mineral acid (pH 1.4 to 5.50). Of these, Lake Tatsu-numa was studied to ascertain mechanisms by which a relatively large fish population is supported in a small area with poor production, and characteristics of biological production of mineral acidotrophic lakes. Only two species of fish, Tribolodon hakonensis hakonensis and Moroco steindachneri steindachneri, inhabit this lake and their production is supported by benthic animals, sessile algae, and terrestrial insects which fall into the water. The fry and juvenile fish depend upon Oedogonium sp., Chydorus sphaericus, and suspended organic particles of the littoral area. Most of the zooplankton are herbivorous and their food was identified as nannoplanktonic algae and organic particles, with the exception of two species of Macrocyclops, which were carnivorous, and a predator-prey relationship was ascertained between Macrocyclops and Chydorus. Production is relatively higher in the littoral area than offshore. The well-developed Phragmites-Salix vegetation, covering 70% of the shore, is the main source of the primary production. The biotic community is fairly simple, with three or four terminal consumers in both the littoral and offshore areas supported mainly by terrestrial organisms rather than organisms produced within the lake itself. (See also W73-10895) (Jones-Wisconsin)
W73-10910

PRODUCTIVITY OF AQUATIC ORGANISM COMMUNITIES OF DIFFERENT TROPHIC LEVELS IN KIEV RESERVOIR,
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
D. Z. Gak, V. V. Gurvich, I. L. Korelyakova, L. E. Kostikova, and N. A. Konstantinova.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 447-455. 1972. 1 tab, 8 ref.

Descriptors: *Productivity, *Biological communities, *Aquatic populations, *Energy budget, *Reservoirs, Eutrophication, Primary productivity, Organic matter, Respiration, Benthic flora, Bacteria, Benthos, Herbivores, Aquatic plants, Zooplankton, Vegetation, Phytoplankton, Benthic fauna, Fish, Algae.
Identifiers: *Kiev Reservoir (USSR).

The aquatic communities of three trophic levels in the Kiev Reservoir on the Dnieper River, USSR, were measured, including primary production of phytoplankton, benthic fauna, filamentous algae, and aquatic plants. The difference in input and loss of organic matter was negligible, however, organic matter rich in nitrogen and phosphorus predominated in the matter leaving the reservoir. The total respiratory energy loss of phytoplankton, bacterioplankton, and zooplankton approaches the value of total respiration. The food requirement of bacterioplankton, herbivorous zooplankton, and non-predatory meso- and macrobenthos, and macrofauna living on macrophytes is almost balanced by primary production. The production of bacterioplankton and of all non-predatory animals may be considered as production of the second trophic level. The production of predatory invertebrates and the residual production of the 2nd trophic level form the reserve of the energy resource utilized by fish, accumulated on the bottom in the form of organic detritus, and to be removed by waterfowl and emerging insects. The fish yield during 1967-1968 provided 0.8 kcal/sq m. If the food coefficient is 10, it is calculated that 8.1 kcal/sq m in the form of fish are utilized by man--less than 1% of the total energy supply of the reservoir. (See also W73-10895) (Auen-Wisconsin)

ENERGY FLOW IN AQUATIC ECOSYSTEMS IN INDIA,
Maharaja Sayajirao Univ. of Baroda (India). Dept. of Biochemistry, and Freshwater Biological Station, Madras (India).
S. V. Ganapati, and A. Sreenivasan.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 457-475. 1972. 7 tab, 57 ref.

Descriptors: *Energy budget, *Energy conversion, *Fish harvest, Primary productivity, Solar radiation, Limiting factors, Herbivores, Carp, Photosynthesis, Oxygen, Light intensity, Limnology, Temperature, Nutrients, Respiration, Benthos.
Identifiers: *India, Tilapia, Chanos.

An attempt has been made to describe a semi-empirical method of determining the energy availing relationships in production, respiration, and decomposition without the help of highly sophisticated instruments and methods and without resorting to highly complicated mathematical equations and numerous assumptions. Data from results of studies on primary production extending over several seasons of the years 1962 to 1968 and the annual fish production in five typical fish ponds and two man-made lakes have been used in this exploratory paper for a working model in the determination of seasonal variations in the rates of photosynthesis and the energy flow at two trophic levels. The energy fixed from incident solar radiation varied from 1.1 to 10.0% in the smaller, shallower bodies of water and from 0.21 to 0.98% in the two bigger man-made lakes. As these waters were stocked with young of the truly herbivorous species of Indian carps, Tilapia and Chanos, the secondary fish production was from 0.27 to 1.04% of the fixed carbohydrate energy in the smaller bodies and from 0.022 to 0.092% in the bigger man-made lakes. Comparisons are made with certain West German lakes. (See also W73-10895) (Jones-Wisconsin)

BIOLOGICAL PRODUCTIVITY OF KURAKHOV'S POWER STATION COOLING RESERVOIR,
Akademiya Nauk USSR, Kiev. Instytut Hidrobiologii.
M. L. Pidgaiko, V. G. Grin, L. A. Kititsina, L. G. Lenchina, and M. F. Polivannaya.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 477-491. 1972. 9 tab, 8 ref.

Descriptors: *Productivity, *Energy budget, *Powerplants, *Cooling water, *Reservoirs,

Heated water, Trophic level, Phytoplankton, Benthic flora, Aquatic plants, Bacteria, Zooplankton, Biomass, Benthic fauna, Primary productivity, Secondary productivity, Plankton, Benthos.
Identifiers: *Kurakhov Power Station (USSR).

A study was conducted of the cooling reservoir of the Kurakhov's Power (electric) Station (USSR) during 1965-1968. It is characterized by specific heat load in summer and by a temperature rise of 0.5-3C and satisfies the sanitary standards of the USSR. Species composition and dominating ecosystems are affected principally by geographical location of reservoir, type of water exchange, limnological index (ratio of area to mean depth) for slow flow and flowless reservoirs, and annual expenditure of water for flowing reservoirs. Due to the heated discharge, water temperature in the Kurakhov reservoir exceeds the natural by 5 to 6C in winter and 2 to 4C in summer. The study was carried out in three sections: with natural temperature regime, with weak heating, and with great heating. In comparison with the control section of the reservoir with natural temperature regime, chronic overheating of water of 3.2C (average for year) leads to an increase in early primary and to a decrease in secondary production. The minimum water overheating does not cause a change of trophic level, but provides it. (See also W73-10895) (Jones-Wisconsin)
W73-10913

BIOLOGICAL PRODUCTIVITY OF THE RYBINSK RESERVOIR,
Akademiya Nauk SSR, Moscow. Institut Biologii Vnutrennykh Vod.
Y. I. Sorokin.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 493-503. 1972. 4 fig, 1 tab, 19 ref.

Descriptors: *Productivity, *Reservoirs, *Energy budget, Aquatic life, Metabolism, Bacteria, Phytoplankton, Zooplankton, Benthic fauna, Fish, Crustaceans, Benthos, Food chains, Fish harvest, Biomass, Organic matter, Primary productivity.
Identifiers: *Rybinsk Reservoir (USSR).

The efficiency of biological productivity and energy flux in the Rybinsk Reservoir (USSR) at all trophic levels in given, including phytoplankton, average number of bacterioplankton, microzooplankton, crustacean zooplankton, benthos, and fish population. The average data for 4 years (1964-1968) are tabulated. The phytoplankton organic matter provides only 25% of food consumed by animals, and the 75% is provided by bacteria; Protozoa and Rotifera give about 70% of total zooplankton production. The benthic fauna uses about 20% of total primary food. Fish larvae form the prevailing part of total fish production and are the basic food source for predatory fish. It is evident that the causes of its relatively low productivity are factors peculiar to a big shallow reservoir of the forest zone. Increase of productivity of the basic area appears impossible. Its main purposes are transport, energy, and shortly, water supply. Only partial solutions are recommended: regulation of the fishery, improvement of conditions for fish reproduction, and construction of pond systems in the shore regions. (See also W73-10895) (Jones-Wisconsin)

ENERGY TRANSFORMATIONS THROUGH PRIMARY PRODUCTIVITY AND FISH PRODUCTION IN SOME TROPICAL FRESHWATER IMPOUNDMENTS AND PONDS,
Freshwater Biological Satation, Madras (India).
A. Sreenivasan.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 505-514. 1972. 3 tab, 40 ref.

Descriptors: *Energy conversion, *Energy budget, *Primary productivity, *Fish harvest, Tropical regions, Reservoirs, Ponds, Productivity, Photosynthesis, Temperature, Solar radiation, Light intensity, Physicochemical properties, Plankton.
Identifiers: India.

Tropical areas with high temperature and bright sunshine are ideally suited for conversion of radiant energy for fish production. In connecting fish production with biological dynamics of ecosystems, six reservoirs and seven ponds and lakes in India were studied because of availability of commercial fishery data. In Bhavanisagar Reservoir conversion to fish was lower due to underexploitation of fish. In Amaravathi Reservoir photosynthetic efficiency as well as fish conversion efficiency were highest among the five impoundments due to algal blooms and their effective utilization by planktonphage fishes. The shallow Odathurai tank ranked even below the deep Amaravathi Reservoir. High utilization of light energy by algae was observed in the three eutrophic ponds, but, as regards fish conversion, the photosynthetically more efficient Ayyankulam pond ranked only next to Fort Moat, Vellore; this may be due to better harvesting and better stocking. There was a glaring contrast among the three upland lakes where a high light conversion efficiency in Ooty Lake and a low efficiency in Kodai Lake reflected the trophic status of the two cold-water, mountain lakes. Yercaud Lake showed a fairly high conversion. (See also W73-10895) (Jones-Wisconsin)

BASE FOR A MODEL OF THE SLAPY RESERVOIR ECOSYSTEM,
Ceskoslovenska Akademie Ved, Prague. Hydrobiologicka Lab.
M. Straskraba.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 529-540. 1972. 7 fig, 1 tab, 10 ref.

Descriptors: *Systems analysis, *Reservoirs, *Basic data collections, *Methodology, *Productivity, Solar radiation, Ecosystems, Evaporation, Temperature, Dissolved oxygen, Mixing, Phytoplankton.
Identifiers: *Slapy Reservoir (Czechoslovakia), Energy flow diagram, Annual cycles.

Two basic approaches dominate the present limnological work: the direct observations of aquatic ecosystems under different climatic conditions and effects of man, and an experimental laboratory analysis of interactions of selected factors and biota. A third approach is represented by natural experiments, in which the complexity of the interrelations is retained, and reaction on changing one or more variables is studied, thereby conclusive results concerning the effect of the changed variables can be achieved under favorable conditions. The third group models, 'precise models,' closest to field limnologists' thinking, represent the obvious next step of evaluation with quantitative data. A mathematical expression of the empirical deterministic relations between variables proves useful for predicting water conditions. Studies of Slapy Reservoir thermics show it as a dynamic system sensitive to changing discharges and inflow temperatures. The method is applied to the whole ecosystem. It is evident that a distinction of the characteristic annual cycles and correlation of the extreme values is a useful tool for studying the character of the dominant interrelations. In combination with approximation of the curves by harmonic analysis, prediction of the annual course during different conditions is obtained. Character and explanation of relations found represents a basis for modeling the Slapy Reservoir ecosystem. (See also W73-10895) (Jones-Wisconsin)

RESULTS OF THE STUDY OF SOME LINKS OF THE FOOD CHAIN IN A CARP POND IN CZECHOSLOVAKIA,
Karlova Universita, Prague (Czechoslovakia). Dept. of Hydrobiology.
V. Korinek.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 541-553. 1972. 5 fig, 10 tab, 24 ref.

Descriptors: *Productivity, *Food chains, *Ponds, *Energy transfer, *Trophic level, Carp, Nitrogen, Seston, Density, Standing crops, Phytoplankton, Zooplankton, Fish harvest, Organic matter.
Identifiers: *Czechoslovakia.

Results are given of the production study carried out on the carp pond Smyslov (southern Bohemia, Czechoslovakia) during the years 1965 to 1967. The standing crop of the bottom fauna and the zooplankton as well as the amount of nutrients have been measured since 1955 in this pond. Basic characteristics of the water--phytoplankton, zooplankton, fish, and comparison of trophic levels--are discussed. Content of Kjeldahl nitrogen in water and seston was measured. Density, standing crop and gross production of phytoplankton and zooplankton were measured and related to fish yield. Testing the distribution of measured values of the gross phytoplankton production, the hypothesis of the log-normal distribution cannot be refuted and yearly geometrical means were calculated. The most important group of the zooplankton from the production aspect in the pond were Cladocera. The changes in their density are shown. The dominant species were Daphnia pulicaria and Daphnia hyalina. The net efficiency of the energy transfer from phytoplankton to Daphnia was in the range from 9 to 52% and that from phytoplankton to fish between 2 and 13%. The efficiency values are also discussed. (See also W73-10895) (Jones-Wisconsin)

SOME OBSERVATIONS ON PRIMARY AND FISH PRODUCTION IN EXPERIMENTAL FISH PONDS IN MALACCA, MALAYSIA,
Fish Culture Research Training Inst., Malacca (Malaysia).
G. A. Prowse.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 555-561. 1972. 4 tab, 3 ref.

Descriptors: *Productivity, *Primary productivity, *Energy conversion, *Ponds, Fish stocking, Fish harvest, Photosynthesis, Fertilization, Solar radiation.
Identifiers: *Malacca (Malaysia), Autoshading.

Five ponds used for experimental stocking were studied and primary production measurements conducted at four weekly intervals. The ponds were stocked mainly with Tilapia, and algal feeder, with fewer grass carp, Ctenopharyngodon idellus and Puntius gonionotus. For estimating the fish production, the ponds were completely fished and drained and the increment of weight taken as the measure of productivity. Calculations of photosynthetic efficiencies ranged from 7.04 to 3.98%. Calculations of energy conversion from primary to fish production gave efficiencies of 1.02 to 1.79%. High protein pelleted foods give a conversion efficiency of 6%. The conversion efficiencies of 1.02 to 1.79% may seem low, but even the best of protein pelleted foods only give a conversion efficiency of about 6% when calculated as energy. The depth-productivity profiles show clearly the effect of autoshading and the rapid productivity decrease in the highly eutrophic conditions. Clearly autoshading and the high respiration of the phytoplankton must set an upper limit to the potential fish productivity under eutrophic conditions, and this has been found to be so in practice. LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

INTENSIFICATION OF FISH PONDS PRODUCTION,
Instytut Rybactwa Srodladowego, Zabieniec (Poland). Dept. of Fish Culture.
P. Wolny, and E. Grygierek.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 563-571. 1972. 8 fig, 4 tab, 4 ref.

Descriptors: *Primary productivity, *Fish harvest, *Fish food organisms, *Productivity, Fertilization, Trophic level, Temperature, Phytoplankton, Zooplankton, Benthic fauna, Carp, Biomass, Photosynthesis.
Identifiers: Phytophagous fish.

Fish production depends on the total productivity, thus observations were made on variations in the qualitative occurrence of organisms from different trophic levels, under various environmental conditions (different fertilization, different stock density, carp monoculture, polyculture, and phytophagous fish). The investigations were conducted at the Department of Fish Culture, Zabieniec, Poland; ponds were stocked with fish larvae. A clear positive correlation between temperature and fish growth was found. Mineral fertilization, increase of stock density, and introduction of phytophagous fish are important factors in intensifying fish production; when these were applied great increases of primary as well as secondary production were observed. The coefficient of correlation between primary production and fish production was estimated to be 0.98. Good results were obtained with double stock density of common carp but the best were in ponds with polyculture of common carp and phytophagous fish. The percentage relation between zooplankton and phytoplankton was inverse; no correlation was observed between fish and zooplankton. Although fish production in ponds with phytophagous fish was greater, the ecological efficiency of production uptake by fish was no greater; introduction of these fish is profitable not for an increase of ecological efficiency but for the general increase of pond productivity. (See also W73-10895) (Auen-Wisconsin)
W73-10919

PRODUCTIVITY AND ENERGY FLOW AT ALL TROPHIC LEVELS IN THE RIVER THAMES, ENGLAND,
Beford Inst., Dartmouth (Nova Scotia). Marine Ecology Lab.
K. H. Mann, R. H. Britton, A. Kowalczewski, T. J. Lack, and C. P. Mathews.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 579-596. 1972. 3 fig, 5 tab, 29 ref.

Descriptors: *Productivity, *Energy conversion, *Trophic level, *Energy budget, Photosynthesis, Respiration, Fish populations, Crustaceans, Rotifers, Detritus, Insects, Decomposing organic matter, Physical properties, Algae, Phytoplankton, Oxygen, Aquatic plants, Leaves, Benthic fauna, Primary production, Fish food organisms, Fry, Plankton, Energy transfer.
Identifiers: *River Thames (England), River Kennet (England).

Physical measurements, algal populations, phytoplankton biomass, oxygen consumption, planktonic primary production, macrophyte production, production by benthic animals, fish populations, estimation of the partitioning of the energy uptake of roach and bleak, and decomposition are given for the Thames River. Productivity and energy flow have been studied at all trophic levels in the river, a lowland river engineered for navigation and carrying considerable quantities of treated sewage effluent. The most abundant fish were roach (Rutilus rutilus) and bleak (Alburnus alburnus). Figures given for net production represent total photosynthesis less the respiration of the plants and the respiration of the heterotrophs, particularly bacteria and represent a net gain of calories to the community during a 24-hour period. The figures from direct estimates of production by browsers and grazers below the Kennet River mouth are almost exactly those obtained by back-calculation from the food requirements of fish. The very high population densities and production rates of young fish have only recently been determined and greatly modify earlier estimates of total fish production. W73-10920

THE CHALK-STREAM ECOSYSTEM,
Freshwater Biological Association, Wareham (England). River Lab.
D. F. Westlake, H. Casey, H. Dawson, M. Ladle, and R. H. K. Mann.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 615-635, 1972. 5 fig, 4 tab, 40 ref.

Descriptors: *Productivity, *Streams, *Ecosystems, *Calcareous soils, *Primary production, Physicochemical properties, Energy budget, Biomass, Organic matter, Aquatic plants, Algae, Invertebrates, Fish populations, Detritus, Suspended load, Solar radiation, Leaves, Temperature, Predation, Respiration.
Identifiers: *Chalk-streams, Southern England, River Frome (England), Bere Stream (England), Self-shading.

The typical chalk-stream results from a particular combination of geology, plant and animal species and human management found in Southern England. Research on a range of chalk-streams, especially a stretch of the Bere Stream and the larger River Frome, details the physical and biotic factors affecting production. Accounts are given of the composition, biomass, and production of the communities of higher plants, algae, invertebrates and fish, and of the throughput and deposition of fine detritus. Available data on the biomass and production of the communities at Bere Heath are summarized. The most striking feature is the vast quantity of energy present in the form of detritus, which approaches the magnitude of the useful solar energy input and is probably more than an order of magnitude larger than the invertebrate food requirements. The main uncertainties in the estimates of primary production are algal production, the P/B ratio for emergent plants and the allowances made for the biomass in reaches not studied. Since most of the chemicals in solution show little seasonal variation, and appear to exceed the requirements of the communities, the major factors controlling production are physical and biotic. PHYTOPLANKTON PRODUCTION, CHEMICAL AND PHYSICAL CONDITIONS IN LOCH LEVEN,
Nature Conservancy, Edinburgh (Scotland); and Freshwater Fisheries Lab., Pitlochry (Scotland).
M. E. Bindloss, A. V. Holden, A. E. Bailey-Watts, and I. R. Smith.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 639-659, 1972. 6 fig, 5 tab, 19 ref.

Descriptors: *Phytoplankton, *Productivity, *Chemical properties, *Physical properties, Temperature, Circulation, Solar radiation, Energy budget, Nitrogen, Phosphorus, Algae, Photosynthesis, Primary production, Benthic flora, Diatoms, Plankton, Water balance, Energy balance, Chlorophyll, Nutrients, Silicates, Respiration.
Identifiers: *Loch Leven (Scotland), Self-shading.

Throughout the year Loch Leven (Scotland) shows large crops of planktonic algae which are considered the main contribution to the lake's primary production. Although macrophytes are sparse, considerable quantities of benthic algae, mainly diatoms, but including some blue-green and flagellate algae, develop as attached and motile communities in this shallow water. Studies on species composition, seasonal succession and spatial distribution of the benthic algae are being started. Loch temperature, water balance, loch circulation, radiation and energy balance are described. Chemical studies have concentrated on the input and loss of nitrogen and phosphorus through the loch. More than 200 planktonic algal species are recorded. Predominance of 'nano' algae and small cells of other species is an interesting general feature, associated with apparent absence of filter-feeding herbivorous crustaceans, although other algal-feeding plankters are often abundant. The complexity of the chlorophyll-a increase during the first half of the year is seen when the succession of constitutuent algal species is considered. The self-shading effect tends to stabilize euphotic populations below one square meter and to oppose somewhat expected increase in productivity with increasing standing crop. (See also W73-10895) (Jones-Wisconsin)
W73-10922

PRIMARY PRODUCTION OF A MONTANE RIVER,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
M. Bombowna.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 661-671, 1972. 8 fig, 7 tab, 8 ref.

Descriptors: *Testing procedure, *Primary productivity, *Mountains, *Rivers, Oxygen, Algae, Chlorophyll, Conductivity, Photosynthesis, Temperature, River flow, Diatoms, Solar radiation, Water level fluctuations, Energy conversion.
Identifiers: *Attached algae, *Montane river, River Raba (Poland).

The primary production of the Polish montane River Raba was measured using several techniques. Results of primary production measurements of attached algae and seston by the C-14 method at very low water levels are given. Measurements of oxygen fluctuations in 24-hour cycles were made at varying water levels and varying rapidity of water currents. Air and water temperature and electric conductivity were measured simultaneously. Primary production is in inverse ratio to water level and discharge volume. Succession of predominant microphytes in different seasons affects primary production although that dependence is often obliterated by water level fluctuations. The amount of primary production of attached algae depends considerably on growth of communities on stones and it fluctuates throughout the river, being higher in the upper section's stony bottoms than in the lower section's sandy bottom. Chlorophyll content is a good index of productivity of a river of this type. Primary production estimates in rapid currents cannot be made by measuring the oxygen content. The method of artificial substrata fixed periodically proved most useful for investigations on the fluctuations of primary production of attached algae. (See also W73-10895) (Jones-Wisconsin)
W73-10923

OBSERVATIONS ON PRIMARY PRODUCTION OF PHYTOPLANKTON IN TWO FISH PONDS,
Karlova Universita, Prague (Czechoslovakia). Dept. of Hydrobiology.
J. Fott.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 673-683, 1972. 7 fig, 2 tab, 14 ref.

Descriptors: *Ponds, *Primary productivity, *Phytoplankton, *Fish farming, Algae, Oxygen, Respiration, Carp, Chlorophyll, Light penetration, Photometry, Photosynthesis, Light intensity.
Identifiers: *Carp ponds, Czechoslovakia.

Meausrement of primary production of phytoplankton in two Czechoslovakian carp ponds were carried out from spring to autumn and the data analyzed from two standpoints: comparison of data obtained by the oxygen and C-14 methods and comparison of primary production and respiration of the plankton. Ratio of the net oxygen production to the assimilated carbon was 0.9 : 1.2 in the upper part of the photic zone. In studies comparing oxygen production in algae with carbon uptake determined by C-14 technique, corrections by arbitrary photosynthetic quotients were avoided. Comparison of the methods is expressed as quotients which are calculated from the values actually measured; the compared methods were in mutual agreement. When phytoplankton was abundant respiration in the light part of day was about 10% of maximum gross production (values per unit volume compared). Net production of planktonic algae per 24 hours per unit surface area was estimated as 55% to 80% of gross production in a small shallow pond. The percentage was stable during three months of a phytoplankton bloom. (See also W73-10895) (Jones-Wisconsin)
W73-10924

PHOTOSYNTHETIC PRODUCTIVITY IN THE AJWA RESERVOIR AT BARODA, WEST INDIA,
Maharaja Sayajirao Univ. of Baroda (India). Dept. of Biochemistry.
S. V. Ganapati, and C. H. Pathak.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 685-692, 1972. 7 tab, 7 ref.

Descriptors: *Photosynthesis, *Productivity, *Reservoirs, Thermal stratification, Energy conversion, Oxygen, Respiration, Physicochemical properties, Dissolved oxygen, Solar radiation, Aquatic plants.
Identifiers: *Ajwa Reservoir (India), *Baroda (West India).

Study of the limnological productivity in the Ajwa Reservoir near Baroda (West India) was conducted in 1963 and 1964. A survey of physicochemical, bacteriological and biological conditions of surface water was undertaken once a month. There was no permanent thermal stratification for any period but it was diurnal in character. In 1963, gross oxygen production varied between 0.42 and 7.64 g/sq m/day and in 1964 between 0.45 and 1.57 g/sq m/day, the annual averages being 3.36 and 0.84 g/sq m/day, respectively. Net oxygen production was found to vary between 0 and 2.06 g oxygen/sq m/day in 1963 and between 0.01 and 0.44 g oxygen/sq m/day in 1964. The annual average ratio of 24-hour respiration to gross production was found to be 79.2% in 1963 and 76.6% in 1964. The annual average photosynthetic efficiency was 0.63% in 1963 and 0.18% in 1964. These values are compared with those of a few temperate and tropical waters. (See also W73-10895) (Jones-Wisconsin)
W73-10925

THE REGULATION OF NET PRIMARY PRODUCTION IN LAKE GEORGE, UGANDA, EAST AFRICA,
Royal Society African Freshwater Biological Team, Lake Katwe (Uganda).
G. G. Ganf.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 693-708, 1972. 9 fig, 3 tab, 12 ref.

Descriptors: *Primary productivity, *Energy conversion, Phytoplankton, Photosynthesis, Respiration, Tropical regions, Biological communities, Bicarbonates, Ions, Oxygen, Growth rates, Nutrients, Light penetration, Cyanophyta, Diatoms, Chlorophyta, Chlorophyll, Solar radiation, Stratification, Temperature.
Identifiers: *Lake George (Uganda), Self-shading.

Phytoplankton is the major source of primary production through direct conversion of solar to chemical energy during photosynthesis in Lake George, western Uganda. The gross photosynthetic rates are high, while net production is relatively low, because most carbon fixed is rapidly recycled via the respiratory cycle. The factors which govern respiratory rates and photosynthetic rates are, therefore, those which regulate net production. The major ecological factors governing photosynthetic rates are light, temperature, and the nutrient balance of the ecosystem. As the light and temperature characteristics of Lake George show little seasonal fluctuation, it may be assumed that they have a fairly constant effect upon the phytoplankton community. Therefore, changes in community density may be attributed to fluctuations in nutrient status or to variations in efficiency of the photosynthetic system. Given a relatively stable environment, the factors which tend to minimize change in the community become important. These factors are manifold but the self-regulation and low magnitude of the net production allows this algal community to maintain itself without radically changing the ecological template or over-exploiting the available nutrients. In this way, the violent populations fluctuations, common in temperate waters, are avoided. (See also W73-10895) (Jones-Wisconsin)
W73-10926

COMPARATIVE TRENDS OF PRIMARY PRODUCTIVITY AND SOME CHEMICAL PARAMETERS IN LAKE MAGGIORE ON A PLURIANNUAL BASIS,
Istituto Italino di Idrobiologia, Pallanza (Italy).
M. Gerletti.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 709-713, 1972. 3 fig, 13 ref.

Descriptors: *Primary productivity, *Water chemistry, Trophic level, Energy conversion, Solar radiation, Photosynthesis, Nutrients, Eutrophication, Conductivity, Nitrates, Phosphorus.
Identifiers: *Lake Maggiore (Italy).

Annual primary production is computed for Lake Maggiore using 14 series presented by Vollenweider (1959-60) and 14 series by Goldman, et al. (1965), all obtained by the C-14 method, using a mean photosynthetic efficiency computed for each group and records of solar radiation of the meteorological observatory. The increase of production is supported by examination of depth profiles of production from surface to 30 meters obtained in Lake Maggiore in successive years. Data show a quite steady increase in electric conductivity and nitrate nitrogen content during the last eleven years. Increase in nutrients must be attributed to human domestic pollution mainly and to a limited amount of industrial pollution. The increased, unevenly distributed human population implies a faster and more complete flow of nutrients into lake waters through the numicipal sewage systems, hitherto not equipped with treatment plants. The most probable source of phosphorus increase is the recent introduction of synthetic detergents. Other observations support a trend towards a situation of 'cultural' eutrophication. In the last ten years recurrently dense Tabellaria populations sometimes reached the bloom stage. In autumn 1967 for the first time Ocillatoria rubescens produced a bloom. (See also W73-10895) (Jones-Wisconsin)
W73-10927

THE PRIMARY PRODUCTIVITY OF A FISH--POND AT ILE-IFE, NIGERIA,
Ife Univ. (Nigeria). Dept. of Biological Sciences; and Eotvos Lorand Univ., Budapest (Hungary). Chair of Plant Physiology.
A. M. Imevbore, G. Meszes, and Z. Boszormenyi.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problesm of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 715-723, 1972. 4 fig, 3 tab, 7 ref.

Descriptors: *Primary productivity, *Fish farming, *Ponds, Phytoplankton, Nutrients, Algae, Photosynthesis, Physical properties, Meteorological data, Tropical regions, Chemical properties, Seasonal, Light penetration, Energy conversion, Biomass, Light intensity, Limiting factors.
Identifiers: *Ile-Ife (Nigeria), Kainji Lake (Nigeria), Fish pond.

Algal photosynthetic activity and productivity studies of West African fresh waters using the C1-4 technique were undertaken in a small fish-pond, while parallel observations were conducted in the Kainji Reservoir. Meteorological data for the area are given. Data obtained for photosynthetic production under natural conditions reflect the combined action of changes in intensity of underwater light penetration and changes in the quantity (activity) of phytoplankton. The low production value obtained in the field in June was not caused by low plankton quantity and activity but rather by low light intensity. High production values between February and June in both natural and artificial conditions were due to both high plankton activity and favorable light. In corollary, generally lower production values during the July-December months, even under artificial illumination, must be attributed to lower plankton activity. Higher production values in the afternoon than in the morning indicate both a circadian rhythm in the phytoplankton and a generally stronger light intensity in the afternoon. In summary, it seems that nutrients limit primary productivity most of the year, but, occasionally light penetration is also limiting. These data are in the range found by Talling (1965) for productivity of East African lakes. (See also W73-10895) (Jones-Wisconsin)
W73-10928

COMPARISON OF SOME METHODS OF DETERMINING THE PRIMARY PRODUCTION OF PHYTOPLANKTON IN PONDS,
Polish Academy of Sciences, Krakow. Zaklad Biologii Wod.
S. Wrobel.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 733-737, 1972. 3 fig, 2 tab, 5 ref.

Descriptors: *Testing procedures, *Primary productivity, *Phytoplankton, *Ponds, Analytical techniques, Chlorophyll, Productivity, Gas chromatography, Eutrophication, Measurement.
Identifiers: Golysz (Poland), Oxygen exchange method, Oxygen method, C-14 method.

Measurement of the primary production of phytoplankton in ponds at Experimental Fishery Farms, Golysz, Poland, were made by several methods. The light and dark bottle method was compared with the C-14 method and with the method of oxygen exchange between water and air. In the two experimental ponds the Cyanophyceae species pervailed with a predominance of Microcystis aeruginosa, while in another pond Volvox aureus prevailed. The small number of experiments does not permit drawing any detailed conclusions. It is certain, however, that the value of total production calculated by the oxygen method in eutrophic waters is 15-20% lower than in actuality; for the value of net production the difference would probably be twice

UNIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

as great. However, comparing these methods, very similar results of the total production measured by the oxygen method and the C-14 method as well as of the net production estimated by the oxygen method and the gas exchange method are obtained. In highly eutrophic water basins the use of oxygen method is limited. It is concluded that in waters belonging to the extreme types, primary production may be measured only by the C-14 method. (See also W73-10895) (Jones-Wisconsin)

THE EXTENT OF CONSUMPTION OF THE ENERGY CONTAINED IN THE FOOD SUSPENSION OF CERIODAPHNIA RETICULATA (JURINE),
Bailystok Medical Academy (Poland). Dept. of Biology.
B. Czeczuga, and E. Bobiatynska-Ksok.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 739-748, 1972. 5 fig, 2 tab, 36 ref.

Descriptors: *Productivity, *Energy conversion, *Nutrient requirements, *Crustaceans, Energy transfer, Respiration, Food chains, Metabolism, Animal growth, Reproduction, Algae.
Identifiers: *Ceriodaphnia reticulata, Energy assimilation.

The importance of determining the energy metabolism of Ceriodaphnia is based on its importance as food in the early stages of fry development of various fish species. The number of the algal cells consumed was calculated from the differences in suspension concentrations. The algae used were Chlamydomonas nivalis, Chlorella elipsoidea, Chlorella vulgaris, Ankistrodesmus falcatus var. duplex, and Scenedesmus obliquus. C. reticulata specimens were divided into three groups: small, medium, and large, mature. Twenty small, 10 middle-sized and 10 large specimens were placed in 20 ml of suspension. Number of cells consumed was calculated from the differences in the suspension concentrations by means of a Burker camera. The caloric value of the various algal species and in the size groups of C. reticulata was determined by means of a calorimetric microbomb. Respiration intensity was determined by Warburg apparatus. Ratio of number of calories taken in with food, burnt during respiration, assimilated with food, to number of calories contained in the food suspension, percent of consumption of reserves in food suspension and coefficient K-1 and K-2 for each growth group of C. reticulata fed with different algal species were recorded. (See also W73-10895) (Jones-Wisconsin)
W73-10930

COMPARISON OF THE PHYSICAL AND CHEMCIAL ENVIRONMENTS OF VOLTA LAKE AND LAKE NASSER,
Lake Nasser Development Centre, Aswan (Egypt).
B. Entz.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 883-891, 1972. 1 fig, 6 tab, 2 ref.

Descriptors: *Lakes, *Physical properties, *Chemical properties, *Africa, Eutrophication, Oligotrophy, Turbidity, Tropical regions, Productivity, Phytoplankton, Oxygen, Hydrogen ion concentration, Nutrients, Temperature, Winds, Bottom sediments.
Identifiers: *Volta Lake (Africa), *Lake Nasser (Egypt).

Comparison is made of some limnological conditions in two recently created African lakes: Volta Lake, oligotrophic, is entirely within the tropics, while Lake Nasser, eutrophic, has tropical and subtropical sections. In Volta Lake, Microcystis water-blooms developed shortly after the floods; in Lake Nasser a strong 'water coloration' appeared in the second half of the flood season, caused mainly by Volvox. The level of oxygen saturation in Volta Lake is mainly influenced by the wind. The bottom is covered with decomposing trees, bushes, grass, or soil with high organic matter content, and there is a still continuing oxygen reduction taking place in the water mass. Oxygenation through the surface is the main source of dissolved oxygen. In Lake Nasser the oxygen situation is quite different: during winter and spring months oxygen concentrations near the surface were as high as 110-160% of the saturation level caused by a high photosynthetic rate. Wind is a much more important temperature regulating factor than it is on Volta Lake. The richness of Lake Nasser, a cause of intensive photosynthesis, is responsible for pH levels which are much higher than thos in Volta Lake. (See also W73-10895) (Jones-Wisconsin)
W73-10931

SOME CHARACTERISTICS OF A SHALLOW ENDORHEIC LAKE IN ITS DRYING PHASE AND ITS REVOVERY PHASE. LAKE CHILWA (MALAWI),
Malawi Univ., Limbe.
N. P. Mwanza.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 897-900, 1972. 6 ref.

Descriptors: *Lakes, *Shallow water, *Dry beds, Tropical regions, Saline water, Biological communities, Conductivity, Phytoplankton, Zooplankton, Fish, Alkalinity, Algae, Bacteria, Invertebrates.
Identifiers: *Lake Chilwa (Malawi).

Lake Chilwa, Malawi, Africa, is a shallow tropical lake which undergoes drying and flood conditions. During dry years, life all but disappears, but during recovery biological communities reappear. This is summarized in context of the salinity changes. The changing salt content seems to be due only to dilution and evaporation. Quantitative studies of bacterial populations during the drying phase show lower counts when salinity and alkalinity have risen, and higher counts during recovery. Algal studies during the two phases show considerable changes in abundance and type. During the drying phase the flora consists of only a few species of Cyanophyta and diatoms. The recovery phase was characterized by the development of a more diverse flora with many algae of Chlorophyta and Chrysophyta species. The Chlorophyta include many Volvocales which cover the water surface with a more or less continuous green sheet. During the drying phase observations of zooplankton abundance and breeding were noted, while in the recovery phase intensive studies of horizontal distribution of species in open water, bay and marshes and of quantitative composition, periodicity, and cyclomorphosis are being made. There are three species of commercially important fish. During recovery phase a program of restocking with the endemic Tilapia species was initiated. (See also W73-10895) (Jones-Wisconsin)
W73-10932

ON THE QUALITATIVE CHARACTERISTICS OF THE PHYTOPLANKTON OF THE NATRON ('SZIK') PONDS OF HUNGARY,
Damjanich Muzeum, Szolnok (Hungary). Laboratorium Tisza-Forsch.
G. Uherkovich.
In: Proceedings of the IBP-UNESCO Symposium on Productivity Problems of Freshwaters, May 6-12, 1970, Kazimierz Dolny, Poland, p 913-918, 1972. 3 fig. 9 ref.

Descriptors: *Phytoplankton, *Ponds, Saline water, Cyanophyta, Indicators, Diatoms, Carbonates, Bicarbonates, Hydrogen ion concentration, Biological communities, Scenedesmus, Water chemistry.
Identifiers: *Natron ponds, *Hungary.

In contrast to salt lakes characterized by their considerable sodium chloride concentrations, lakes with higher concentrations of sodium carbonate and sodium bicarbonate-natron lakes are comparatively rare. A number of natron ponds are present in the region between the rivers Danube and Tisza (Hungary) in deflated depressions and also east of the River Tisza in dried-out riverbeds. Quantitative composition of the cenoses is a more revealing indicator of their salt water character than mere qualitative description, as they are composed of 55.5% salt water on the average. The great variation of phytoplankton cenoses is shown in the profound changes which may occur in a very short time. Cenoses of phytoplankton with the largest populations are invariably composed of representatives of salt water organisms in proportions greater than 90%. The most numerous cenoses are usually caused by the multiplication of one or two Cyanophyta organisms (like Dactylococcopsis rupestris, Phormidium fragile, Gomphosphaeria aponina, Lyngbya limnetica). Presence of certain salinity-indicator organisms of the Bacillariophyceae species is usually typical of these cenoses. (See also W73-10895) (Jones-Wisconsin)

THE BOTTOM FAUNA IN AN OIL-CONTAMINATED LAKE,
Lund Univ. (Sweden). Limnological Inst.
L. Bengtsson, and H. Berggren.
Ambio, Vol 1, No 4, p 141-144, 1972. 3 fig, 2 tab, 17 ref.

Descriptors: *Benthic fauna, *Lakes, *Oil pollution, Water pollution effects, Bottom sediments, Biological communities, Urban runoff, Sampling, Rehabilitation, Hypolimnion, Aeration, Spectrophotometry, Oligochaetes, Diptera, Tubificids, Toxicity.
Identifiers: *Lake restoration, Jarla Lake (Sweden), Industrial runoff.

Results of analyses of bottom sediment samples from Jarla Lake, Sweden, showed that the oil content increases towards the bay where the main runoff water outlets are situated. Lack of macrobenthos at lower depths and improverished bottom fauna indicate a very strong influence of the oil and oil derivatives in the waste water runoff. The oil content of sediment can affect the organisms mechanically and physiologically and may also be toxic. Normally macrobenthos consume fresh settled material, older sediment material, build tubes in the sediment and pump oxygen-rich water through these, aerate the sediment surface by their respiratory movement, move sediment--which is altered during passage through the intestinal cannal--from beneath to the sediment surface and make it available for aerobic microbial decomposition. Their fish predators mix the surface of the sediment in attempting to catch them. Studies have been concentrated on different methods of reducing oil content in waste water and on the effects of oil on the efficiency of sewage plants. Large quantities of oil enter receiving water with runoff water which originates from filling stations, industrial areas and roads. (Jones-Wisconsin)

ECOSYSTEM STUDIES IN CONNECTION WITH THE RESTORATION OF LAKES,
Lund Univ. (Sweden). Limnological Inst.
L. Bengtsson.
Verhandlungen der Internationalen Vereiningung fur Theoretische und Angewandte Limnologie, Vol 18, p 379-387, 1972. 7 fig, 2 tab, 6 ref.

Descriptors: *Ecosystems, *Lakes, *Rehabilitation, *Water pollution treatment, Eutrophication, Projects, Biological communities, Aquatic plants, Sediments, Water levels.
Identifiers: *Lake restoration, Lake Trummen (Sweden), Lake Hornborga (Sweden).

The lake restoration research program at the University of Lund, Sweden, is an interdisciplinary ecological as well as an ecological-technical collaboration to study principles for solution of severe environmental problems caused by man, restoration of some especially valuable lakes, to train ecologists for solving problems in applied water management, and to gain knowledge in theoretical ecology. The two lakes considered were Trummen and Horborga; results are presented. In Lake Trummen, by means of a suction dredger 1 m sediment is pumped from the lake onto the land, 0.5 m in 1970 and another 0.5 in 1971. Altogether 600,000 cu m gyttja and 300,000 cu m lake water were pumped to settling ponds. From these the mixture of lake and interstitial runoff water is treated with aluminum sulphate before returning to lake Trummen. Through the restoration the water volume increases about 70%. Lake Hornborga, which had been unsuccessfully lowered to gain arable land, had been considered an important Western Eutropean waterfowl refuge. In considering the raising of the water level for restoration, the accumulated masses of coarse Phragmites detritus had to be reduced and primary production redistributed. Although the projects had not been completed, improvements are evident. (Jones-Wisconsin)

THE GENETICS OF BLUE-GREEN ALGAE,
University Coll., Galway (Ireland). Dept. of Microbiology.
J. A. Houghton.
Science Progress, Oxford, Vol 60, No 239, p 407-412, 1972. 51 ref.

Descriptors: *Genetics, *Cyanophyta, *Algae, Phyllogeny, Cytological studies, Metabolism, Reproduction, Reviews.

The phyllogenetic position of blue-green algae is still speculative and a comparison of the gentic system of blue-green algae and those of bacteria and other algae might provide very useful information, especially for their economic exploitation. An attempt is made to clarify present knowledge of their genetics. Until recently, blue-green algae were regarded as reproducing primarily by binary fission. Much of the genetic work published to date has been concerned with induction of mutants, recombination studies, and genetic mapping. Bazin showed quite conclusively that genetic recombination could occur in Anacystis nidulans. The results indicated that genetic transfer followed by recombination was taking place between two strains, providing clear evidence for sexuality, and thus making genetic mapping more feasible. Some spontaneous mutants, for example mutations affecting cell division, have been isolated but most recent techniques have involved use of chemical mutagens. Ultraviolent light has also been used in the isolation of mutants from Anabaena doliolum and A. cycadeae. A temporal genetic map of six cistron has been prepared. Other approaches to genetic mapping are the use of genetic transformation and use of transduction; blue-green algal viruses have been isolated which make the latter technique feasible. COMPLEXING PROPERTIES OF NITRILOTRIACETIC ACID IN THE LAKE ENVIRONMENT,
Department of Energy, Mines and Resources, Burlington (Ontario). Canada Center for Inland Waters.
Y. K. Chau, and M. T. Shiomi.
Water Air Soil Pollut. Vol 1, No 2, p 149-164, 1972. Illus.
Identifiers: Acetic-Acid, Cadmium, Copper, Environment, Lakes, Mercury, Nickel, *Nitrilotriacetic acid.

Recent proposals to limit the phosphate content of detergents have prompted the detergent industry to investigate possible phosphate substitutes. The trisodium salt of nitrilotriacetic acid (NTA) was one of the most promising compounds proposed. At concentrations above 1 ppm NTA can react with sparingly soluble compounds to release the metal and associated anions through complexation. It also interacts with sediment to release certain metals depending on the abundance of the metals in the sediment. In situ and laboratory experiments were carried out to study such interactions and also to follow the fate of these released metals after NTA has degraded. Degradation of certain NTA-metal complexes in lake water medium was also studied. Certain NTA complexes (Cu, Ni, Cd, Hg) were very resistant to degradation.--Copyright 1972, Biological Abstracts, Inc.

THE EFFECT OF NUTRIENT FERTILIZATION ON THE BENTHIC ALGA ULVA LACTUCA,
Harvard Univ., Cambridge, Mass. Lab. of Applied Microbiology.
T. Waite, and R. Mitchell.
Botanica Marina, Vol 15, No 3, p 151-156, 1972. 4 fig, 20 ref.

Descriptors: *Productivity, *Estuaries, *Fertilization, *Benthic flora, Marine algae, Nutrients, Biomass, Plant growth, Massachusetts, Ammonia, Phosphates, Carbon fixation, Photosynthesis, Enzymes, Nitrogen, Mathematical models, Coasts, Eutrophication, Sea water, Limiting factors.
Identifiers: *Ulva lactuca, Nahant (Mass).

Large benthic algal biomass caused by fertilization hinders water movement in shellfish beds, and during degradation, hydrogen sulfide is released. Nutrients which might be 'limiting' to growth of Ulva lactuca at Nahant, Massachusetts, were determined and an algal nutrient response surface showing interaction of two nutrients was constructed. Continuous monitoring gave ammonia nitrogen, nitrate nitrogen, and phosphate phosphorus values. Nitrogen enrichment was made with ammonia nitrogen, the main nitrogen form in domestic sewage, eliminating possibility of the plants' taking up other forms of nitrogen. C-14 incorporation, as a growth parameter, in benthic macrophytes was discussed. Ulva productivity response to phosphate and ammonia enrichments is complex. Ammonia stimulates plant growth at certain concentrations and inhibits productivity at others. Ulva may be stimulated by either ammonia or phosphate, indicating that concept of a 'limiting' nutrient probably is not applicable to define Ulva growth in nature. Productivity was inhibited in ammonia concentrations exceeding 60 micromoles regardless of phosphate concentration. Maximum productivity was observed at ammonia concentration of 43 micromoles and phosphate concentration of 19 micromoles. Baule-Mitcherlich equation is proposed as possible model for nutrient interaction in growth rate determination. (Jones-Wisconsin)

CONTROL OF ALGAE,
Imperial Chemical Industries Ltd., Jealott's Hill (England). Jealott's Hill Research Station.
A. F. Hawkins.
Outlook on Agriculture, Vol 7, No 1, p 21-26, 1973. 2 fig, 1 tab, 40 ref.

Descriptors: *Algal control, *Fungicides, *Algicides, *Herbicides, Nuisance algae, Copper sulfate, Algal toxins, Reservoir design, Turbulence, Diquat, Aquatic weed control, 2-4-D, Dalpon, 2-6-dichlobenil, Irrigation canals, Marine algae, Navigation, Paints, Chlorination, Agronomic crops, Aminotriazole, Urea pesticides, Biocontrol, Rice, Fungicides, Australia.
Identifiers: Anti-fouling paints, Maleic hydrazine, Acrolein, Triazines, Xylol, Phytotoxic oils, Diuron, Holland, Organotin fungicides, Fentin acetate, India, Italy, Philippines.

There is an urgent need for short-term measures to alleviate problems caused by algae. Situations where short-term measures are needed or are in use are discussed. The only compound used in quantity on a world scale is cooper sulfate pentahydrate, which presents no danger to man when used in controlled concentrations. The provision of multiple storage units in pumped storage reservoirs allows them to be taken out of service at times of maximum infestation; similarly, provision of outlets at various levels permits the cleanest water to be drawn off selectively. Future reservoir construction is likely to be designed for maximum depth with minimum surface area--conditions unfavorable for dense algal growths. Another approach is to prevent thermal stratification by installation of pumps. Diquat has been used with success against blooms of blue-green algae in Israel, where algal poisoning is a recurrent problem in small ponds and impoundments. Algae may be resistant to herbicides used for aquatic weed control; in Lake Rotoiti, New Zealand, a heavy infestation of Lagarosiphon major was cleared by diquat, only to be replaced by Nitella. The use and effects of algicides, herbicides, and fungicides in the Netherlands, Australia, United States, and in the Philippines are also described. (Auen-Wisconsin)

POTENTIAL HETEROTROPHY IN A NATURAL POPULATION OF OSCILLATORIA AGARDHII VAR. ISOTHRIX SKUJA,
Michigan Univ., Ann Arbor. Dept. of Zoology.
G. W. Saunders.
Limnology and Oceanography, Vol 17, No 5, p 704-711, 1972. 1 fig, 1 tab, 24 ref.

Descriptors: *Algae, *Metabolism, *Plant populations, *Biochemistry, Cyanophyta, Plant growth, Adsorption, Plant growth substances, Plant physiology.
Identifiers: *Oscillatoria agardhii, Glucose, Acetate, Heterotrophy, Dark.

That some algae can grow in the dark on organic substrates has been demonstrated many times in culture. Substrate concentrations, however, are 1,000 to 100,000 times greater than have been found in uncontaminated waters. The data presented for Oscillatoria agardhii var. isothrix show conclusively that this algae can assimilate glucose in situ in the dark at approximately natural concentrations; it can also assimilate acetate. Three other blue-green algae, Oscillatoria utermoehlii, Oscillatoria sp., and Arthrospira sp., are able to assimilate glucose in the dark and two of these species can also assimilate acetate. They occur maximally in the interphase between aerobic and anaerobic conditions and all extend downward into waters containing hydrogen sulfide. Radioatography of the four species tested gives evidence that they can take up glucose-C14 and acetate-C14 at the low concentrations occurring in lake water. The glucose-C14 uptake kinetics by O. agardhii demonstrated that they are metabolic. The quantitative importance of such uptake in the development of algal populations cannot be assessed from the data but the fact that O. agardhii develops massive densities in the microaerobic

LIBRARY OF U. OF I. URBANA-CHAMPAIGN

zone of many lakes suggests that heterotrophy may be very important to it and perhaps to other species occupying this habitat. (Auen-Wisconsin)

'BRINGING SICK LAKES BACK TO HEALTH',
Lund Univ. (Sweden). Limnological Inst.
S. Bjork.
Teknisk Tidskrift, No 11, p 1-7, 1972. 7 fig.

Descriptors: *Eutrophication, *Social aspects, *Water pollution effects, Water levels, Adoption of practices, Costs, Thermal stratification, Oxygenation, Aeration, Water pollution treatment, Drainage programs, Harvesting, Wildlife conservation, Project purposes, Rehabilitation, Water birds, Dredging, Environment.
Identifiers: *Lake restoration, Lake Trummen (Sweden), Lake Jarla (Sweden), Lake Hornborga (Sweden), Water level reduction.

Limnologists and engineers have cooperated to restore three Swedish lakes of different types, each with suitable different treatment methods. In Lake Trummen, the entire cultural sediment layer was removed; since then the oxygen content during winter has been excellent and a good environment has been created for fish. However, the building of a motorway along and across the southern part has been proposed; this would completely ruin the restored environmental unit of the lake and its surroundings. The restoration of Lake Jarlasjon was accomplished by aeration utilizing a method of raising the oxygen content in the hypolimnion without disturbing the thermal stratification. The water level of Hornborgasjon has been lowered on several occasions in unsuccessful attempts to obtain arable land. The draining only transformed the lake into a vast marsh. Hornborgasjon had been considered one of the finest waterfowl lakes in Western Europe and it was invaluable both as a migration resting place and as a nesting site for waterfowl. Before the water level could be raised, the damage caused by drainage had to be repaired. The restoration methods for these projects were developed in large-scale field experiments. (Jones-Wisconsin)

BIBLIOGRAPHY ON THE ECOLOGY AND TAXONOMY OF MARINE ALGAE,
California Univ., San Diego, La Jolla. Inst. of Marine Resources.
M. Neushul, and D. Coon.
Available from the National Technical Information Service as COM-72-11426, $3.00 in paper copy, $0.95 in microfiche. Sea Grant Publication No 21, August 1972. 10 p, 86 ref (IMR Reference No 73-1).

Descriptors: *Marine plants, *Bibliographies, *Ecology, *Systematics, Marine algae, Biological communities, Cytological studies, Biochemistry, Phytoplankton, Benthic flora, Oceans.

In this bibliography of 86 citations, dealing with the extent and diversity of marine algae, published in both foreign and English languages, emphasis is placed on taxonomic and, particularly, ecological studies. Citations are divided into those dealing with marine benthic algae and marine phytoplankton. Taxonomic studies usually begin with what has been called alpha taxonomy followed by assessments that can involve cytological, biochemical, numerical and experimental approaches. The spreading, adverse impact of man on world ecosystems makes it imperative that progress is made very rapidly from the first ecological reconnaissance and taxonomic studies through to definitive quantitative ones. One of the most essential tools of the marine ecologist is regional flora. Observations are made on the east and west coasts of the United States. Application of scuba techniques and various methods of sampling in benthic marine habitats are discussed. Autecological studies of benthic marine algae have most frequently emphasized the larger kelps. Of interest are studies of specific oceans, productivity and the growth of marine phytoplankton, populations and general concepts of plankton organization, aspects of physiology and ultrastructure of specific diatoms, chrysophytes in general, and general principles of phytoplankton ecology. CARBON IN FRESHWATER SYSTEMS,
Michigan State Univ., Hickory Corners. W. K. Kellogg Biological Station.
R. G. Wetzel, and P. H. Rich.
1972. 34 P, 5 FIG, 10 REF.

Descriptors: *Carbon, *Freshwater, Carbon dioxide, Photosynthesis, Metabolism, Bicarbonates, Detritus, Productivity, Cycling nutrients, Hydrogen ion concentration, Carbon cycle, Nutrients, Adsorption.
Identifiers: Lawrence Lake (Mich), Carbon flux, Organic carbon, Inorganic carbon.

Evidence is available that among the enormous diversity of concentrations and states of inorganic carbon in freshwaters there exist many situations where free carbon dioxide in equilibrium with the atmosphere may be inadequate for metabolism or indirectly inadequate as a result of chemical losses from the system. Possession of an affinity for bicarbonate is an adaptive advantage in a significant percentage of aquatic life, particularly for larger submersed angiosperms. The organic carbon budgets as given for Lawrence Lake, Michigan, serve as an example to illustrate the various inputs, losses, and utilization relation of organic carbon. The pelagic organic carbon budget indicates losses of DOC considerably exceed inputs resulting in net production of 17 gC/sq m/yr. In contrast, particulate organic carbon production exceeds losses and results in a total organic net production of 3 gC/sq m/yr for the pelagic zone. The importance of the littoral region, not only its contribution to autochthonous production but also its indirect effects on pelagic and benthic carbon metabolism is emphasized. The concept of net ecosystem productivity is reviewed and applied. The relative contributions by differeing modes of metabolism to dissolved and particulate carbon pools is considered. ECOLOGY OF VIBRIO PARAHAEMOLYTICUS IN CHESAPEAKE BAY,
Georgetown Univ., Washington, D.C. Dept. of Biology.
T. Kaneko, and R. R. Colwell.
Journal of Bacteriology, Vol 113, No 1, p 24-32, January 1973. 3 fig, 5 tab, 35 ref.

Descriptors: *Water analysis, *Zooplankton, Cultures, Water temperature, *Distribution patterns, Sediments, Niches, Seasonal, Marine bacteria, Pathogenic bacteria, Detritus, Separation techniques, Sampling, Population, Biological communities, Path of pollutants, Aquatic populations, Rivers, Estuaries, *Chesapeake Bay.
Identifiers: *Vibrio parahaemolyticus, *Culture media, Water quality requirements, Viable counts, Chitin, Rhode River.

The seasonal incidence of Vibrio parahaemolyticus was studied to determine its ecological niche in the natural environment; its habitat and role in the natural cycles of plankton, water, and sediment; and the mechanisms by which it survives the winter. Samples of sediment, plankton, and water were collected monthly from the Rhode River in Chesapeake Bay. For total viable counts YE and SWYE media were used. Vibrio parahaemolyticus was isolated on TCBS medium. Bacterial counts were made for unfiltered water, filtrates, zooplankton, and sediments. The incidence of Vibrio parahaemolyticus and related vibrios was found to be correlated with water temperature. The vibrios could not be detected in the water column during the winter months, although they were present in sediment. From later spring to early summer, when water temperatures were 14 plus or minus 1 C, vibrios over-wintering in sediment were released from the bottom communities and attached to zooplankton, proliferating as the temperature rose. The number of vibrios in and on plankton was reflected in the water column bacterial population densities at water temperatures of ca. 19 C. Interaction between sediment, water, and zooplankton was essential in the natural estuarine ecosystem. The bacterial population associated with zooplankton was predominantly on external surfaces and was specific, differing from that of the sediment. Vibrio spp. and related organisms comprised the total bacterial population associated with zooplankton in summer months. The ecological role of Vibrio spp., including Vibrio parahaemolyticus, was significant, with respect to their property of chitin digestion and in relation to the population dynamics of zooplankton in Chesapeake Bay. GROWTH OF A FLOATING AQUATIC WEED, SALVINIA UNDER STANDARD CONDITIONS,
Makerere Univ., Kampala (Uganda). Dept. of Botany.
J. J. Gaudet.
Hydrobiologia, Vol 41, No 1, p 77-106, February 28, 1973. 11 fig, 15 tab, 34 ref.

Descriptors: *Aquatic plants, *Floating plants, Ferns, Growth rates, Cultures, Bioassay, Light intensity, Carbon dioxide, Calcium, Strontium, Heavy metals, Nitrogen, Phosphorus, Absorption, Nitrates, Ammonia, Phosphates, Hydrogen ion concentration, Conductance, Dissolved oxygen, Ureas, Sulfates, Iron, Potassium, Sodium, Magnesium, Zinc, Manganese, Cobalt, Molybdenum, Aluminum, Copper, Titanium, Nickel, Chromium, Chlorophyll, Plant pigments, Water analysis, Amino acids, Boron.
Identifiers: *Salvinia molesta, *Salvinia minima, Culture media, C-14, Tin, Alanine, Glutamine, Glutamic acid, Biological samples, Silicon, Scenedesmus species, Synedra, Navicula species, Amphora species, Cymbella, Nitzschia, Surirella, Pediastrum.

Experimental flasks containing basal nutrient medium were inoculated with stock cultures of Salvinia minima or S. molesta and placed in growth chambers for investigation of factors affecting growth rates. Determinations were made of

total nitrogen, pigments, amino acids, trace elements and C-14 uptake in plants and pH, conductance, DO, NO3, urea, ammonium, PO4, SO4, total iron, K, Na, Mg, and Ca in water. The results obtained were as follows: (1) Growth of the floating aquatic weed, Salvinia, in sterile culture was exponential for at least 2 weeks under standardized conditions. (2) Increase in light intensity or in CO2 resulted in increases in growth rate, but did not extend the exponential period of growth. (3) This aquatic plant, like many others, discriminates against calcium relative to strontium. (4) In culture Salvinia exhibited luxury consumption of N and P. (5) Because of high C/N ratios, Salvinia may not be a favorable source of animal food, but might be useful in nutrient removal schemes. (6) In sterile culture, Salvinia molesta produced fewer leaves than Salvinia minima, but maintained a significant increase in leaf area and dry weight. This may be correlated with the ability of the first species to rapidly spread over tropical waterways. (Little-Battelle)

ALGAL RESPONSE TO DETERGENT PHOSPHATE LEVELS,
North Carolina Univ., Chapel Hill. School of Public Health.
D. E. Francisco, and C. M. Weiss.
Journal Water Pollution Control Federation, Vol 45, No 3, p 480-489, March 1973. 5 fig, 7 tab, 15 ref.

Descriptors: *Aquatic algae, *Detergents, *Phosphates, *Bioassay, Waste water (Pollution), Water pollution, *Eutrophication, Nutrients, Plant growth, Sewage treatment, Tertiary treatment, Water sampling, Water analysis, Physicochemical properties, Chlorophyta, Sewage effluents, Biochemical oxygen demand, Carbon, Suspended solids, Nitrates, Nitrites, Ammonia, Alkalinity, Hydrogen ion concentration, Chemical analysis, Aquatic plants, *North Carolina.
Identifiers: *Selenastrum capricornutum, Organic carbon, Kjeldahl nitrogen, Lake Michie, University Lake.

Algal assays were performed on treated wastewaters, some containing phosphate detergents and others containing a non-phosphate detergent. The controls for the bioassay were established using raw wastewater. Each test and control culture was prepared in triplicate, with a total volume of 100 ml in a flask seeded with 1000 cells/ml of the test alga, Selenastrum capricornutum. The flasks were capped loosely with aluminum foil, incubated at 24 C under 400 ft-c of cool-white fluorescent illumination, and swirled once daily. Growth response of the test alga was determined at 3, 5, 7, 10, and 14 days by hemocytometer counting. For growth comparison, the standard algal assay medium (NAAM) was used. In general, phosphate detergent wastewater allowed the same growth as did non-phosphate detergent wastewater at each level of treatment. Tertiary treatment for phosphorus removal resulted in much less growth than secondary treatment. Tertiary-treated phosphorus detergent wastewater allowed significantly greater growth than the non-phosphorus wastewater at a concentration of 2 percent. Simply removing detergent phosphates from wastewater apparently will not control eutrophication, except where the receiving water is very strongly phosphorus-limited and wastewater is the principal phosphorus source, but may allow significantly better tertiary phosphorus removals. THE REACTIONS OF ROACH (RUTILUS RUTILUS (L.)) TO CHANGES IN THE CONCENTRATION OF DISSOLVED OXYGEN AND FREE CARBON DIOXIDE IN A LABORATORY CHANNEL,
Ministry of Agriculture, Fisheries and Food, London (England). Salmon and Freshwater Fisheries Lab.
B. Stott, and D. G. Cross.
Water Research, Vol 7, No 5, p 793-805, May 1973. 3 fig, 6 tab, 14 ref.

Descriptors: *Dissolved oxygen, *Carbon dioxide, Water pollution effects, *Bioassay, *Fish behavior, Channels, Anaerobic conditions, Freshwater fish, Oxygen sag, Laboratory tests, Laboratory equipment, Volumetric analysis, Anaerobic conditions.
Identifiers: Rutilus rutilus, *Avoidance reactions, *Roach, Dropping mercury electrode.

Experiments were carried out with roach (Rutilus rutilus) in a laboratory channel to determine their behavior in relation to levels of dissolved oxygen and free carbon dioxide. The channel was made by joining 9 iron-framed glass aquaria by PVC pipe set in marine plywood at the end of the aquaria. The sides of the aquaria were covered with polyethylene sheeting to prevent the fish seeing out. Dechlorinated, deoxygenated water was used and N2 was bubbled through aerators to replace the air above the channel. Before experiments on avoidance reactions were started between 25 and 30 roach, 10-12 cm long, were introduced into the apparatus, confined to an area consisting of either tanks 1-4, or 1-5, and fed on Tubifex and Daphnia. The fish were kept in the original area for at least 5 weeks before a homing experiment was attempted. This consisted of opening the gate at the downstream end of the area and driving the fish to tanks 8 or 9 with a hand net and the light from a torch. All the gates in the channel were then closed and the fish allowed about 1 h to settle down before all the gates were re-opened by remote control. Subsequently the positions of the fish were noted at intervals of about 2 h. Falling concentrations of dissolved oxygen in the channel caused the roach to move downstream to better oxygenated water by means of a predominantly appropriate response. When an aerated water flow was restored the fish quickly reoccupied their original position. Fish newly introduced into the channel responded in a similar manner except that they did not return to the original position. Roach acclimated to a reduced level of dissolved oxygen needed a rather lower oxygen level to cause the downstream movement. An increase in the amount of free carbon dioxide together with a reduction in oxygen content induced fish to respond to higher levels of oxygen than if the oxygen only was reduced. (Holoman-Battelle)

TOXICITY, RESIDUE DYNAMICS, AND REPRODUCTIVE EFFECTS OF PHTHALATE ESTERS IN AQUATIC INVERTEBRATES,
Bureau of Sport Fisheries and Wildlife, Columbia, Mo. Fish-Pesticide Research Lab.
H. O. Sanders, F. L. Mayer, and D. F. Walsh.
Environmental Research, Vol 6, No 1, p 84-90, March 1973. 3 tab, 22 ref.

Descriptors: *Crayfish, *Midges, Mayflies, Toxicity, Bioassay, Reproduction, Absorption, Daphnia, Water pollution effects, Acaricides, Pesticide toxicity, Pesticide residues, Crustaceans, Invertebrates, Nymphs.
Identifiers: *Phthalate esters, *Biological magnification, *Scuds, *Glass shrimp, *Palaemonetes kadiakensis, *Aquatic sowbug, Bioaccumulation, Plasticizers, Daphnia magna, Gammarus pseudolimnaeus, Orconectus nais, Asellus brevicaudus, Ischnura verticalis, Hexagenia bilineata, Chironomus plumosus, Phthalate esters, Macroinvertebrates.

Scuds (Gammarus pseudolimnaeus), glass shrimp (Palaemonetes kadiakensis), crayfish (Orconectes nais), waterfleas (Daphnia magna), aquatic sowbugs (Asellus brevicaudus), and three species of immature aquatic insects, damselfly nymphs (Ischnura verticalis), burrowing mayflies (Hexagenia bilineata), and midge larvae (Chironomus plumosus) were collected from streams and ponds in Missouri for use in studying the bioaccumulation, biomagnification, and toxicity of di-2-ethylhexyl and di-n-butyl phthalates. Acute toxicity tests were conducted for 96 hours under static conditions as TL50 values. Accumulation experiments were conducted in an intermittent-flow system. The phthalate esters were labeled with C-14 for radiometric analysis of water and organisms. Reproductive tests were conducted with Daphnia in the intermittent-flow system with concentrations of 3, 10, and 30 ppb. The acute toxicities were low and ranged from 2.1 mg/liter to greater than 32 mg/liter. Residue accumulation was rapid resulting in body residues 70-13,600 times that of the water concentration. Phthalate residues were essentially gone after 10 days in fresh water. A reproductive impairment of 60 percent occurred in Daphnia magna exposed continuously to 3 ppb of di-2-ethylhexyl phthalate. (Little-Battelle)

MICROBIAL COMMUNITY STRUCTURE IN CONTAMINATED ESTUARIAN SEDIMENTS,
North Texas State Univ., Denton.
A. Roach, J. K. G. Silvey, and R. K. Guthrie.
Journal Water Pollution Control Federation, Vol 45, No 2, p 365-368, February 1973. 2 fig, 13 ref.

Descriptors: *Biological communities, *Estuarine environment, *Sediments, *Distribution patterns, *Bacteria, Sampling, Ecology, Culture, *Texas, Gulf Coast.
Identifiers: Data interpretation, Culture media.

Punch cores were taken at 4-m intervals along transects in estuarian flats near Flour Bluff, Texas. One tenth ml of mud from a subcore drawn at 2 dm of each core and at each 0.5 dm of the cores was diluted 1:1,000 and placed on an extract medium. The extract medium was designed to give the broadest possible cross section of microbial population and was prepared by (1) adding 500 ml of deionized water to 500 g of mud; (2) cooking for 30 minutes at 90C in a double boiler; (3) allowing mud to settle and decanting; (4) adding 2 g yeast extract, 15 g mannitol, 0.5 g each of calcium sulfate and magnesium sulfate, 20 g agar, and sufficient deionized water to make 1 liter. Frequencies were plotted for each organism encountered on five plates per subcore sample. A Raunkiaeran frequency spectral analysis showed that a structured community rather than a heterogeneous mixture existed laterally over the space of some 80 m in uniform bottom mud. Moreover, such structure resembled that of an undisturbed, climax surface community. A community coefficient analysis showed no significant stratification or vertical discontinuity to a depth of 9 dm. (Little-Battelle)

TOXIC EFFECTS OF MERCURY ON THE ACTIVATED SLUDGE PROCESS,
Maine Univ., Orono. Dept. of Civil Engineering.
M. M. Ghosh, and P. D. Zugger.
Journal Water Pollution Control Federation, Vol 45, No 3, p 424-433, March 1973. 8 fig, 7 tab, 20 ref.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Mercury, *Activated sludge, *Toxicity, *Chemical oxygen demand, *Biomass, *Aerobic conditions, Heavy metals, Reduction (Chemical), Growth rates, Artifical substrates, Absorption, Oxygen.
Identifiers: Volatile suspended solids, Substrates utilization.

A study to determine the toxic effects of mercury on the activated sludge process was made in the laboratory under controlled batch-fed conditions. The threshold mercury concentrations that were required to inhibit biological activities were between 2.5 and 5.0 mg Hg (2 plus)/1, when the food: microorganism ratio was 1.0 and the mixed liquor volatile suspended solids concentration was 2,000 mg/1. However, at dosages as high as 10.0 mg Hg (2 plus)/1, recovery occurred within a few hours. Chemical oxygen demand reduction was obtained in the samples having higher mercury concentrations, but the demand reduction and growth of sludge were both reduced from the conditions present in the nonstressed studies. (Holoman-Battelle)

OSMOTIC REVERSAL OF TEMPERATURE SENSITIVITY IN ESCHERICHIA COLI,
Ottawa Univ. (Ontario). Dept. of Biology.
A. Z. Bilsky, and J. B. Armstrong.
Journal of Bacteriology, Vol 113, No 1, p 76-81, January 1973. 4 fig, 2 tab, 25 ref.

Descriptors: Temperature, *Pollutant identification, *Osmosis, Antibiotics (Pesticides), Stability, Isolation, Environmental effects, *E. coli, Sodium chloride, Coliforms, Enteric bacteria, Aerobic bacteria.
Identifiers: *Mutants, E. coli K-12, *Sensitivity, Bacterial physiology, Biochemical tests, Culture media, Glycerol, Sucrose, Inositol, Potassium chloride, Magnesium chloride, Valinomycin, Lincomycin, Streptomycin, Vancomycin, Bacitracin, Novobiocin, Osmolality, Mutagenicity, N-methyl-N-nitro-N-nitrosoguanidine, Growth media, Deoxycholate, Methylene blue, Ethylenediaminetetraacetic acid, Acridine orange, Acriflavine, Triphenyl tetrazolium chloride.

Forty temperature-sensitive mutants, unable to grow on tryptone or nutrient agar at 42C, were isolated from Escherichia coli K-12. When 0.5 percent NaCl was added to the medium, 32 grew at the nonpermissive temperature. Several were tested with different amounts of NaCl added to tryptone broth; all grew best when the osmolality of the medium was between 400 and 1,000 milliosmolal. One of the mutants was studied in more detail. Sucrose, inositol, KCl, and MgCl2, as well as NaCl, permitted growth at 42C. Glycerol, however, had no effect. When shifted from 30 to 42C without osmotic protection, the mutant stopped growing but did not lyse, die, or leak significant amounts of intracellular material. In a similar shift experiment, a second mutant leaked all of its trichloroacetic acid-soluble pools into the medium. The majority of the mutants were hypersensitive to certain antibiotics, indicating possible cell envelope defects. (Holoman-Battelle)

OBSERVATIONS ON THE TRANSPARENCY OF THE WATERS OF THE PULICAT LAKE WITH PARTICULAR REFERENCE TO PLANKTON PRODUCTION,
Central Inland Fisheries Research Inst., Madras (India).
M. Kaliyamurthy.
Hydrobiologia, Vol 41, No 1, p 3-11, February 28, 1973. 5 fig, 1 tab, 14 ref.

Descriptors: *Zooplankton, *Phytoplankton, *Light penetration, *Aquatic productivity, Primary productivity, Secondary productivity, Turbidity, Plankton nets, Aquatic life, Secchi disks, Tidal effects, Estuarine environment.
Identifiers: *Transparency, Seasonal variation, *India (Pulicat Lake).

The relationship of the transparency of the waters of Lake Pulicat to plankton productivity was investigated for the period January 1968 to December 1970. Light penetration was measured at varying times with a Secchi disc 20 cm in diameter from a stationary boat. Simultaneously, plankton was collected by hauling a 50-cm diameter tow net for 15 minutes. The plankton was fixed in 5 percent formalin and counted using a Sedgwick-Rafter counting cell. Marked sectoral and seasonal variations were observed in relation to transparency but no tidal effects were noted. Varying relationships were noted between plankton and the attenuation coefficient 'k' in the two sectors, of the Lake. (Holoman-Battelle)

THE EFFECTS OF POLLUTION ON GAMMARUS PULEX (L) SUBSP, PULEX (SCHELLENBERG) IN THE INLET STREAMS OF ROSTHERNE MERE, CHESHIRE,
Northumberland Coll. of Education, Newcastle-upon-Tyne (England). Dept. of Environmental Science.
J. E. Hobrough.
Hydrobiologia, Vol 41, No 1, p 13-35, February 28, 1973. 12 fig, 7 tab, 21 ref.

Descriptors: *Water pollution effects, *Life history studies, Amphipoda, Physical properties, Chemical properties, Water sampling, Benthic fauna, Juvenile growth stage, Resistance, Freshwater, Crustaceans, Invertebrates, Aquatic animals, Dissolved oxygen, Water temperature, Biochemical oxygen demand, Electrolytes, Acidity, Hydrogen ion concentration, Diptera, Stoneflies, Streamflow, Mature growth stage, Breeding, Farm wastes, Drainage water, Roads, Midges, Animal populations.
Identifiers: *Macroinvertebrates, *Gammarus pulex, *Rostherne Brook, *Dolls Meadow, England, Scuds, Polycelis felina, Substrates, Chironomids.

Two inlet streams, Rostherne Brook and the Southern Drain of Dolls Meadow, flowing into Rostherne Mere, Cheshire were sampled for macroinvertebrata, and their physical and chemical conditions analyzed. The physical and chemical factors for these streams were similar, except for the stream beds and the pollution of Rostherne Brook. Both streams had large populations of Gammarus pulex and the life history of this organism was studied. The ratio of adult organism to juvenile differed in the two streams, Rostherne Brook having a higher proportion of adults in winter and juveniles in summer as opposed to the Southern Drain in which a normal life history was exhibited. Experiments showed that these differences were not related to differences in stream bed conditions. It was considered that the different adult to juvenile ratios were therefore caused by pollution in Rostherne Brook. The juveniles were more tolerant to pollution and therefore more able to survive the summer when pollution effects were at a maximum. The life history was altered in Rostherne Brook by pollution. Instead of the dual life history produced by overwintering juveniles and speedy summer maturation, a simple alternation of juveniles and adults was seen. This change in life history enabled Gammarus to survive in the polluted waters of Rostherne Brook. (Holoman-Battelle)

5D. Waste Treatment Processes

TECHNICAL, ECONOMIC AND LEGAL ASPECTS INVOLVED IN THE EXCHANGE OF SEWAGE EFFLUENT FOR IRRIGATION WATER FOR MUNICIPAL USE, CASE STUDY - CITY OF TUCSON,
Arizona Water Resources Research Center, Tucson.
C. B. Cluff, K. J. DeCook, and W. G. Matlock.
Available from the National Technical Information Service as PB-220 948, $3.00 in paper copy, $0.95 in microfiche. Completion Report, December 1972. 74 p, 17 fig, 14 tab, 35 ref. OWRR A-022-ARIZ (6). 14-31-0001-3203.

Descriptors: *Water transfer, *Sewage effluents, *Institutional constraints, Economic efficiency, Legal aspects, *Water reuse, *Irrigation water, Water pollution control, Crop response, *Arizona, *Water districts, Nutrients.
Identifiers: Metropolitan wastewater districts, Wastewater recharge, *Tucson, Region.

A case study of the Tucson region illustrates the relevant legal, economic and technical aspects of transferring high quality irrigation water to municipal use in exchange for nutrient-rich treated sewage effluent. In effect, irrigation water would be cycled through the municipal system prior to use on the farms, utilizing existing or new pipelines and evidently without modification of existing statutes. Three basic plans could be instituted in the Tucson region: (1) Exchange with an existing irrigation district; (2) exchange with a newly organized district covering existing irrigated lands; and (3) exchange with a proposed consolidated district owned and operated by metropolitan agencies. To varying degrees, these alternative plans offer the capability of distributing much of the treated effluent over irrigated acreages of crops already being grown in the Avra-Marana area, at delivery cost competitive with that of pumped water. Under each system, the efficiency of use depends upon seasonal blending or alternating of effluent with ground water, in proper proportions. Approximately 20,000 acres would be required to efficiently utilize the projected 1995 effluent production. Any such system contains the inherent advantage of a water-quantity multiplying factor due to reuse. Similar exchange arrangements may prove to be feasible in other regions containing irrigated agriculture.

THE HYDRAULICS OF WASTE STABILIZATION PONDS, PART I. THE EFFECT OF HYDRAULIC FLOW CHARACTERISTICS ON TREATMENT EFFICIENCY, PART II. THE EFFECT OF WIND ON MIXING IN STRATIFIED AND UNSTRATIFIED PONDS.
Utah Center for Water Resources Research, Logan.
G. Z. Watters, K. A. Mangelson, and R. L. George.
Available from the National Technical Information Service as PB-220 955, $3.00 in paper copy, $0.95 in microfiche. Publication PRCWRR18-1, February 1973. 100 p, 64 fig, 13 tab, 65 ref. OWRR A-008-UTAH (4). 14-31-0001-3545.

Descriptors: *Hydraulic flow, Mixing, Sewage lagoons, Dye concentrations, *Tracers, Hydraulic models, Density stratification, Baffles, Diffusion, Treatment, Dispersion, Stratification, Prototypes, *Utah, *Oxidation lagoons, *Waste water treatment.
Identifiers: Logan (Utah), Rhodamine WT, Fluorometer, Cache Valley.

The treatment efficiency of waste stabilization ponds can be influenced significantly by the hydraulic flow patterns within the ponds. To evaluate the effects of shape and depth of the ponds, placement of inlets and outlets, baffling and density stratification an hydraulic model of the prototype Logan City ponds was constructed. The mixing properties of the model ponds were evaluated by injecting a slug of rhodamine WT dye into the inflow and measuring the dye concentration vs time at the outlet. Concentration curves represent the time each dye particle remains in the pond. Coupling this information with the first-order reaction equation provides a measure of treatment efficiency. The position of inlets and outlets was found to change treatment efficiency by about 20%; however, with proper baffling virtually ideal treatment efficiences were obtained. A mathematical (finite-stage) model of the mixing process was adapted to stabilization ponds to determine if a more theoretical design was feasible. The model can be combined with the first-order reaction equation to predict treatment efficiency. A windwater tunnel was constructed to simulate a windover-water situation. A relationship between wind velocity and surface shear stress was established. Diffusion coefficients describing the wind driven mixing of an injected dye were evaluated as functions of the surface shear-velocity Reynolds number. For constant density flows the diffusion coefficient tended toward stabilization at higher Reynolds numbers. The upwind diffusion coefficient was found to be about twice the downwind coefficient. The Reynolds number at which stratification breaks down and complete mixing occurs was established as a function of density differences and relative thicknesses of the two layers.

EFFECTS OF IRON ON ACTIVATED SLUDGE TREATMENT,
Marquette Univ., Milwaukee, Wis.
J. L. Carter, and R. E. McKinney.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol 99, No EE2, p 135-152, April 1973. 9 fig, 3 tab, 24 ref.

Descriptors: *Activated sludge, *Iron, *Sewage treatment, *Metabolism, Heavy metals, Chemical oxygen demand, Biochemical oxygen demand, Temperature, Hydrogen ion concentration, Dissolved oxygen, Suspended solids, Sewage effluents, Chemical reactions, Sewage bacteria, Chemical analysis, Reduction (Chemical), Nutrients, *Waste water treatment.
Identifiers: Pollutant effects, *Substrate utilization, Sludge volume index, Volatile suspended solids, Actinomycetes, Sewage microorganisms, Settleability, Standard methods.

Research was conducted in order to relate the iron ion concentration with the rate of biological metabolism as well as sludge bulking conditions in activated sludge treatment. Five-liter batch activated sludge units were fed glucose and an inorganic substrate using a typical fill and draw procedure. Sodium bicarbonate buffer was used to minimize the precipitation of important elements. Various concentrations of iron were fed during this study. Tests consisting of COD, BOD, MLSS, MLVSS, and sludge volume index (SVI) were conducted to evaluate these systems. Other related parameters such as temperature, pH, dissolved oxygen, and individual ion analysis were periodically measured. Iron was measured using the pyridine method described in 'Standard Methods'. Rates of metabolism were determined by measuring the soluble COD and MLVSS for various time intervals after feeding. Microscopic observations were conducted regularly throughout the research. This work showed that insufficient iron in activated sludge treatment systems decreases the rate of organic metabolism and causes bulking conditions. Variations in other biological treatment parameters may be associated with iron or other inorganic nutrient limitation conditions. (Holoman-Battelle)

POLLUTION ABATEMENT PROCESS FOR REFINERY WASTE WATER,
Texaco Inc., New York. (assignee).
J. P. Tassoney, and R. M. Dille.
U. S. Patent No. 3,725,270, 5 p, 1 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 315, April 3, 1973.

Descriptors: *Patents, Sulfides, Fuels, *Hydrogen sulfide, Gases, *Industrial wastes, *Oil wastes, Oily water, Pollution abatement, *Waste water treatment, Water quality control, Water pollution control, Chemical reactions.
Identifiers: *Refinery wastes, Sour water.

A stream of refinery waste water is introduced into a refractory-lined reaction zone of a free-flow noncatalytic synthesis gas generator in admixture with a hydrocarbonaceous fuel. By the partial oxidation reaction at an autogenous temperature in the range of 1500 to 3000 deg F and a pressure in the range of 1 to 250 atmospheres, the feed to the gas generator is reacted with an oxygen rich gas to produce a hot effluent stream of synthesis gas comprising a mixture of H2, CO, CO2, and H2O and containing a relatively minor amount of H2S, COS, A, N2, CH4 and particulate carbon. The H2S may be recovered and the purified water may be released for disposal. (Sinha-OEIS)
W73-10582

PROCESS FOR REMOVING METAL COMPOUND CONTAMINANTS FROM WASTE WATER,
Haviland Products Co., Grand Rapids, Mich. (assignee).
J. M. Haviland.
U. S. Patent No. 3,725,266, 4 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 314, April 3, 1973.

Descriptors: *Patents, *Industrial wastes, *Metals, *Waste water treatment, Pollution abatement, *Carbonates, Aluminum, Cadmium, Chromium, Copper, Iron, Lead, Manganese, Mercury, Nickel, Zinc.
Identifiers: Silver, Tin, *Hydroxides.

One or more precipitating agents such as hydroxides and carbonates are added to the contaminated water to form a sludge. After settling the sludge is removed and placed in a centrifuge for further treatment. The supernatant liquid may then be disposed without damage to the environment. Fifteen examples are cited. The metal compounds which may be removed in this manner are: aluminum, cadmium, copper, chromium, iron, manganese, mercury, lead, nickel, silver, tin, and zinc. (Sinha-OEIS)

WASTE WATER TREATMENT PROCESS,
Signal Oil and Gas Co., Los Angeles, Calif. (assignee).
D. W. Wheeler.
U. S. Patent No. 3,725,264, 4 p, 1 fig, 2 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 314, April 3, 1973.

Descriptors: *Patents, Pollution sources, *Oil wastes, *Oil pollution, Separation techniques, *Nickel, *Waste water treatment, Catalysts, Chemical reactions, Pollution abatement, *Oil industry, *Industrial wastes.

Controlled amounts of oxygen, air, and a catalyst are injected into waste water containing residual oil and dissolved sulfides. The mixture is pumped under pressure into a flotation cell or tank where the pressure is released and the sulfur and oil are separated from the water by flotation. The catalyst may be any effective water soluble compound, preferably a nickel compound. Three examples are cited. (Sinha-OEIS)
W73-10585

WASTE WATER TREATMENT,
R. H. Harris, and E. F. Morey.
U. S. Patent No. 3,725,263, 5 p, 6 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 314, April 3, 1973.

Descriptors: *Patents, *Coagulation, *Filtration, Chemical reaction, Turbidity, *Waste water treatment, Pollution abatement, Water quality control, Polymers, *Filters.
Identifiers: Alum, Ferric sulfate.

A pilot filter apparatus uses a coarse to fine mixed bed or dual bed filter media and continuously monitors and compares the turbidity of chemically treated water passing through a point intermediate the length of the bed with the turbidity of water passing from the filter as final effluent. The clarification chemicals recommended are alum, ferric sulfate, or organic polymers. (Sinha-OEIS)
W73-10586

REMOVAL OF MERCURY FROM LIQUIDS USING KERATIN DERIVATIVES,
Department of Agriculture, Washington, D.C. (assignee).
M. Friedman.
U. S. Patent No. 3,725,261, 3 p, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 313, April 3, 1973.

Descriptors: *Patents, *Waste water treatment, *Mercury, *Metals, Chemical reactions, Water quality control, Pollution abatement, Water pollution control.
Identifiers: *Keratin, Chemical treatment.

Water containing mercury is treated with a keratin derivative. The keratin derivative acts as an absorbent and the mercury becomes bound to the keratin. Three examples are cited. Suspended particles of elemental mercury may be removed by physical entrapment. In the keratin treatment the reaction is conducted at room temperature but the reaction may be speeded up by increasing the temperature. It is preferred that atmospheric oxygen be excluded from the reaction system. The exclusion is attained by sweeping a non-oxidizing gas such as nitrogen or helium through the system. (Sinha-OEIS)
W73-10587

PROCESS FOR RECOVERY OF MINERAL POLLUTANTS FROM ACIDIC WASTE STREAMS,
Aerojet-General Corp., El Monte, Calif. (assignee).
D. O. DePree.
U. S. Patent No. 3,725,259, 5 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 313, April 3, 1973.

Descriptors: *Patents, *Acid mine water, Streams, Lakes, Rivers, *Waste water treatment, *Industrial wastes, Pollution abatement, *Metals.
Identifiers: *Metal salts removal, Pickling plants, Electroplating baths.

LIBRARY U. OF I., URBANA-CHAMPAIGN

The acidic waste stream is led to the weak acid cation exchange bed in a countercurrent pass. The cation exchange resin in the bed removes the metals from the stream. The stream then moves on to a neutralization zone. Lime or calcium carbonate is introduced into the neutralization zone. The purified water is led away for disposal. The spent resin is moved to a regeneration zone where it is treated with a ligand or chelating solution. Twelve examples are cited. (Sinha-OEIS)
W73-10588

APPARATUS FOR CLEANING SEWAGE WATER,
Adaks Products Inc., (assignee).
H. K. Heen.
U. S. Patent No. 3,725,205, 6 p, 2 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 301, April 3, 1973.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Evaporators, *Condensation, Equipment, Water quality control, *Distillation, Pollution abatement.

Sewage water is fed to a surge tank, and from there, periodically and in predetermined quantities, through a batching valve to a sealed evaporator tank, which is surrounded adjacent its lower end by a condensing chamber. When the level of the liquid in the evaporator drops to a predetermined low limit, sensing means opens the batching valve momentarily to fill the tank, thereby starting a vacuum pump which reduces the pressure in the tank and chamber approximately to the saturated vapor pressure in the tank. A vapor fan then pumps vapor from the tank to the chamber, where the vapor condenses and transfers heat to the remaining sewage water in the tank. Periodically the slurry in the tank is automatically discharged and incinerated. (Sinha-OEIS)

PROCESS FOR REMOVAL OF AMMONIA FROM WASTE WATER STREAMS,
D. W. Breck.
U. S. Patent No. 3,723,308, 7 p, 1 fig, 9 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 1116, March 27, 1973.

Descriptors: *Patents, *Ammonia, *Municipal wastes, *Agricultural runoff, *Industrial wastes, Ion exchange, *Waste water treatment, Pollution abatement, Water quality control, *Zeolites.

Ammonium ions are removed from aqueous solutions containing one or more alkali or alkaline earth cations by effecting the removal with Zeolite F, a synthetic crystalline aluminosilicate having a silica to alumina oxide mol ratio of about 2 and having been derived from a potassium-rich reaction mixture. (Sinha-OEIS)
W73-10594

APPARATUS FOR TREATING WASTE WATER,
Pollutrol Industries, Inc., Portland, Maine. (assignee).
K. L. Rost.
U. S. Patent No. 3,721,344, 5 p, 4 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 908, No 3, p 625, March 20, 1973.

Descriptors: *Patents, *Waste water treatment, Equipment, *Aeration, *Pollution abatement, Water pollution control, Water quality control, Settling basins.
Identifiers: *Settling chambers.

This apparatus consists of two chambers, the first for the reception of waste water and the second which functions as a settling chamber. Each chamber has a device for aeration. The second chamber has a discharge provided with an overflow inlet and an expansion chamber extending downward into it. Means are provided to deliver air into the expansion chamber to force water out of it thus to raise the second chamber level to cause an overflow through the discharge, the overflow being relatively clear after a predetermined settling interval. SURFACTANTS IN SEWAGE AND THEIR POSSIBLE REMOVAL, (IN ITALIAN),
Stazione Sperimentale degli Olii e dei Grassi, Milan (Italy).
A. Arpino, G. Mariani, and N. Quarenghi.
Riv Ital Sostanze Grasse. Vol 49, No 3, p 121-127, 1972. Illus. English summary.
Identifiers: *Sewage, *Surfactants, Waste water treatment, Treatment facilities.

An experimental study to remove surfactants from sewage is presented together with a treatment plant scheme. The described procedure is essentially based on the physical principle of blowing in air and removing the foam produced; the plant is completed by a foam combustion zone. By comparing the initial data with those obtained after some years of operation, and considering the occurrence of various types of surfactants in waters treated, an average qualitative yield of about 91% is expected. Results obtained may be considered satisfactory, considering that naphtha consumption, even though not a minor factor, represents practically the sole element of plant operation cost.--Copyright 1973, Biological Abstracts, Inc.

EFFECTIVE MIXING IN SHALLOW BODIES OF WATER WITH AND WITHOUT DENSITY STRATIFICATION,
Utah State Univ., Logan.
K. A. Mangelson, and G. Z. Watters.
Paper presented at the 19th Annual Specialty Conference, Hydraulics Div., American Society of Civil Engineers, Iowa City, Iowa. August 1971. 27 p, 18 fig. OWRR A-008 Utah (2). 14-31-0001-3545.

Descriptors: *Dispersion, Hydraulics, *Time of concentration, *Tracers, Baffles, Hydraulic models, *Oxidation lagoons, Waste water treatment, Treatment facilities, *Mixing, *Density stratification.

Very little attention has been given to the hydraulics characteristics of waste stabilization ponds in the past. From physical observations of the Logan City waste stabilization ponds as well as from distorted model studies of these ponds, this study has demonstrated the hydraulic characteristics of shallow bodies of water under several different conditions of inflow, outflow and design of the pond, and the effects of mixing within the body on the resulting age distribution of tracer elements. While a complete description of the dispersion process is not given, a practical description, by parameters which describe the degree of mixing is used to measure the performance of the ponds. (Jeppson-Utah)

THE FEASIBILITY OF FLOW SMOOTHING STATIONS IN MUNICIPAL SEWAGE SYSTEMS,
Research Triangle Inst., Durham, N.C.
C. N. Click.
Copy available from GPO Sup Doc as EP1.23/2: 73-138, $1.25; microfiche from NTIS as PB-221 246, $0.95. NTIS paper copy $3.25. Environmental Protection Agency, Technology Series Report EPA-R2-73-138. February 1973. 94 p, 17 fig, 2 tab, 21 ref. EPA Project 11010 FDI. Contract 14-12-935.

Descriptors: *Surge tanks, *Sewers, *Economic feasibility, *Domestic wastes, Waste water (Pollution), Municipal wastes, Sewage, Sanitary engineering, Water pollution control, Feasibility studies, *Cost comparisons, Estimated benefits, *Design criteria, *Hydraulic conduits, Sewerage, Waste water treatment.
Identifiers: *Flow smoothing, Flow Equalization.

Flow smoothing in sanitary sewers was studied to determine under what conditions the resulting higher flow capacities can be economically obtained. Conservative assumptions were made in this preliminary design and economics study to provide a severe test for the cost effectiveness of the concept. In many situations, flow smoothing is an attractive alternative when compared to relief pipe installation. Circumstances which favor flow smoothing are high interest rates, high peak-to-average flow rations, low pipe slopes, small diameters, and low design depths of flow. Flow smoothing is strongly favored where earthen construction can be utilized. (Bostian-EPA)

APPLICATION OF SELECTED INDUSTRIAL ENGINEERING TECHNIQUES TO WASTE WATER TREATMENT PLANTS,
Hittman Associates, Inc., Columbia, Md.
R. Waller, and C. W. Mallory.
Copy available from GPO Sup Doc as EP1.23/2: 73-176, $2.60; microfiche from NTIS as PB-221 144, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-73-176. February 1973, p 226, 19 fig, 13 ref. EPA Project 17090 FYZ. EPA Contract 14-12-946.

Descriptors: *Water Quality Control, Waste water treatment, *Operation and maintenance, Reliability, Personnel management, *Michigan, *Treatment facilities.
Identifiers: *Flint (Mich), *Industrial Engineering techniques.

The applicability of various industrial engineering techniques to operation and maintenance of secondary waste treatment plants was evaluated. Numerous techniques used in military and industrial projects were evaluated and applied in a case study at the Flint, Michigan, waste treatment plant using actual plant data, practices, and procedures. Emphasis was placed on Work Study and Reliability and Maintainability analysis. A variety of techniques were directly and beneficially applicable to the development of rational management programs for design, operation, maintenance, staffing, and quality control. An overall approach

o develop complete management programs was developed whereby designers or managers could start from effluent goals and rationally develop designs, O and M procedures, and staffing levels as well as increase plant reliability. Quality control programs are hampered by: poor parameters for measuring effluent quality and process control; lack of knowledge of causes of variability of plant effluent quality as well as the nonsteady state effects of equipment failures; the prevailing practices for setting quality goals, collecting and evaluating performance data; and current practices for enforcement of performance requirements by regulatory agencies. A number of recommendations were offered to develop programs for upgrading waste water plant management. (EPA)

DEWATERING OF MINE DRAINAGE SLUDGE PHASE II,
West Virginia Univ., Morgantown,
D. J. Akers, Jr., and E. A. Moss.
Copy available from GPO Sup Doc as EP1.23/2: 3-169, $2.10; microfiche from NTIS as PB-221 45, $0.95. Environmental Protection Agency Technology Series Report EPA-R2-73-169, February 1973. 152 p, 30 fig, 43 tab, 18 ref. EPA Project 14010 FJX.

Descriptors: *Acid mine water, *Neutralization, Sludge treatment, Freezing, *Flocculation, Centrifugation, *Dewatering, *Waste water treatment, Filtration, Filters, Drying, *Mine drainage.
Identifiers: Filter aids, Vacuum filtration, Pressure filtration, Porous bed filtration.

A study of various acid mine drainage sludge conditioning methods and dewatering systems was made. Acid mine drainage and sludge from neutralization plants were characterized. Four sludges were selected as being representative of the various types of sludges produced by the lime/limestone neutralization of acid mine drainage. The conditioning methods studied were: freezing, use of flocculants, and use of filter aids. The six dewatering systems evaluated were: (1) conventional rotary vacuum filtration, (2) rotary precoat vacuum filtration, (3) pressure filtration, (4) porous bed filtration, (5) thermal spray drying, and (6) centrifugation. No single dewatering system was best for all acid mine drainage sludges. On the basis of cost, the most promising acid mine drainage sludge dewatering techniques appear to be centrifugation, rotary vacuum filtration and rotary precoat vacuum filtration. Descriptors: *Water pollution control, *Waste water treatment, *Aerobic treatment, *Surveys, Design criteria, Treatment facilities, Waste water treatment, Oxygen, Temperature, *Sludge digestion, Waste disposal.
Identifiers: Digester capacity.

Presented is a survey of aerobic digesters used to stabilize waste sludges from seven water pollution control plants in the Province of Ontario, conducted over an eighteen month period. Air flow rates of 20 cfm/1000 cu. ft. of digester capacity were inadequate for both mixing and oxygen requirements in certain installations. Air flow rates determined on the basis of sludge age and solids concentrations indicate that rates of approximately 50 cfm/1000 cu. ft. of digester capacity are required. To produce a stable sludge, a total sludge age in excess of 120 days is required. To effect sludge concentration and to provide the necessary sludge age, a two stage digester should be provided for all plants except the extended aeration modification of the activated sludge process. The reduction of volatile solids is not a practical indicator of digested sludge stability. Digesting sludge stability is best indicated by the specific oxygen uptake rate; this rate is temperature dependent. Operational problems can result from temperature extremes in the digester; however, temperature variations can be minimized by the physical design of the plant. A substantial literature review, field study procedures, a description of treatment facilities, and a discussion of the results are included. (Bell-Cornell)

EFFECT OF A GRASS AND SOIL FILTER ON TUCSON URBAN RUNOFF: A PRELIMINARY EVALUATION,
Arizona Water Resources Research Center, Tucson.
B. P. Popkin.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 235-261, (1972). 16 fig, 1 tab, 21 ref. OWRR B-023-ARIZ (1).

Descriptors: *Grasses, *Soils, *Urban runoff, *Water quality control, *Treatment, Storm runoff, Lysimeters, Loam, Water sampling, Inorganic compounds, Chemical oxygen demand, Coliforms, Turbidity, Sediments, Leaching, Watershed management, Arizona, Arid lands.

Because storm runoff from the Tucson metropolitan area requires processing for most uses, a grass and soil filter lysimeter was constructed and evaluated as a water-quality treatment facility. The 200x4x5 foot lysimeter contains homogeneous calcareous loam covered by common grasses. Less than a cubic foot per second of storm runoff flows by gravity over the lysimeter where surface inflow, surface outflow and subsurface outflow are measured and sampled. Four discrete trials were conducted in the fall of 1971, where water samples were analyzed for inorganic chemical constituents, chemical oxygen demand (COD), coliforms, turbidity and sediment. Concentrations of COD, coliforms, turbidity and sediment in subsurface-outflow samples decreased significantly during each trial, though early trials showed extensive leaching. Surface-outflow samples had lower turbidity, COD, coliforms and sediment than inflow samples. Turbidity, suspended and volatile solids, coliforms, and COD in runoff samples may be reduced by grass and soil filtration. Grass development and soil settling work to produce a better quality outflow. Quantification of the lysimeter's effectiveness will be useful for urban watershed management in arid lands. NITROGEN SPECIES TRANSFORMATIONS OF SEWAGE EFFLUENT RELEASES IN A DESERT STREAM CHANNEL,
Arizona Water Resources Research Center, Tucson.
P. G. Sebenik, C. B. Cluff, and K. J. DeCook.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 263-275, (1972). 5 fig, 1 tab, 7 ref. OWRR A-022-ARIZ (5).

Descriptors: *Nitrogen cycle, *Sewage effluents, *Ephemeral streams, *Arid lands, *Water pollution, Effluent, Streams, Surface waters, Sewage treatment, Irrigation water, Water sampling, Daily hydrographs, Nitrification, Stream stablization, Rates, Groundwater recharge, Surface-groundwater relationships, *Arizona.

Treated sewage effluent is sometimes utilized as a source of irrigation water. This study was made to examine nitrogen species transformations of effluent releases in the channel of an ephemeral stream in southern Arizona. Water samples were taken at locations in sequence so that peak daily flows could be traced as effluent moved downstream. Increased nitrification, coinciding with changing stream characteristics, starts at 6.3 river miles from the Tucson Sewage Treatment Plant discharge. Nitrate-nitrogen values reach a maximum at about 90-95 percent and 60-80 percent of total flow distance for low flows and high flows respectively. Thr rate of nitrification within sewage effluent releases in a desert stream channel is related to flow distance and physical characteristics of the stream. Once nitrogen loss mechanisms are known, it may be economically feasible to manage the sewage effluent regime to stimulate increased nitrogen loss, thereby reducing the nitrate-nitrogen concentrations in groundwater recharge. EVALUATION OF A TURFGRASS-SOIL SYSTEM TO UTILIZE AND PURIFY MUNICIPAL WASTE WATER,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
R. C. Sidle, and G. V. Johnson.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 277-289, (1972). 1 tab, 12 ref. OWRR A-025-ARIZ (3).

Descriptors: *Turf grasses, *Soil chemical properties, *Waste water treatment, *Sewage effluent, *Nitrogen cycle, Water quality, Water treatment, Irrigation water, Silts, Loam, Soil moisture, Water pollution, Arizona.

Sewage effluent for irrigation is well established. This study determines the capacity of selective turfgrass-soil systems to purify municipal sewage effluent and to measure the degree of utilization of nitrogen in the effluent by turfgrass. Chlorinated secondarily treated sewage effluent from the city of Tucson was applied to turfgrass grown on sandy loam, silt and loam, under three levels of irrigation under laboratory conditions of duplicate pots. Each pot had 2 suction probes to estimate soil moisture tensions and to allow soil water sampling. The study operated from September to March, 1972, for 30 weeks. Purification efficiency, nitrogen utilization and percent recharge were calculated. Turfgrass can be irrigated with sewage effluent at common rates without hazard of nitrogen pollution to groundwater. Purification efficiency exceeded 90 percent for all irrigation levels on sandy loam and silt. Nitrogen utilization was greater over sandy loam. Turfgrass-soil systems can utilize nitrogen and purify waste water. (See also W73-10818) (Popkin-Arizona)

A STUDY OF CILIATE PROTOZOA FROM A SMALL POLLUTED STREAM IN EAST-CENTRAL ILLINOIS,
Maryland Univ., College Park. Dept. of Zoology.

E. B. Small.
American Zoology, Vol 13, p 225-230, 1973. 2 fig, 2 tab, 3 ref. OWRR A-024 (7)B-028-ILL (5). 14-01-0001-1081, 14-01-0001-1898.

Descriptors: Waste water treatment, *Protozoa, Biodegradation, *Illinois, *Sewage, *Trickling filters, Filtration, Bacteria, Sessile algae.
Identifiers: *Peritrichs.

The role of species of ciliate Protozoa in trickling filter waste treatment processes awaits redefinition. Using the small fresh-water Salt Fork stream a stream which receives all of the discharge from the Champaign-Urbana Waste Treatment Plant in east-central Illinois, analyses of samples of carefully identified ciliates taken from selected sites over a three-year period yielded some interesting results. Four specific situations were noted: (1) free-swimming microphagous forms feeding selectively on primarily attached bacteria, and, in turn, being fed on by carnivorous ciliates; (2) sessile ciliates (peritrichs) feeding on non-attached bacterial species, but with high selectivity; (3) free-swimming carnivorous gymnostomes feeding on the sessile peritrichs but, again in turn, serving as prey themselves to stalked suctorian species attached to the peduncles of the peritrichs; (4) attached peritrichs and suctorians both serving as food for several groups of small invertebrates frequenting the stream. With respect to numbers and diversity of ciliates found, some 155 different species, belonging to 93 genera, were identified in the stream and/or the trickling filter settling basin. The highest populations and greatest diveristy were found at sites closest to the waste water influx; such protozoan populations might thus be considered as a form of teritary treatment in the drainage basin.

BIOLOGICAL CONDITIONING FOR IMPROVED SLUDGE FILTERABILITY,
Arkansas Univ., Fayetteville. Dept. of Civil Engineering.
D. G. Parker, C. W. Randall, and P. H. King.
Journal Water Pollution Control Federation, Vol 44, No 11, p 2066-2077, November 1972. 13 fig, 18 ref. OWRR A-035-VA (8).

Descriptors: *Activated sludge, *Aeration, Chlorination, *Sludge treatment, Storage, Suspended solids, *Waste water treatment, *Filtration.
Identifiers: Filterability (Sludge), Biological conditioning (Sludge).

The effect of commonly used sludge handling procedures and sludge properties on the filterability of activated sludge were studied by using time required to collect 75 ml of filtrate from a 100-ml sludge sample under uniform conditions as a filtration index. Increase of suspended solids concentration in sludge decreased its filterability, as did anaerobic storage and chlorination. However, mild aeration at rates sufficient to supply excess dissolved oxygen improved filterability to a maximum at 4 to 6 days of aeration, after which filterability decreased to near its initial value by 2 wk of aeration. Stressing the sludge to the extent that organic carbon was released apparently decreased filterability, whereas biologically active sludge benefited from the aeration. The mechanism of filterability improvement through aeration thus appears to be biologically induced flocculation.

CLOSING THE LOOP ON WASTE WATERS.

Environmental Science and Technology, Vol 6, No 8, p 692-693, 1972. 1 fig.

Descriptors: *Industrial wastes, *Ion exchange, *Fertilizers, *Waste water treatment, Tennessee, Industries, Nitrogen, Ammonia, Resins, North Carolina, Water pollution control, Recycling, Pollution abatement.
Identifiers: Fertilizer industry.

Waste water effluents from fertilizer-producing plants is coming under more strict regulatory control, largely because of release of pollutants into waterways. Ion exchange is moving to the forefront as one of the technologies available to handle wastes from actual producing plants. Essential steps in the ion exchange process are: collecting of plant waste waters, including runoff, in large settling ponds; filtering through anthracite coal filters to remove particulate matter; contacting waste water with strong acid cation exchange resin that removes the ammonium cation contaminant to less than 3 ppm; contacting the 'decationated' water with a weak base resin in the hydroxide form that removes the anion contaminant to 7-11 ppm nitrate; regenerating cation resin with 22% nitric acid; regenerating anion resin with 7% ammonium hydroxide; combining backwash from each separate unit and neutralizing excess acid with ammonia. Farmers Chemical Association, Inc. calculates that with the ion exchange closed loop system it would produce more than an additional 6000 tons of ammonium nitrate annually. Certainly, FCAI is the first in the industry to have licked a pollution problem that all ammonium nitrate producers share. (Jones-Wisconsin)

ENTERIC VIRUS SURVIVAL IN ALGAL-BACTERIAL WASTEWATER TREATMENT SYSTEMS-I. LABORATORY STUDIES,
California Univ., Berkeley. School of Public Health.
M. D. Sobsey, and R. C. Cooper.
Water Research, Vol 7, No 5, p 669-685, May 1973. 8 fig, 7 tab, 21 ref.

Descriptors: *Waste water treatment, *Oxidation lagoons, *Biological treatment, Laboratory tests, Bioassay, Sewage effluents, Waste water (Pollution), Cultures, Algae, Bacteria, Suspended solids.
Identifiers: *Enterovirus, *Survival, *Scenedesmus quadricauda, *Bacillus megaterium, *Inactivation, Data interpretation, Heterotrophy, Poliovirus, Culture media.

The survival of a representative enteric virus, poliovirus type 1, in laboratory models of algal-bacterial sewage treatment systems and the interactions of poliovirus with stabilization pond water was studied. In laboratory reactors a fraction of the total poliovirus present rapidly adsorbed to stabilization pond water solids by a reversible process, conforming to a Freundlich adsorption isotherm. In laboratory cultures the growth of Scenedesmus quadricauda and Bacillus megaterium in sterile sewage had no detrimental effect on poliovirus survival, whereas the growth of heterogeneous populations of stabilization pond bacteria in the same medium resulted in substantial virus inactivation. Appreciable poliovirus inactivation occurred in laboratory cultures of mixed algal-bacterial populations obtained from stabilization ponds. Because the degree of antiviral activity in these cultures was greater than that in cultures of stabilization pond bacterial alone, additional microbial factors must contribute to this virus inactivating phenomenon. The results suggest that in algal-bacterial treatment systems both virus adsorption to solids and virus inactivation due to microbial activity play a role in reducing the enteric virus concentration in wastewater. APPARATUS FOR MONITORING AND CONTROLLING HALOGEN LEVELS IN A WATER TREATMENT SYSTEM,
Halogen Controls, Inc., Barrington, Ill. (assignee).
D. P. DeVale.
U. S. Patent No. 3,724,474, 5 p, 4 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 132, April 3, 1973.

Descriptors: *Patents, *Water supply, *Water treatment, Water quality control, *Halogens, Pollution abatement, Water pollution control, Chemical reactions, Waste water treatment.
Identifiers: *Chemical treatment.

An improved method and apparatus are described for measuring and controlling the halogen content of water. A pair of electrodes are placed in the water undergoing treatment. A capacitor is connected across the electrodes. A high input impedance detection circuit is used to determine when the voltage across the capacitor has decreased to a predetermined level and chlorine is added to the predetermined level. The halogen (chlorine usually) content is detected on a continuous fluid flow, dynamically sensed basis. (Sinha-OEIS)

MACHINE FOR REMOVING SEDIMENTARY MATERIAL FROM FILTER BEDS,
Gewerkschaft Eisenhuette (West Germany). (assignee)
H. Wegmann, K. U. Smula, L. Bartz, and W. Stoltefuss.
U. S. Patent No 3,720,299, 5 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 908, No 2, p 357, March 13, 1973.

Descriptors: *Patents, *Filtration, Water supply, *Sediments, Rivers, Water quality control, Water pollution control, *Water treatment, Water purification, Pollution abatement, *Skimming, *Waste water treatment.

The machine comprises a chassis, means for moving it, and means for skimming an upper layer of material as the chassis moves, and a means for conveying the material from the skimmer. The machine is run on endless tracks. It supports a displaceable front frame carrying an inclined conveyor holding circulated buckets. A rotatable drum with projecting paddles or bars projects material in a trough which feeds the buckets. An inclined plate skims a layer of material from the bed as the machine advances and the drum picks up the material from the plate. Another conveyor extends transversally of the chassis and receives material from the inclined conveyor for subsequent discharge from the machine. (Sinha-OEIS)

WATER-SOFTENING UNIT,
National Waterpure Corp., Fallsington, Pa. (assignee)

S. Borochaner.
U. S. Patent No 3,719,594, 3 p, 1 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 908, No 1, p 172, March 6, 1973.

Descriptors: *Patents, *Water treatment, *Water softening, Water quality control, *Demineralization, *Ion exchange, Resins.
Identifiers: *Regeneration chambers.

This water softening unit comprises a housing having an ion exchange chamber and a regeneration chamber. The first chamber contains the ion exchange resin for softening water. The regeneration chamber is adapted to selectively contain regeneration material for regenerating the resin as necessary. A conduit extends from the top of the ion exchange chamber and is connected by coupling to a spicket positioned outside the housing. A second conduit leads from the bottom of the chamber upward into the regeneration chamber. An important feature of this sytem is the mounting of the regeneration chamber above the ion exchange chamber and the spicket. This permits the water to flow by simple gravity operation. (Sinha-OEIS)
W73-10604

WATER PURIFYING DEVICE,
J. Astil.
U. S. Patent No 3,719,593, 5 p, 4 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 908, No 1, p 172, March 6, 1973.

Descriptors: *Patents, *Reverse osmosis, *Water purification, Water quality control, *Waste water treatment, *Water treatment.

A reverse osmosis device is used to process feed water under line pressure. The purified water is accumulated in a compressible container and is then led to an outlet. The use of the feed water causes an increased feed water flow through the reverse osmosis device flushing it out. A bleed drain drains off the feed water that is then used to compress the compressible container returning the system to the water purifying and storage condition after delivery of the product water. (Sinha-OEIS)
W73-10605

FILTRATION PROCESS FOR CLARIFICATION,
Erbara-Infilco Ltd., Tokyo (Japan). (Assignee)
Y. Hayashi, and A. Obara.
U. S. Patent No 3,719,592, 4 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 908, No 1, p 171, March 6, 1973.

Descriptors: *Patents, *Filtration, *Coagulation, *Water treatment, *Sedimentation, Turbidity, Waste water treatment.
Identifiers: Aluminum sulfate, *Clarification (Water).

The filtration process consists of adding about 3 - 5 ppm aluminum sulfate to suspended water having a turbidity of less than 100 ppm at a time not more than 1 minute before the suspended water is applied to a filter. The rate of filtration is 10 - 40 m/hr and during the filtering an additional quantity of aluminum sulfate is added until the filtered water is stabilized. (Sinha-OEIS)
W73-10606

CONCENTRATION OF VIRUS FROM WATER BY ELECTRO-OSMOSIS AND FORCED-FLOW ELECTROPHORESIS: II. IMPROVEMENT OF METHODOLOGY AND APPLICATION TO TAP WATER,
Gulf South Research Inst., New Orleans, La. Public Health Science Div.
R. D. Ellender, F. Morton, J. Wheland, and B. H. Sweet.
Prep Biochem. Vol 2, No 3, p 215-228. 1972. Illus.
Identifiers: *Electro osmosis, *Electrophoresis, Flow, Methodology, Osmosis, *Virus, *Potable water, Water treatment.

The ability of the Canalco Model CF-3 electro-osmosis (EO) apparatus to concentrate viruses from artifically seeded distilled water was improved. Modification of the physical arrangement of the equipment allowed for a 10-25 fold increase in concentration efficiency and a concomitant decrease in the process time. The major improvements involved modifications of the cell arrangement (which increased the membrane transport area), a change in the salt replenishing solution and the use of different membranes of higher flux. Viruses concentrated by EO from seeded tap water resulted in lower recoveries when compared to distilled water. The lower yields were probably due to instability or aggregation of the agents in the menstruum. One could detect viruses at levels as low as 0.01 plaque forming units/ml of initial input. The efficacy of a modification of the Canalco forced flow electrophoretic system was also evaluated. The maximum potential was applied with a constant value for pump rates. A 6-fold concentration of virus and a 12-fold decrease in water volume was obtained. The technique may be applied to the determination of viral flora of natural, processed and recreational waters. EFFECTS OF MOSQUITO CONTROL DITCHING ON ESTUARINE ECOSYSTEMS,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
E. J. Kuenzler, and H. L. Marshall.
Available from the National Technical Information Service as PB-220 951, $3.00 in paper copy, $0.95 in microfiche. North Carolina University Water Resources Research Institute Report No 81, February 1973. 83 p, 15 fig, 14 tab, 49 ref, append. OWRR B-026-NC (1). 14-31-0001-3315.

Descriptors: Environmental effects, Ecology, *Estuarine environment, *Drainage, Mosquitoes, *Ditches, *North Carolina, *Salt marshes, Wetlands, Marsh management.
Identifiers: *Mosquito Control, Estuarine ecosystems.

Large areas of irregularly flooded North Carolina salt marsh dominated by Juncus roemerianus have been ditched in an attempt to control mosquito breeding. Comparative study of ditched and unditched marshes at three locations in N.C. was carried out to determine the extent of ecological changes. Ditches increase the area of aquatic habitat in marshes by a factor of 5, are inhabited bylarge numbers of juvenile fishes, crabs, and shrimp and increase the amount of nursery ground for fish and crustaceans. Animal variety in ditches is low. Oysters planted in the ditches did not grow well. It is unlikely that oysters or shrimp could be cultured successfully on a commercial basis in ditches. Marshes were flooded 10-28% of the time. Fiddler crabs were present on all marshes. During flood tides fishes occur on both ditched and unditched marshes. Except for the direct effects of the spoil piled on top of the marsh during ditching, large changes were evident in the density and growth of Juncus. Brushy vegetation invaded many spoil piles and along ditches. Invasion continued druing the two year study. Failure of vegetation to significantly cover many spoil piles after eight years, and continuing erosion of spoil piles to form water-retaining levees along ditches is cause for concern. Moratorium on ditching is recommended pending further research on effectiveness for mosquito control and ecological effects.

PUBLIC PARTICIPATION IN WILLAMETTE VALLEY ENVIRONMENTAL DECISIONS,
Oregon State Univ., Corvallis. Dept. of Anthropology.
C. L. Smith.
Available from the National Technical Information Service as PB220 953, $3.00 in paper copy, $0.95 in microfiche. Oregon Water Resources Research Institute Report WRRI-15, April 1973. 148 p, 8 fig, 18 tab, 81 ref. OWRR B-023-ORE (2).

Descriptors: *Decision making, Environmental effects, Water pollution control, Social values, *Oregon, Attitudes, *Water quality.
Identifiers: *Willamette River (Ore), *Public participation, Interest groups, Lobbying.

In the summer of 1969 the water quality of the Willamette River reached a level suitable for most human and wildlife uses for the first time in nearly 60 years. This water quality enhancement program had been undertaken 30 years earlier when those closely associated with the river were successful in arousing public interest in the deteriorated quality of the river. These two events in the Willamette Valley were not attributable to the urban oriented environmentalists. They were the result of over 30 years of deliberation, debate, and decisions worked out in accordance with the broad variety of self-interests which prevailed among Willamette Valley citizens. Self-interest, energized by emotional commitment, was a critical element as groups argued one side or the other of such dilemmas as growth and no growth, management of the environment by man an management by nature, diversity and similarity of actions, elitism and broad participation in decision-making, centralization and decentralization of authority, and generalization and specialization of interests.

INFLUENCE OF WATER QUALITY IN MAINTAINING WHITENESS WHEN LAUNDERING WHITE FABRICS,
North Dakota Univ., Grand Forks. Dept. of Textiles and Clothing.
C. M. Janecek.
Available from the National Technical Information Service as PB-220 968, $3.00 in paper copy, $0.95 in microfiche. North Dakota Water Resources Research Institute, Fargo, Report WI-221-015, September 1971. 12 p. OWRR A-020-NDAK (3).

Descriptors: *Laundering, *Textiles, *Fabrics, *Testing, Water quality, Effects, Testing procedures, Cotton, Water types, Hardness (Water), Color, Water properties, Water analysis, Organic matter, Water pollution effects, Water softening.
Identifiers: Fabric whiteness.

The first phase of this study considered how hardness, iron, and manganese affected white cotton test fabric in the laundry process. The second phase was concerned with the effects of organic coloring and minerals on the test fabric. Swatches were prepared from the fabric and laundered by cooperators. The swatches were analyzed in the textile laboratory before laundering and after 1, 5, 10, 15, and 20 launderings. Fabric discoloration and changes in physical properties were considered. Hot and cold water samples were analyzed from each water system. The results of phase one indicated that: there was not a seasonal change in the waters sampled; water conditioning equipment was not functioning properly in a number of cases; fabric laundered in hard waters containing iron and manganese became discolored during the first laundering and the discoloration increased with repeated launderings; and that tensile strength decreased for fabrics laundered in very hard water. In phase two white cotton test fabric was laundered in waters containing organic coloring and minerals, then compared to the same kind of fabric laundered in clear, softened water. Statistically, discoloration was significant, but there was no significant difference in strength loss for the fabrics laundered in the organically colored water. (Woodard-USGS)

OILY WATER SEPARATION SYSTEM,
Esso Research and Engineering Co., Florham Park, N.J.
R. J. Skocypec.
Available from the National Technical Information Service as COM-72-10561, $4.50 in paper copy, $0.95 in microfiche. Final Report No. EE2TMR.72, January 1972. 54 p, 18 fig, 20 tab, 2 append. Project No. Task II, Sub-Task 3. Contract No. C-1-35049.

Descriptors: *Oily water, *Separation techniques, *Filtration, Oil, Oil wastes, Water pollution control.
Identifiers: *Ballast water, Performance evaluation, Esso coalescer, Cuno filter, Oil removal, Particulate matter.

An oily water separation system for marine use consisting of an AMF-Cuno Super Auto-Klean Filter (Model AK-511) upstream of an Esso Coalescer was evaluated. The Cuno-Filter was evaluated as a unit for particulate removal while the Esso Coalescer was evaluated as an oil removal device. The system's effectiveness was highly inconsistent due to plugging of the coalescer by wax. The best performances achieved were with two coalescers in series downstream of a surge tank for gross oil removal. Oil removal efficiencies were near 90 percent for these tests over a wide range of influent oil contents. The Cuno-Filter was unsuccessful in removing particulates in this application. However, it should be noted that the Cuno filter was not specifically designed for this application. General application of this type of coalescer where a highly polished effluent is desired is discouraged for dirty ballast water treating because of wax plugging which makes the coalescer inoperative. The coalescer is, however, recommended for removing oils with known low wax contents. Plugging due to suspended solids is not thought to be significant. (Little-Battelle)

INTERNATIONAL ENVIRONMENTAL CONTROLS IN THE SCIENTIFIC AGE,
Columbia Univ., New York. Inst. for the Study of Science in Human Affairs.
Z. Slouka.
In: Law, Institutions, and the Global Environment. Oceana Publications, Inc., Dobbs Ferry, New York. p 208-236. 1972. 56 ref.

Descriptors: *Environmental control, *International law, *Management, Technology, *Research, Data collections, Data transmission, Economics.

The roles of science and technology in international environmental management are discussed. Efforts to create new global norms and institutions for environmental control by slow traditional means cannot be relied upon as primary mechanisms for environmental management unless they are accompanied by decisive international responses to environmental issues on regional and bilateral levels. The use of global institutions is compared to that of more fragmented systems, and collection and dissemination of data and economics are considered. Experience derived from international management of the oceans is reviewed. (Ensign-PAI)

Intergovernmental Maritime Consultative Organization, London (England). Legal Div.
T. A. Mensah.
In: Law, Institutions, and the Global Environment. Oceana Publications, Inc., Dobbs Ferry, New York. p 237-252. 1972. 8 ref.

Descriptors: *Oceans, *Water pollution control, *International law, Water pollution, Air pollution, Land management, Ships, Oil spills, Pollutants, Organizations, Legal aspects.

The activities of the Inter-Governmental Maritime Consultative Organization (IMCO) related to prevention of marine pollution are summarized. IMCO is concerned with contamination of the sea, land, and air by ships and other equipment operating in the marine environment, and it is particularly interested in preventing spills of oil and other noxious substances. The institutional and legal frameworks of the organization are described, and operative bodies within the organization are discussed, including the Maritime Safety and Legal committees. (Ensign-PAI)
W73-10568

THE POTENTIAL OF REGIONAL ORGANIZATIONS IN MANAGING MAN'S ENVIRONMENT,
Woodrow Wilson International Center for Scholars, Washington, D.C.
R. E. Stein.
In: Law, Institutions, and the Global Environment. Oceana Publications, Inc., Dobbs Ferry, New York. p 253-293. 1972. 143 ref.

Descriptors: *Environmental control, *International waters, *Governments, Inter-agency cooperation, Management, Organizations, International Joint Commission.
Identifiers: Regional-Global organizational relationships.

A description is given of the study, catalyst, and management functions of various intergovernmental organizations dealing with international environmental problems. The ways in which agencies deal with oil pollution of the oceans are explained along with the activities of the International Joint Commission. The relationship of regional organizations to global organizations is explored. (Ensign-PAI)
W73-10569

PROCEEDINGS OF THE 1971 OSTAC ANNUAL MEETING, STATE DEPARTMENT, WASHINGTON, D.C. 2-3 JUNE 1971.

National Security Industrial Association, Washington, D.C. 266 p, 1971.

Descriptors: *Environmental control, Programs, *Federal government, *State Governments, *Local governments, Natural resources, Protection, Mapping, Charts, Water pollution, Air pollution, Water quality, Pollution abatement, Coasts, Management, Ships, Operations, Industries, Fishing, Oil, Chemicals, Mining, Recreation.

Federal, state, and regional programs concerned with the marine environment were described at the 1971 annual meeting of the ocean science and Technology Advisory Committee. These include programs on ocean resource protection; mapping, charting, and geodesy; environmental prediction and atmospheric services; pollution prevention; air pollution; water quality; coastal zone management; and ship operations. In addition, the current status of the chemical, fishing, petroleum, marine recreation, and marine mining industries is discussed. (See W73-10571 thru W73-10578) (Ensign-PAI)
W73-10570

DEPARTMENT OF INTERIOR PROGRAM,
Bureau of Outdoor Recreation, Washington, D.C.
C. D. Hofe, Jr.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p II-28-II-35, 1971.

Descriptors: United States, *Federal government, *Coasts, *Estuaries, *Management, *Resources development, Programs, Wildlife, Fisheries, Regulations, Waste disposal, Dredging, Land fills, Recreation, Water quality, Circulation, Hydrology, Water pollution control, Mining, Exploitation, Oil, Operations.
Identifiers: *Department of Interior.

Coastal zone management and resource development programs of the Dept. of the Interior are discussed. The National Park Service administers 54 coastal zone areas, and the Bureau of Sport Fisheries and Wildlife conducts studies designed to improve anadromous fish populations. In addition, the Bureau operates fish hatcheries and has National Wildlife Refuges located in estuaries and on coastal islands. The Bureau also reviews applications for permits to dredge, fill and to discharge refuse in navigable waters. The Bureau of Outdoor Recreation is concerned with the development of coastal areas for recreation purposes, and the Geological Survey carries out research on water quality, circulation, hydrology, and pollution control. The Survey also maps continental margins and performs geologic and geophysical surveys. The Bureau of Land Management is concerned with the development of marine mineral resources, oil and gas leasing, and the environmental impact of mineral exploitation. The Bureau of Mines deals with offshore petroleum operations as well as dredging activities. (See also W73-10570) (Ensign-PAI)
W73-10571

FEDERAL INTERACTION WITH STATES,
Virginia Inst. of Marine Sciences, Gloucester Point.
W. J. Hargis, Jr.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p III-1 - III-10, 1971.

Descriptors: *Coasts, *Planning, *Management, Federal government, State governments, Local governments, *Governmental interrealtions, *Resources development, *Water quality, Zoning, Easements, Taxes, Permits, Licenses, Leases, Standards.

The development of a national coastal zone mangement program is proposed in order to preserve the quality of the oceans. Effective management of man's activities, ingress and egress, offloading and onloading, and transfer from international to interstate commerce would permit control of the resources and quality of the seas and coastal zones. A variety of complex management techniques should be used rather than a control model approach. Land planning and management, zoning, easements, tax relief, user permits, and dredging and filling licenses are suggested, along with fishery and mineral leasing, water uses and discharge permits, and water quality standards. There should be state and local involvement in the federal program, and all efforts should be coordinated. (See also W73-10570) (Ensign-PAI)
W73-10572

LONG ISLAND'S APPROACH TO ENVIRONMENTAL QUALITY,
Ocean Systems, Inc., Reston, Va.
E. C. Stephan.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p III-13 - III-17, 1971.

Descriptors: *Sounds, *Water quality control, Research, *Oceanography, Waste disposal, *Wetlands, *Management, Dredging, Landfill, Beaches, Stabilization, Standards, Industry, Agriculture, Waste water disposal, Waste water treatment, Technology, Thermal pollution, Ecology, *New York.
Identifiers: *Long Island.

Actions taken by the Nassau-Suffolk Regional Planning Board to preserve and enhance the quality of Long Island's marine environment are discussed. Oceanographic research has been carried out, along with studies on waste water disposal and groundwater replenishment; wetland management; dredging and dredge spoil placement; and beach stabilization and replenishment. Development of effluent standards for municipalities, industry, and agriculture is suggested, along with development of baselines to establish the extent of man's alteration of the environment and creation of sound waste water treatment and disposal technology. In addition, increased understanding of wetlands and their role in ecology and of thermal pollution from power plants is needed. (See also W73-10570) (Ensign-PAI)
W73-10573

DELAWARE MARINE RELATED STUDY,
Hercules, Inc., Wilmington, Del.
R. W. Cairns.
In: Proceedings 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p III-18 - III-24, 1971.

Descriptors: *Delaware, *Coasts, *Seawater, *Water quality control, Projects Development, Construction, Regulations, Permits, Legislation, Management, State govenments.
Identifiers: Public hearings, Prohibition measures.

Recommendations for ways to preserve and improve the quality of Delaware's marine and coastal environments are discussed. Environmental impact statements and public hearings on all major development projects in the coastal zone are suggested, along with prohibition of industrial development along the shoreline and building of deep water ports. In addition, a moratorium on permits for piers, docks, and structures that would intrude on the coastline is proposed, and more permanent coastal zone legislation is suggested. The possibility of centralizing management and responsibilities in the state is explored. (See also W73-10570) (Ensign-PAI)
W73-10574

THE GULF ENVIRONMENTAL PROGRAM,
Gulf Universities Research Corp., Galveston, Tex.
J. M. Sharp.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p III-25 - III-41, 1971.

Descriptors: *Gulf of Mexico, *Continental shelf, *Coasts, Research, Energy, Geochemistry, Trace elements, Oil, Pesticides, Organic matter, Chemical analysis, Sedimentation, Mineralogy, Biology, Synoptic analysis, Management, Economics, Water quality control.
Identifiers: *Barataria Bay, *Subsystem interrelations.

Environmental properties and processes, chief flows of energy mass, and momentums, and principal activities of man in five subsystems of the Gulf of Mexico are considered. These subsystems include coastal and continental shelf areas of the NE, N central, NW, and southern parts of the Gulf and the open Gulf which interconnects the four coastal/continental shelf subsystems. Direct interaction and interdependence of these subsystems is recognized. Synoptic investigations in Barataria Bay are described; these include geochemical, trace element, hydrocarbon, pesticide, and organic chemical analysis, along with determinations of mineral content, sediment texture and structure, and biology. Coastal zone management and economics are also considered. (See also W73-10570) (Ensign-PAI)
W73-10575

REPORT OF STUDY ON SHIPS CHANNELS AND HARBORS,
American Association of Port Authorities, Washington, D.C.
A. Hammon.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p III-49 - III-51, 1971.

Descriptors: *Atlantic Ocean, *Coasts, *Maine, *New Jersey, *Delaware, *Harbors, Facilities, Ships, Water pollution, Recreation, Cities, Pollution abatement, Cleaning, Protection.
Identifiers: Supertankers, *Port facilities.

Development of public, deepwater port facilities for supertankers carrying petroleum is discussed, with emphasis on the North Atlantic. Private supertanker terminal plans off northern Maine, and New Jersey, and in Delaware Bay have run into considerable local resistance because of the fear of oil pollution. The coastline is well developed for recreational and residential uses and also serves as a fishing ground. Supertanker transshipment terminals and vessels must offer the utmost in pollution prevention and oil containment and removal equipment, along with financial protection to surrounding shore communities. (See also W73-10570) (Ensign-PAI)
W73-10576

CALIFORNIA'S MARINE PROGRAM,
Modern Management, Beverly Hills, Calif.
J. J. Moore.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p III-53 - III-66, 1971.

Descriptors: *California, *Coasts, *Protection, *Management, *Legislation, Resources, Economics, Technology, Administration, Research and development, Water pollution control.

Coastal zone management programs undertaken in California are discussed, along with legislation for protecting California's marine and coastal environments. Economics of ocean resource development, demographic pressures within the coastal zone, environmental concerns, disenchantment with technology, and loss of confidence in administrative officials have encouraged legislation. Regional commissions for coastal zone management have been suggested, along with a moratorium on all coastal development until 1975. (See also W73-10570) (Ensign-PAI)
W73-10577

CHEMICAL PANEL REPORT,
Union Carbide Corp., New York.
J. S. Whitaker.
In: Proceedings, 1971 OSTAC Annual Meeting, National Security Industrial Association, Washington, D.C. p IV-9 - IV-16, 1971.

Descriptors: *Chemical industry, *Chemical wastes, *Waste disposal, Oceans, Land, Air, Hazards, *Water pollution control, Control systems, Protection, Equipment, Materials, Treatment facilities, Programs, Research and development, Transportation, Education.

Efforts made by the chemical industry to reduce the quality of its wastes and to make other wastes more acceptable to the receiving environment, particularly ocean and coastal areas, are discussed. The chemical industry needs the ocean

as a receptor for its toxic wastes which create greater hazards when disposed to land, air, or surface waters; however, the industry is opposed to indiscriminate dumping. The industry has changed raw materials, improved catalysts, changed starting and intermediate materials, altered equipment, and substituted one product for another. Terminal treatment with conventional hardware has also been employed. In addition to treating facilities, the industry has environmental protective research and development programs. An environmental hazard center which dispenses information on emergencies arising during transport and handling of chemicals is being established, and educational programs have been created. METHOD OF DECONTAMINATING AN ORGANOPHOSPHORUS INSECTICIDE,
Department of the Air Force, Washington, D.C.
B. C. Wolverton.
U. S. Patent No. 3,725, 269, 2 p, 2 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 315, April 3, 1973.

Descriptors: *Patents, *Insecticides, *Organophosphorus pesticides, Water pollution control, Water quality control, Chemical reactions, *Solvents, *Pollution abatement.

The method of decontaminating an organophosphorus insecticide comprises two steps. (1) Exposing the insecticide in a volume-to-volume ratio of ten parts of decontaminant to one part insecticide. The decontaminant being 12.5% - 25% by volume of monoethanolamine in dipropylene glycol monomethyl ether as a solvent. (2) The exposure is continued for at least 30 minutes. (Sinha-OEIS)
W73-10583

CONTROL OF OIL POLLUTION AT SEA, APPARATUS AND METHOD,
A. J. Ortiz.
U. S. Patent No. 3,724,662, 10 p, 12 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 178, April 3, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Leakage, *Seepage control, Oceans, Water quality control, Water pollution control, Equipment, *Pollution abatement.

The control of a leak or spill of oil is accomplished by the use of a huge plastic bag. The bag is of an inverted tear-drop shape with its small end serving as its mouth. The large end is closed except for hose connections for removal of accumulated oil to be transferred to a reservoir. Oil flows from the source into the bag and is pumped to the reservoir. The plastic bag is rolled from its pre-folded position and is pulled underwater by frogmen. Once the mouth has been positioned and anchored, the seal at the throat is released and oil is then allowed to flow into the body of the bag. (Sinha-OEIS)
W73-10591

FLOATING FIRE EXTINGUISHING APPARATUS AND CATCH BASIN,
R. J. Chiasson, R. G. Bourg, and T. J. Arceneaux.
U. S. Patent No. 3,724,555, 3 p, 4 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 151, April 3, 1973.

Descriptors: *Patents, *Oil pollution, *Oil spills, Equipment, *Pollution abatement, Water quality control, Water pollution control.
Identifiers: *Fire extinguishers, Oil rig fires.

A floating fire extinguishing apparatus and catch basin smother offshore oil rig fires and prevent oil pollution. The apparatus is a U-shaped hull which can be manipulated to enclose a burning rig and smother the fire. Pumps mounted on the structure spray water over the burning rig to assist in putting out the fire and cool the rig. Interconnected pressure relief vents are provided to relieve internal pressures. An annular space defined by the enclosing structure in the water provides a catch basin for the containment of the liquid hydrocarbon liquids. (Sinha-OEIS)
W73-10592

METHOD FOR SEPARATING OIL FROM WATER SURFACE,
Ocean Design Engineering Corp., Long Beach, Calif. (assignee).
R. E. Hunter.
U. S. Patent No. 3,723,307, 3 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 1115, March 27, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, Equipment, Water quality control, Water pollution control, *Pollution abatement.
Identifiers: *Wave action, Foam material.

Small buoyant bodies of flexible foam material are distributed over the oil floating on the surface of the water. The foam material is lifted and compressed to remove the oil and then returned to be used again. Booms are used for gathering the bodies of foam material toward a conveyor which lifts the material upward. The booms are articulated and include floats so that the booms rise and fall with wave action. (Sinha-OEIS)
W73-10595

APPARATUS FOR SKIMMING OIL,
Gulf Oil Corp., Pittsburgh, Pa. (assignee).
B. Stenstrom.
U. S. Patent No. 3,722,690, 4 p , 8 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 970, March 27, 1973.

Descriptors: *Patents, *Oil pollution, *Oil spills, Equipment, Water quality control, Water pollution control, *Pollution abatement, *Skimming.
Identifiers: *Oil skimmers.

This collapsible flotation buoy is intended for skimming an oil layer from water in a tanker so ballast water will not pollute ocean water. The buoy is provided with mechanical folding arms for collapsing the buoy, permitting its insertion into a narrow opening at the top of the tank. The folding arms are remotely controlled to permit expansion of the buoy for use when it is inside the tank. (Sinha-OEIS)
W73-10596

SEA-SURFACE OIL EXTRACTOR,
Reynolds Submarine Services Corp., Miami, Fla. (assignee).
R. F. Wirsching.
U. S. Patent No. 3,722,688, 4 p, 7 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 969, March 27, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Skimming, Equipment, Water quality control, Water pollution control, *Pollution abatement.
Identifiers: *Oil skimmers.

This oil skimmer carries its own ballast. A flexible skirt is used to form the wall of a sump compartment surrounding the ballast chamber. There is a weir arrangement by means of which the apparatus skims the contents of the surface of the sea. A pump within the sump compartment helps remove the surface layer while the cleaned water is led out from the lower region of the compartment. (See also W73-10598) (Sinha-OEIS)
W73-10597

APPARATUS FOR EXTRACTING OIL OR THE LIKE FROM THE SURFACE OF THE SEA,
Reynolds Submarine Services Corp., Miami, Fla. (assignee).
A. L. Markel, and R. F. Wirsching.
U. S. Patent No. 3,722,689, 4 p, 6 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 969, March 27, 1973.

Descriptors: *Patents, *Skimming, *Oil spills, Oil pollution, Equipment, Water quality control, Water pollution control, *Pollution abatement, *Weirs.
Identifiers: *Oil skimmers.

This invention uses a self-compensating weir arrangement disclosed in the copending application of R. F. Wirsching. The sump compartment is made sufficiently large so as to obtain deceleration of the flow of liquids which pass over the weir member. Vanes are used to generate a vortex within the sump compartment. The latter is made large enough so that a quiescent condition is obtained for the liquids therein. Oil obtained from the inner weir is pumped to a collecting vessel. (See also W73-10597) (Sinha-OEIS)
W73-10598

FLOATING OIL SKIMMING APPARATUS WITH OIL AND WATER SEPARATOR,
G. B. Stebbins, J. F. Stebbins, and J. G. Becker.
U. S. Patent No. 3,722,687, 5 p, 6 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 908, No 4, p 969, March 27, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Skimming, *Pollution abatement, Equipment, Water quality control, Water pollution control.
Identifiers: *Oil skimmers.

A novel floating oil skimmer continuously removes a floating oil and water mixture from the surface of a body of water and conditions the mixture for easy separation. The platform has a flat upper surface and an upstanding peripheral weir at its outer edge. The mixture flows over the weir toward the center of the platform where a second weir surrounds a sump. There is a centrifugal pump in the center of the sump. It aerates the mixture and transfers it to the top of a separating tank. Air and water rise while water at the bottom of the tank is continuously removed. (Sinha-OEIS)
W73-10599

OIL SPILLAGE DETECTION SYSTEM,
Durham Associates, Inc, Lynnfield, Mass. (assignee)
R. H. Daniels, and J. G. Zahka.
U. S. Patent No 3,719,936, 5 p, 5 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 908, No 1, p 246, March 6, 1973.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Pollution abatement, Water quality control, Water pollution control, Equipment.
Identifiers: *Oil sensors, Sensing.

A housing is adapted to be placed in a partially submerged buoyant state in a body of water. It has one or more input ports to permit entry of water and any oil which may be on the surface of the water. A selectively transmissive member is provided within the housing in a position exposed to the oil-water interface and operates to transmit the

oil. A sensor in one chamber within the housing detects the presence of oil. The sensor may be a resistance temperature dependent electrical thermometer or the sensor can be mechanically actuable by the weight of oil within the chamber to cause an output indication. The oil chamber can be removable for collection purposes. The system can also include a means for releasing a coalescing agent which combines with oil to provide for easier removal. A marking material can also be released to visually mark the spillage site. (Sinha-OEIS)

ESTABLISHING PRIORITIES IN MINE DRAINAGE REDUCTION, A COST-EFFECTIVENESS APPROACH,
Corps of Engineers, Baltimore, Md. Planning Div.
J. E. Crews.
Water Resources Bulletin, Vol 9, No 3, p 567-576, June 1973. 3 fig, 6 tab, 2 ref.

Descriptors: Water resources, Planning, *Water pollution control, *Acid mine water, Drainage, Watersheds (Basins), Methodology, Cost allocation, Streams, New York, Pennsylvania, Estimating, Optimization, Cost-benefit ratio, Lime, Neutralization, Water quality, Water supply, Systems analysis, Mathematical models, *Cost analysis, *Mine drainage.
Identifiers: *Cost-effectiveness, Cost minimization, *Susquehanna River basin, *Tioga River (Pa).

Twenty-seven watersheds in Susquehanna River Basin territory are severely degraded by acid mine drainage pollution. Approximately 620 miles of significant tributaries as well as 230 miles of principal rivers are either sterile or intermittently degraded by acid slugs. As a result of acid discharges, many uses of the streams, such as water supply and recreation, are rendered ineffectual. In past attempts at acid mine drainage abatement, programs did not look beyond the immediate problem area; no considerations were given to the blending effect of natural alkalinity in other streams. Since abatement of acid mine drainage pollution is extremely costly, a method of minimizing these costs has been devised. The systematic, cost-effectiveness approach is discussed. A case study of the Tioga River (Pa) is presented, and a mathematical model developed by the Baltimore District Corps of Engineers to optimize the system of abatement measures under objectives of improving water quality in the defined Tioga River reaches is described. By using the systematic, cost-effectiveness approach, water resources planners can control the allocation of funds for maximizing the abatement of acid mine drainage. (Bell-Cornell)

WATER QUALITY MANAGEMENT PLAN, INTERIM ST. CROIX RIVER BASIN.
Creative Research Services, Inc.

Prepared for Division of Water Quality, Minnesota Pollution Control Agency, St. Paul, 1971. 103 p, 5 fig, 20 tab, append.

Descriptors: *Planning, *Water quality control, Waste water treatment, Water quality standards, Environmental effects, *Minnesota, Treatment facilities.
Identifiers: *Water quality management plan, *St. Croix River Basin (Minn).

This report is one in a series of ten river basin, water quality management plans for the State of Minnesota. These plans represent a significant element in the state's river basin planning capabilities and are intended to meet federal requirements for construction grants for municipal wastewater treatment plants. The report defines the improvement needs for municipal wastewater treatment for the period 1971 to 1980. The main areas of discussion are (1) a description of the river basin including geography, economic activities, and population; (2) information on the water resources of the basin including surface and groundwater, water supplies, and water use; (3) information on water quality with emphasis on stream standards and effluent standards; (4) tables of principal effluent sources; (5) the effects of the effluent discharges on water quality in the basin; (6) an evaluation and priority ranking of treatment needs; and (7) an interim pollution abatement plan including objectives, sewer and treatment plant needs, cost estimates, implementation measures, and probable environmental impact. EVALUATION OF THE OHIO WATER SUPPLY PROGRAM: SUMMARY.
Environmental Protection Agency, Chicago, Ill. Div. of Air and Water Programs.

Available from the National Technical Information Service as PB-214 058, $3.00 in paper copy, $0.95 in microfiche. July, 1972. 19 p, 2 fig.

Descriptors: *Water supply, *Evaluation, Quality control, Inspection, Regulation, Monitoring, Administrative agencies, *Ohio, *Potable water.
Identifiers: Ohio Public Water Supply Program.

An evaluation of the Ohio Public Water Supply Program in terms of its ability to provide safe, wholesome drinking water deals primarily with state activities related to the regulation and surveillance of community water supplies. The study found that established standards of good practice were not being universally met in the state. For example, many water supply systems were either not meeting drinking water standards, not keeping good records, or not being inspected by state regulatory agencies. State agencies, such as the Department of Health, were generally limited in staff and money and were reluctant to issue orders to correct local deficiencies. It is concluded that Ohio must expand and improve its community water supply program. Specific recommendations include an increased budget and professional staff for surveillance activities, the implementation of annula sanitary surveys of each community water supply, monthly reports from treatment plant operators, the use of automatic data processing techniques, and the creation of new state regulation. SALINITY PROBLEMS OF IMPOUNDMENTS AND THEIR MANAGEMENT,
Agricultural Research Service Chickasha, Okla. Soil and Water Conservation Research Div.
H. B. Pionke, and O. D. Workman.
In: Great Plains Agricultural Council Publication No. 60, Control of Agricultural-Related Pollution in the Great Plains, Seminar, July 24-25, 1972, Lincoln, Nebraska, p 155-167, 6 fig, 5 ref.

Descriptors: *Impoundments, *Water quality, Salinity, *Water management, Routing, Reservoir operation, Diversion, *Great Plains.
Identifiers: *Salinization hazard, *Inflow classification.

Impoundment can cause the salinization of retained or outflow waters, particularly in areas characterized by low rainfall and high evaporation rates as exist in parts of the Great Plains. The realistic control of the salinization associated with impoundment depends on the proper classification of the hazard. Areas classed according to high or low hazard have or require few management options. Those classified as low-hazard could sustain considerable change in salinity without affecting the continued or projected use of the impounded and outflow waters. Conversely, the projected salinity of waters associated with areas classified as hazardous could severely limit or prohibit their use. Where the salinization potential is intermediate, the problem may be managed to minimize a salinity increase without greatly modifying or precluding impoundment. Some of the techniques considered include preferential routing of inflow waters, minor design modifications, relocation of the structure, and the use of evaporation retardants to minimize salinity increase. DYNAMICS OF WASTE ACCUMULATION: DISPOSAL VERSUS RECYCLING,
V. L. Smith.
The Quarterly Journal of Economics, Vol 86, No 4, p 600-616, November 1972. 5 fig, 15 equ, 11 ref.

Descriptors: *Water pollution control, *Pollution abatement, *Waste disposal, *Recycling, *Pollution taxes (Charges), Economics, Litter, Equations, Model studies, Constraints, Costs, Prices.
Identifiers: *Environmental quality, Scrap value.

UNIVERSITY OF L. URBANA-CHAMPAIGN

A simple control model of the economics of waste recycling is presented. Pollution, litter, or waste disposal is assumed to enter the economic system as a public bad in household utility functions. The resulting subjective cost of using the environment for discharge is not borne directly by those whose decisions result in environmental degradation. The optimal control solution requires a price to be associated with waste discharge, depending upon the accumulated stock of waste, the interest rate, and the rate at which waste decomposes in nature. A competitive decentralized economy is generated by the model when the waste discharge price is identically zero. This corresponds to an unappropriated environment available to all as a free resource for waste discharge. The control solution and the decentralized competitive solution approach the same stationary state equilibrium in two special cases, involving: (1) High private recycling costs; and (2) low private recycling costs. To economists, the natural control device is a Pigouvian system of user charges. Some of the features of a Senate bill designed to institute pollution charges on packaging materials also are discussed. (Bell-Cornell)

PRICING OF POLLUTION: THE COASE THEOREM IN THE LONG RUN,
California Univ., Los Angeles; and National Center for Health Services Research and Development, Rockville, Md.
H. E. Frech, III.
The Bell Journal of Economics and Management Science, Vol 4, No 1, p 316-319, Spring 1973. 8 ref.

Descriptors: *Pollution abatement, *Pollution taxes (Charges), *Industries, Basins, Resource allocation, Market value, Profit, Water pollution, Air pollution, *Cost analysis.
Identifiers: *Coase Theorem.

In an earlier article in this Journal, R. A. Tybout attempted a refutation of the long run applicability of the Coase Theorem. He argued that even in a zero transaction costs model, bribery to reduce pollution and compensation charges for it result in different total profits, and thus in different long-run behavior. This paper demonstrates that Tybout's result is based on a fundamental error in the analysis of costs for the polluting and polluted industries. The property right to the polluted (air or water) basin is a valuable asset with a definite market value. When the rent of this valuable asset is properly included in the costs of the industry holding the right, marginal and total profits are shown to be identical regardless of the assignment of the basin ownership. THE SPOILS OF PROGRESS: ENVIRONMENTAL POLLUTION IN THE SOVIET UNION,
M. I. Goldman.
M.I.T. Press: Cambridge, Mass., ; London, England. 1972. 372 p, Illus. Maps. Pr. $7.95.
Identifiers: Aral Sea, Books, Caspian Sea, *Environmental effects, Lakes, Laws, Pollution, Sea, *USSR, Lake Baikal.

Abuses are described of water, air, land and raw materials in Russia, analyzing the forces that have brought about the current situation and describing both the drawbacks and advantages of state control and conservation. Chapters are included on the theory and law of environmental protection in the socialist state and the economic and political propensity to pollute. The effects of Soviet urbanization, industrialization and growing technological prowess on the natural resources of the country are considered in detail. Case studies of how Lake Baikal and the Caspian and Aral Seas were exploited for economic purposes to the detriment of the environment are included. Finally, the genuine advantages of the Soviet system are examined along with some of the implications of Soviet practices for the rest of the world. There is no reason to believe that state ownership of the means of production will necessarily guarantee the elimination of environmental disruption.—Copyright 1972, Biological Abstracts, Inc.

COST ANALYSIS OF WATER POLLUTION CONTROL: AN ANNOTATED BIBLIOGRAPHY,
Environmental Protection Agency, Washington, D.C. Office of Research and Monitoring.
D. P. Tihansky.
Copy available from GPO Sup Doc as EP1.23/3:73-017, $3.95; microfiche from NTIS as PB-221 146, $0.95. Environmental Protection Agency, Socioeconomic Environmental Studies Report, EPA-R5-73-017, April 1973. EPA Project 01-AAB-01. Program Element H11094.

Descriptors: *Bibliographies, *Cost Analysis, *Costs, *Water Pollution Control, *Abstracts, Cost comparisons, *Cost-benefit analysis, Economics.

This annotated bibliography is a compilation of the literature on water pollution control costs. It contains nearly 2,000 selected publications, unpublished papers, and theses focusing on the time period from 1960 to 1972, although earlier material is added if it seems particularly relevant. The references are chosen to satisfy the needs and interests of several types of researchers. For the economist, there are books and articles on economic theory and incentive systems in water quality management. For the engineer, there is information on unit treatment processes and cost implications of their design and operation. For the operations research analyst, optimization techniques, mathematical modeling, and statistical methods are referenced as they apply to waste water control. For the policy maker, cost function literature identifies the primary determinants of cost and their quantitative effects. Political and socio-economic issues are also related to water pollution control. (EPA)

INVESTIGATION OF USE OF GEL MATERIAL FOR MINE SEALING,
Dravo Corp., Pittsburgh, Pa.
N. K. Chung.
Copy available from GPO Sup Doc as EP1.23/2:72-135, $1.25; microfiche from NTIS as PB-221 247, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-72-135, December 1972. 67 p, 27 fig, 11 tab. EPA Project 14010 EKW.

Descriptors: *Acid mine water, *Mine drainage, Abatement, *Sealants, *Gels, Water pollution control.
Identifiers: *Chemical grouts, *Mine sealing.

Laboratory testing of commercially available chemical grouts was conducted to evaluate their potential use, in conjunction with a cheap filler, for remote sealing of mine voids. By close control of the setting time and proper distribution of the grout slurry it was believed that a mine seal could be placed through a borehole from the surface without the benefit of retaining bulkheads. A slurry mix consisting of an acrylamide grout with flyash or mine refuse as a filler was found to produce a strong controllable gel which resisted chemical attack in the laboratory over an eleven week exposure period. An attempt to demonstrate a novel technique for application of the selected grout slurry in a mine entry with high flow was not successful. The results suggest that the technique may be applicable in dry or low flow situations. However, the estimated cost of a mine seal using the gel material is presently not competitive with existing methods.Groundwater monitor wells were drilled for the purpose of determining the effect of mine sealing on groundwater conditions. Data reflecting pre-seal conditions were compiled, but because the sealing of the mine was not completed the monitoring program has been postponed. (EPA)

A SEARCH: NEW TECHNOLOGY FOR PAVEMENT SNOW AND ICE CONTROL,
Abt Associates, Inc., Cambridge, Mass.
D. M. Murray, and M. R. Eigerman.
Copy available from GPO Sup Doc as EP1.23/2:72-125, $1.00; microfiche from NTIS as PB-221 250, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-72-125, December 1972. 54 p, 5 fig, 3 tab, 65 ref. EPA Project Z-800615. Contract No. 68-01-0706.

Descriptors: Water pollution control, Cost-benefit analysis, *Ice, *Snow removal, Snow management, Roads, Equipment, *Deicers, *Heating, Cost analysis, *Highway icing.
Identifiers: *Snow plows.

A study was undertaken to search for new approaches to the problem of snow removal and ice control. Proven techniques of technology transfer were applied for the purpose of identifying technologies that have not yet been utilized for deicing purposes. Contracts with specialists and a 'brainstorming session' were used to determine strategies for search of computerized data banks. Although several approaches were identified, none are immediately useable. Results indicate that: (1) More information is needed on salt damage to the environment, highway structures, and vehicles in order to perform accurate cost-benefit analyses of alternative approaches. (2) More complete knowledge is needed on the effects of alternate chemical deicers. (3) Pavement heating is an expensive means of removing snow and ice but can be justified in special cases for safety or environmental reasons. (4) Two mechanical devices, snow plow with compressed air and a brush and blower system require further testing and development. (5) Research is required to identify a hydrophobic substance which can be applied to pavement to reduce ice adhesion. A brief cost estimate of the various approaches has been included. (EPA)

CONCEPT EVALUATION: RECOVERY OF FLOATING OIL USING POLYURETHANE FOAM SORBENT,
Battelle-Pacific Northwest Labs., Richland, Wash.
C. H. Henager, and J. D. Smith.
Copy available from GPO Sup Doc as EP1.23/2:72-049, $1.50; microfiche from NTIS as PB-221 251, $0.95. Environmental Protection Agency, Technology Series Report EPA-R2-72-049, September 1972. 97 p, 29 fig, 6 tab, 7 ref. EPA Project 15080 HEU. Contract 68-01-0070.

Descriptors: Evaluation, *Oily water, *Separation techniques, Technical Feasibility, Efficiencies, Hydraulic systems, Hydrodynamics, Jets, Testing, Water Pollution Treatment, *Oil spills, Oil pollution, Oilwater interfaces.
Identifiers: *Sorbents, *Polyurethane foams, Equipment development, *Oil recovery.

Individual components of an oil spill recovery system were evaluated using Bunker C oil and three crude oils ranging in API gravity from 14 degrees to 42 degrees. The system was designed to

shred and broadcast polyurthane foam sorbent onto an oil slick, herd the sorbent to a shipside conveyor by a water spray boom, squeeze the sorbent to extract the oil and rebroadcast the sorbent. The initial concept was to build a half-size, full scale system; however, initial foam losses indicated the necessity for a re-evaluation of the program, and specific studies on the broadcasting and 'squeezing' systems were undertaken. The shredder-broadcaster, a commercial straw mulcher, produced acceptable shredding of dry foam. However, multiple cycling degraded oil-soaked foam to unrecoverable sizes in relatively few cycles. With Bunker C oil, 47 percent of the foam was reduced to sizes less than 1/2' in 5 cycles. With light Canadian crude oil, 29 percent was reduced to less than 1/2' in 100 cycles. A sorbent-oil separator using perforated rolls, was designed to extract viscous oils from the foam at 20C, without heating, at rates of up to 5000 gph. This device showed good recovery of oil from foam. Multiple cycling of Bunker C-oil-soaked foam through the full scale device resulted in a small loss of foam by size reduction (3.5 percent in 77 cycles). After 77 cycles of extracting Bunker C oil, foam damage by loss of resiliency reduced oil extraction per cycle to about 25 percent of the initial amount. No loss of resiliency was observed up to about 50 cycles. Because of the high sorbent losses in the shredder-broadcaster, the systems as initially proposed is not recommended for use with Bunker C oil. (EPA)

THE DEVELOPMENT OF A PLAN OF STUDY--AN INTERAGENCY APPROACH TO MULTIOBJECTIVE PLANNING AND EVALUATION OF WATER AND LAND RESOURCE USE,
Economic Research Service, Davis. Natural Resource Economics Div.
R. B. McKusick, J. M. Kress, P. G. Ashton, and W. A. Bunter, Jr.
Water Resources Bulletin, Vol 9, No 3, p 467-484, June 1973. 2 fig, 14 ref.

Descriptors: Water resources, *Comprehensive planning, *Alternative planning, Evaluation, *Linear programming, *Inter-agency cooperation, Optimization, Systems analysis, Mathematical models, Natural resources, *Resource allocation, Land use, Demand, Regional development, Agriculture, Forestry, Recreation, Water utilization, Multiple purpose.
Identifiers: *Multidisciplinary approach, Environmental quality, National economic development.

Presented is a systems approach evaluating alternative plans for resource use incorporating the concepts of multiobjective planning and evaluation (MOPE). The need for multidisciplinary input and strong interagency cooperation in planning for resource use is related to the logical and orderly completion of the planning steps. MOPE is described briefly, emphasizing two important concepts: (1) The relationship of the study problems and objectives to national social objectives; and (2) the display of alternative solutions showing tradeoffs. Several important characteristics of a plan of study which implements MOPE are presented and discussed. A proposed MOPE analytical system is discussed in detail. The MOPE analytical system is divided into eight interdependent subsystems that describe data collection, use, analysis, and results. A linear programming model is presented that analyzes the present and future demand relationships for natural resources. The model will also evaluate the interaction of agriculture, forestry, and recreation with the resource base of the basin, considering National Economic Development, Environmental Quality, and Regional Development. (Bell-Cornell)

COMPUTER SIMULATION OF RECREATIONAL BOATING ACTIVITIES,
Army Engineer District, Chicago, Ill. Economics Branch.
A. L. Dietz.
Water Resources Bulletin, Vol 9, No 3, p 494-498, June 1973.

Descriptors: *Simulation analysis, *Computer models, Harbors, *Lake Michigan, *Boating, *Recreation demand, Alternative planning, Evaluation, Probability, Methodology, Systems analysis, Mathematical models.
Identifiers: *Harbor improvement, Travel behavior, Transient, Refuge, Small boat harbors, Predicting.

Lake Michigan provides the necessary conditions for reducing the region's outdoor recreational boating supply deficiency. However, the presence of the Lake itself is not sufficient to solve the deficiency problem because use is strictly controlled by a limited number of access points. A solution is selected site expansion to not only provide access but also service the refuge and transient needs. Harbor improvement planning which identifies the refuge and transient service needs at points along Lake Michigan is considered. The travel behavior model developed to predict this use is sensitive to five criteria: boater characteristics which influence travel behavior; entry rates into the Lake from each access site; site characteristics; weather conditions; and planning parameters. The model estimates: the number of boaters demanding a given access point at a given time; length of stay at that point; probability of travel to specific access sites in given amounts of time; and those facilities used during a specified time period. The simulation modelling boat movement consists of two parts: a traffic generation routine and an activity simulation. The former schedules the entry of boats into the Lake from each site and the latter establishes the probabilistic movement of boats on the Lake. This simulation of interport movements and port activities enables the planner to investigate some impacts of alternative small boat harbor development plans. (Bell-Cornell)

W.A.L.R.U.S. I WATER AND LAND RESOURCE UTILIZATION SIMULATION,
Michigan Univ., Ann Arbor. School of Natural Resources.
A. G. Feldt, D. Moses, and J. Eckroad.
Available from the National Technical Information Service as COM-72-10811, $3.00 in paper copy, $0.95 in microfiche. Sea Grant Program, Technical Report No. 28, The University of Michigan, May, 1972. 69 p, 3 fig, 6 tab, 1 ref.

Descriptors: *Simulation analysis, *Computer programs, *Computer models, *Planning, Water resources, *Land use, *Water users, Environment, Governments, Communication, Economic aspects, Public lands, Public utilities, Sewers, Pollutants, Model studies, Operations research.
Identifiers: *Gaming-simulation.

Presented is WALRUS I, the first in a series of three games developed to provide a basis for communication and interaction among Sea Grant personnel engaged in specialized water resources research and between such personnel and the lay public they are seeking to serve. Successive models in the series will provide gaming-simulation models of increasing complexity and highly sophisticated and realistic simulation of human communities and their interrelationships with the environment. This first game in the series is necessarily quite crude. In a sense, WALRUS I is more of a questionnaire than a simulation model in that it was primarily designed to ask whether or not the

UNIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

kinds of factors contained within its framework were the appropriate ones to be considered in dealing with local efforts at water resources planning. The answer has been a qualified 'yes' from a considerable range of persons who have played the initial forms of the model. WALRUS I has proved satisfactory for its basic purposes and to introduce many persons to the use of gaming-simulation models. However, the game is best understood by playing it. (Bell-Cornell)

CSS: A COMPUTER PROGRAM FOR MODELING ECOLOGICAL SYSTEMS,
Oak Ridge National Lab., Tenn.
P. Sollins.
Available from the National Technical Information Service as ORNL-1BP-71-5, $3.00 in paper copy, $0.95 in microfiche. ORNL-1BP-71-5, Aug 1971. 96 p, 5 fig, 13 tab, 7 ref, 3 appen.

Descriptors: *Digital computers, *Computer programs, *Ecology, *Ecosystems, *Simulation analysis, Model studies, Equations, Data collections.
Identifiers: Storage components, Flow functions, Compartment models, Time factor, Dynamic structure.

Two major objectives in the analysis of ecosystems are: (1) Basic research into the mechanisms of ecosystem processes; and (2) prediction of effects of perturbations on the ecosystem and its components. Modeling can be useful in attaining these goals by introducing consistency and order to individual process studies and by allowing the researcher to view the implications of particular hypotheses in terms of the behavior of the overall system. CSS is a digital computer program developed to allow ecologists with minimal training in mathematics and computer programming to construct and test a wide variety of ecosystem models. A CSS model is a set of simultaneous differential equations. Nonlinear and time-dependent functions are permitted for transfers between storage components; however, the models must be predominantly continuous. Sources and sinks may be defined. Concepts necessary for program use are discussed, including preparation of program input and interpretation of program outputs. Two test cases and a listing of the program are provided. (Bell-Cornell)

A COMPARATIVE STUDY OF RESOURCE ANALYSIS METHODS,
Harvard Univ., Cambridge, Mass. Dept. of Landscape Architecture.
T. Murray, D. Sinton, D. Way, and C. Steinitz.
Available from the National Technical Information Service as AD-751 299. $6.00 in paper copy, $0.95 in microfiche. August 1969. 369 p, 176 fig, 3 tab, 73 ref, 11 appen.

Descriptors: *Resources, *Analysis, *Data collections, Documentation, *Computer programs, *Land use, Planning, Surveys, Evaluation, Water resources, Model studies, Systems analysis, Rivers, Watersheds (Basins), *Massachusetts.
Identifiers: *Boston (Mass.), Charles River (Mass.).

The need for resource policies which minimize the inevitable conflicts among the various demands for land calls for precise analytic and predictive methods for effective land use planning. A comparative analysis of current significant approaches to resource analysis by selected individuals and groups is presented. Despite the substantial amount of good work being done in resource analysis, a common failing in this field is a lack of documentation. Descriptions of the approaches are applied to a model for data inventory which can then be used as a basis for comparing the method descriptions. The model, relies heavily on computer use and is detailed in section II of this study. Section III describes the selected approaches, including: Their methodological goals; constraints under which the method was developed or under which it operates; data variables which are investigated; logic of the analytic approach; the applicability of the method to other areas, scales, and purposes; and its principal documentation. The method of comparison used is to abstract the logic of the approach and apply it to the common base of data bank describing the Boston Southwest Sector. Section IV is a comparative discussion of the efficacy of these methods. (Bell-Cornell).

MOBILIZATION AND PARTICIPATION OF CITIZENS GROUPS IN IMPROVING THE QUALITY OF WATER RESOURCES ENVIRONMENTS,
Minnesota Univ., Minneapolis. Dept. of Anthropology.
L. P. Gerlach.
Available from the National Technical Information Service as PB-220 964, $3.00 in paper copy, $0.95 in microfiche. Minnesota Water Resources Research Center, St. Paul, Bulletin 57. April 1973. 16 p, 6 ref. OWRR B-031-MINN (1). 14-31-0001-3096.

Descriptors: Ecology, Environment, Environmental effects, Water resources, *Social participation, *Social values, Attitudes, Motivation, Social change, Organizations.
Identifiers: *Ecology movement, *Environmental issues, Ideology.

The ecology movement has the same general characteristics of segmentary, polycentric, reticulate organization as such other movements as the Black Power Movement and the Pentecostal Movement. The diverse groups concerned with environmental issues can be arranged on a continuum from established and routinized to new and radical. These groups proliferated rapidly from about 1969-1972. The ecology movement functions as a whole because of the way its different segments interweave in a network. There is considerable overlap between ecology groups and various 'counter-culture' segments. Recruitment to ecology groups is characteristically through face-to-face contact instead of via large scale advertising. Commitment to the ecology movement was not accomplished as dramatically as with Black Power or Pentecostalism. The opposition to the ecology movement was real and often powerful but environmentalists often perceived it to be more sinister and powerful than was the case. Common ideology concepts of the ecology movement are: doomsday theme, share guilt for environmental degradation, finite resources leading to a zero sum game, closed system and spaceship earth, need for recycling, need to control or limit growth, ecosystem and interdependence, need for significant change, and system change means lifestyle change.

LOCAL ECONOMIC IMPACT OF RESERVOIR RECREATION,
Tennessee Univ., Knoxville. Dept. of Economics.
C. B. Garrison.
Center for Business and Economic Research, Water Resources Research Center, Tennessee University, Research Report No. 27, July, 1972. 37 p, 15 tab, append. OWRR A-020-TENN (2). 14-31-0001-3543.

Descriptors: *Economic impact, *Income analysis, Water resources development, *Tennessee, *Rural areas, *Recreation, Reservoirs.
Identifiers: Multiplier effect, Primary impact, Secondary impact, *Norris Reservoir (Tenn), Local income multiplier.

Reservoir recreation affects the economy of the local area and also the larger region in which the reservoir is located. Using Norris Lake reservoir in east Tennessee as an example, the local impact of reservoir recreation activities on the surrounding rural area was studied. The impact was decomposed into (a) the primary and (b) the secondary effect. The primary effect included employment and payroll of enterprises which sell goods and services directly to recreation users. As of 1967, direct earnings of those employed in recreation-based enterprises accounted for less than two percent of the area's total personal income. The secondary impact, defined as the multiplier effects of the primary impact, were found to be small. The present study also compared the local economic impacts of utilizing a reservoir for recreation with those of establishing water-intensive manufacturing industry. The impact of water-intensive industry was found to be significantly greater than that of recreation development. (Weaver-Wisconsin)

METHODOLOGICAL IMPROVEMENTS IN MEASURING ECONOMIC EFFECTS OF MULTIPURPOSE WATER RESOURCE PROJECTS.
Berger (Louis), Inc., East Orange, N.J.

Available from the National Technical Information Service as PB-220 966, $4.85 in paper copy, $0.95 in microfiche. Completion Report, March 30, 1973. 79 p, 6 fig, 31 tab, 58 ref. OWRR C-3068 (3731) (1).

Descriptors: *Economic impacts, *Benefit-cost analysis, Benefit-cost ratios, Benefit-cost theory, Beneficial use, *Multiple-purpose reservoirs, Water supply, Benefits, *Multiple-purpose projects, Power, Recreation, Conservation, Municipal water, Industrial water, Agricultural economics, Flood control, Irrigation, *California.
Identifiers: Pine Flat Dam, Santa Maria Project, Trinity Project, Tulare Lake, Land enhancement, Twitchell Dam, Payment capacity.

The purpose was to analyze the methods currently used in the evaluation of the benefits and costs of multipurpose water resource projects, to recommend changes to these methods and to develop new ones which will improve these evaluations. The study was carried out by analyzing three completed multipurpose water projects: the Pine Flat Dam and Reservoir near Fresno, the Santa Maria Project near Santa Maria, and the Trinity River Division of the Central Valley Project near Redding (all in California). This group includes projects developed for providing flood protection, supplies of irrigation water, municipal and industrial water supplies, hydroelectric power, fish and wildlife habitats, and recreation. The study basically followed the structure of a benefit-cost analysis of the projects. Particular attention was paid to many environmental impacts which were improperly treated in the original plans for development. The principal recommendation to improve water project evaluation is the extension of analysis beyond the fundamental benefit-cost analysis to include many crucial impacts which are not quantifiable in monetary terms.
W73-10417

VALUES AND COST ALLOCATIONS OF SURFACE-WATER USE AND TREATMENT,
New Hampshire Univ., Durham. Agricultural Experiment Station.
R. A. Andrews, and R. R. Weyrick.
Available from the National Technical Information Service as PB-221 103, $4.85 in paper copy, $0.95 in microfiche. Publication No 500, 1972. 89 p, 7 fig, 25 tab, 9 ref. 4 append. OWRR C-1713 (No 3160) (1).

Descriptors: *Economic impact, Economics, *Linear programming, *Cost allocation, *New Hampshire, *Implied benefits, Resources, Evaluation, Water utilization, Model studies, River basin development.
Identifiers: Resource use sensitivity, *Resource allocation.

A linear programming model for a river basin was developed to include almost all water related economic activity both for consumers and producers. The model was so designed that the entire basin or basin subdivision could be analyzed. The model included seven sectors, more than nine objective function criteria, three river flow levels, two river water quality classifications and projections of population to 1980. Economic basis for conflicts among sectors over incidence of cost allocation and level of economic activity can be traced to some chosen objective. The imputed variable cost for median river flow level of 'B' class for approximately current economic activity and minimizing cost was 12 cents per pound of BOD. This cost increased to 14.6 cents when population was projected to 1980. Sensitivity analysis indicated that the optimal level of resource allocation was quite stable at each flow level. Lake shoreline was the dominant feature determining lake resource valuation. Implied capital value varied from 126 dollars per foot to over 250 dollars depending on discount rate. Imputed prices on lake surface ranged from 42 dollars to 147 dollars an acre depending on location and discount rate. Strong economic forces encouraged small lot sizes for vacation cottages.
W73-10558

AN ECONOMIC EVALUATION OF A WATER-BASED URBAN TOURIST ATTRACTION IN SAN ANTONIO, TEXAS,
Texas A and M Univ., College Station. Water Resources Inst.
W. L. Trock, and R. D. Lacewell.
Available from the National Technical Information Service as PB-221 024, $3.00 in paper copy, $0.95 in microfiche. Technical Report 48, April 1973, 131 p, 92 tab, 11 ref. OWRR B-103-TEX (1). 14-31-0001-3653.

Descriptors: *Economic impact, River basin development, *Urban sociology, *Evaluation, *Texas, Tourism, City planning, Attitudes, Social aspects, Recreation.
Identifiers: *San Antonio (Texas), *Paseo del Rio (Tex).

The purpose is to determine the economic effect of the Paseo del Rio on commercial enterprises and activities as it affects tourism and recreation in the central city. Based on the assumption that the economic effects of the developed river area arise from the expenditures of the users, and that beneficiaries are the businesses surrounding the area, three surveys have been conducted. One concerned users of the developed river area. It served to identify their socio-economic characteristics and other relevant factors which might be important to their knowledge and use of the river. The second was a survey of the businesses in the central business district to identify their economic characteristics, their relationship to the Paseo del Rio, and the proportions of gross receipts of these businesses attributable to the developed river area. A third survey served to identify characteristics of residents of San Antonio, their knowledge of the Paseo del Rio and their use of it for various purposes. (Runkles-Tex A and M)

Identifiers: Economic analysis, Sensitivity analysis, White River, Bloomfield (Ind), *Bayesian decision analysis, Visitation rates, Water-based recreation, *Sequential decision theory, Empirical prediction equations.

Benefits from recreation facilities can be estimated by multiplying the estimated number of user-days by an administratively determined dollar value per user-day. Such a method requires accurate estimates of total visitation to a proposed facility. The use of sequential decision theory for estimating recreation visitation rates is demonstrated. Bayesian decision analysis provides a convenient statistical framework in which estimates of recreation visitation using different methods can be combined to provide a more accurate estimate than that obtained from a single source. The Bayesian framework also provides a means of determining the optimal (with respect to a preselected cost function) number of interviews that should be conducted in the primary market area. The procedure is demonstrated for a hypothetical recreation site in southern Indiana. Actual census data for 1970 is used with empirical prediction equations to estimate visitation rates for the hypothetical site. The empirical estimates and visitation rates observed at existing facilities were used to establish a prior probability distribution for visitation to the proposed recreation facilities. The methodology of revising the initial probability distribution according to the results of user interviews is demonstrated. The effects of uncertainty involved in estimating visitation rates are assessed using sensitivity analysis. (Bell-Cornell)

Identifiers: Citizens Review Committees, Quabbin Reservoir, Boston Metropolitan area.

The need for water resource planners and engineers to focus more attention on the ecologic and social aspects of their projects and proposals is discussed. The example used is the proposal to divert flood waters from the Connecticut River to the Quabbin Reservoir which is the major source of water supply for the Boston metropolitan area. Because of the drought of 1962-1966 and the increasing demands for water the reservoir is operating at about 50% of its capacity. However, the diversion proposal has met strong opposition, particularly on environmental and social issues. With the new environmental concern in this country and the passage of the National Environmental Protection Act it is not enough to simply consider engineering and economic aspects of projects. Thus, in relation to water diversions such factors as fish populations, nutrients, wastewater dilution, estuarine processes, and groundwater recharge must be studied. Also it is very important to incorporate constructive public involvement in the planning process. Citizens review committees are being effectively used in New England where a broad spectrum of water uses have been investigated. Support of proposed action programs by concerned citizens well may have a greater influence on public policy and decisions on water resources development in the future. (Elfers-North Carolina)

AN ANNOTATED OUTLINE OF A WATER-RESOURCES DEVELOPMENT PLAN FOR ALABAMA,
Geological Survey of Alabama, University.
H. C. Barksdale.
Available from the National Technical Information Service as PB-213 698, $3.00 in paper copy, $0.95 in microfiche. Prepared for Alabama Development Office, Office of State Planning, Montgomery, February, 1971, Revised August 1971. Report No. ALA-GSA-X996-WRC-71-4. 23 p. WRC-71.

Descriptors: *Planning, *Water resources development, Conservation, Water supply, Environmental effects, Water demand, Institutions, *Alabama, *Management, Flood plains.

Identifiers: Flood plain management.

This short report is a general prospectus for a water resource development plan for the State of Alabama. It is felt that a water resource development plan should be an integral part of overall state planning as water is closely related to the economic and social growth and well-being of the state. The report stresses both the development and the conservation of water resources and sees conservation as a key element of a development plan. Some of the uses of water that the plan will include are domestic supply, industry, agriculture, power, fish and wildlife, waste disposal, recreation, and environmental enhancement. The prospectus also emphasizes flood-plain management and the need for more data and research in such areas as current water use, future water needs, coastal zone areas, urban hydrology, new reservoir sites, water rights, and institutional arrangements. ASSESSMENT OF GEOTHERMAL ENERGY RESOURCES.
Department of the Interior, Washington, D.C. Panel on Geothermal Energy Resources.

Report prepared for the Committee on Energy Research and Development Goals, Federal Council for Science and Technology, September 1972. 84 p, 2 tab, 2 fig, 114 refs.

Descriptors: *Geothermal studies, *Energy, *Natural resources, *Assessments, *Water supply, Mineral water, Economic impact, Steam, Hotsprings, Electrical studies, Demand, Hawaii, Alaska, Technology, Research and development, Exploration, Groundwater recharge, Power plants, Desalination, Brines, Mining, Chemicals, Monitoring, Environmental effects, Hydrogen sulfide, Drilling, Model studies, Laboratory tests.
Identifiers: Western U.S.

Members of numerous federal agencies cooperated in meeting the request of the President of the U.S. in his message on energy of June 1971. This report summarizes an assessment of geothermal energy resources. These resources are natural sources of clean energy, water and minerals that could have significant impact if fully developed. Steam and hot water could provide a substantial part of the Nation's electrical energy needs in the next few decades, especially in western states, Hawaii and Alaska. At least 19,000 MW of generating capacity could be installed by 1985 under present technology, or more than 75,000 MW by 2000 under successful research and development. Research, exploration, development skills, recharge, geothermal stimulation of dry rocks, improved power generation technology, desalination of geothermal brines, geothermal mining of chemicals, monitoring environmental effects, romoval of H2S and noise from drilling, development of a model code, better government and related liaison, and establishment of several national geothermal field research laboratories are recommended. Available from the National Technical Information Service as PB-221 123, $3.00 in paper copy, $0.95 in microfiche. Completion Report, Publication No 28, 1973. 160p, 7 append. OWRR C-2169 (No. 3377) (1).

Descriptors: Water supply, *Inter-basin transfer, *Alteration of flow, *Connecticut River, *Social attitudes, Social participation, Decision-making, Environment, Sediment transport, Anadromous fish, Migration, Nutrients, Water quality, Estuarine environment, *Diversion.
Identifiers: Northfield Mountain, *Boston, Quabbin Reservoir, Metropolitan District Commission, Corps of Engineers.

A study of public response to the proposal to divert flood waters from the Connecticut River at the Northfield Mountain pumped-storage hydropower plant to Quabbin Reservoir, Boston's major water supply impoundment, showed that opposition, while appearing to be broadly based, was actually limited to a relatively few knowledgeable, highly motivated individuals whose efforts delayed project approval but did not succeed in significantly influencing public officials and decision-makers. A study of potential environmental impacts based on available but generally scanty data indicated that the reduction of flood flows as proposed would (1) have little effect on sediment transport; (2) not affect significantly anadromous fish migration; (3) not affect significantly the total nutrient contribution to Long Island Sound; (4) produce no significant effect on Biochemical Oxygen Demand or on coliform organism count; (5) possibly cause changes in the estuary, none of which by itself appears significant; (6) not affect significantly the Basin's future sources of water supply. The results do not support a contention that the proposed diversion would (1) be viewed by a majority of Basin residents as significantly deleterious; (2) produce a high probability of damage to ecologic and environmental values. MAN-NATURE ATTITUDES OF ARIZONA WATER RESOURCE LEADERS,
Maryland Dept. of Water Resources, Annapolis.
R. A. Kanerva, and D. A. King.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 53-66, (1972). 3 tab, 4 fig, 14 ref.

Descriptors: *Attitudes, *Arizona, *Water resources, *Administration, Decision making, Environment, Cultures, Input-output analysis, Scaling, Water management (Applied), Arid lands.

A pilot study is developed to construct a scale which measures attitude towards human management in Arizona. The decision-maker's attitudes toward his man-made and natural environments are investigated in terms of cultural (interior), natural (intermediate), and balanced (exterior) reference positions. A decision-making model consists of stimuli (inputs), decision-making (process function), and response (outputs). The 12 questions developed and applied to Arizona water managers were reduced to 8 capable scalogram analysis. These scaled questions related to favoring physical or emotional needs of man, deciding who gets what or increasing the supply, including behavioral patterns, protecting environmental areas, manipulation of resources as harmful or beneficial, municipal and industrial demands, opinions of groups, and possible overuse of resources. The scale met 5 criteria, which are defined by reproducibility, non-scale pattern of response, number of questions, error ratio and cross checking of responses. This study may provide managers with means of objectively evaluating and improving decisions. (See also W73-10818) (Popkin-Arizona)

In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 319-350, (1972). 4 tab, 36 ref.

Descriptors: *Hydrologic data, *Arizona, *Mathematical studies, *Statistical methods, *Decision

making, Water sampling, Model studies, Forecasting, Aquifers, Watersheds, Streamflow, Precipitation (Atmospheric), Control, Multiple purpose, Risks, Correlation analysis, Systems analysis, Seasonal, Probability, Ranges, Time series analysis, Regression analysis, Stream gages, Digital computers.

Mathematical models, requiring substantial data, of hydrologic and water resources systems are under intensive investigation. The processes of data analysis and model building are interrelated so that models may be used to forecast for scientific reasons or decision making. Examples are drawn from research on modeling aquifers, watersheds, streamflow and precipitation in Arizona. Classes of problems include model choice, parameter estimates, initial condition, input identification, forecasting, valuation, control, presence of multiple objectives, and uncertainty. Classes of data analysis include correlation methods, system identification, stationarity, independence or randomness, seasonality, event based approach, fitting of probability distributions, and analysis for runs, range and crossing levels. Time series, event based and regression methods are reviewed. The issues discussed are applied to tree-ring analyses, streamflow gaging stations, and digital modeling of small watersheds and the Tucson aquifers. (See also W73-10818) (Popkin-Arizona)

6D. Water Demand

WATER USE, (AWWA COMMITTEE REPORT).
American Water Works Association, New York. Committee on Water Use.

Journal of the American Water Works Association, Vol 65, No 5, p 285-301, May, 1973. 2 fig, 2 tab, 1 ref.

Descriptors: Water resources development, *Water supply, *Water users, *Estimating, *Forecasting, Methodology, Evaluation, Analysis. Identifiers: Current trends, *Residential water.

Rapid urban development experienced in the past twenty years has imposed increasing demands on available water supply sources. Sound utility operations and development programs depend largely upon realistic forecasts of future requirements. Whether present indications of changes in trends are the result of temporary fluctuations or a more general, long-term leveling out of customer water requirements is a subject of increasing concern within the water industry. Results are presented studies which assess current trends in customer water use and factors studies which assess current trends in customer wate of influencing trends in order to assist in the projection of future water requirements. Water usage is generally expressed in terms of usage per customer. The study examines the nature of current water use trends or changes based on recent water-industry experience. Discussed are changes in climatological conditions, residential living patterns, established area occupancy and land use, and economic and business conditions. Part II reviews the 1966 Johns Hopkins University proposed method of estimating future residential water demand requirements for use in distribution-system analysis; its applicability as a practical method for use by utility managers and engineers in estimating future residential average and peak-flow requirements in individual communities is evaluated. Descriptors: *Droughts, *Water shortage, *Water allocation, *Management, Low-flow augmentation, Water demand, Water supply, Administration, Water releases, Water conservation, Planning, *Delaware River Basin Commission, Delaware River basin.

The drought that occurred in the northeastern United States from 1961 to 1967 and its effects in the Delaware River Basin are discussed. Because of the great demands for water in the Delaware River Basin (e.g. Philadelphia, New York City) the drought reached a crisis level in 1965 when New York City began to withhold water releases from its reservoirs in the headwaters of the basin. These downstream releases were required by a Supreme Court ruling and formula to preserve minimum flows in the river and maintain Philadelphia's water supply. When the formula proved to be unworkable the Delaware River Basin Commission stepped in and took on the role of arbitrator and water allocator. The Commission helped create a water bank plan, formulate flexible downstream release strategies, and ellicit cooperation from various private reservoirs to maintain minimum flows in the river. In addition, local governments initiated water conservation programs and agreements to share water supplies, the State of New Jersey took over temporary management of several reservoirs, and the federal government provided assistance. However, the key conclusion is that the Delaware River Basin Commission played a most significant role in terms of flexible management. (Elfers-North Carolina)

Descriptors: *Legal aspects, *Urban runoff, *Southwest U.S., *Arid lands, *Urbanization, Beneficial use, Watershed management, Floods, Water rights, Land use, Regulation, Banks, Flood plains, Condemnation, Parks, Easements, Financing, Zoning, Coordination, Storm drains, Diversion, Recreation facilities, Flood control, Legislation.
Identifiers: Tort liability, Litigation.

Pressure is being brought to bear on national resources of air, earth, and water in the growing cities in the arid Southwest. Legal questions involved in capturing urban runoff and putting it to a beneficial use are examined. Urbanization of a watershed results in a 3 to 5 fold increase in runoff amounts. Legal aspects include tort liability from floods, water rights to the increased flows, land use restrictions along banks and flood plains, condemnation of land for park development and flowage easements, financing problems, zoning applications, and coordination of governmental bodies responsible for parks, storm drainage and related services. Urban runoff is the most obvious legal problem in the tort liability area. It appears feasible to divert small quantities of water from urban wastes for recreational uses which provide flood control benefits. It appears that municipalities could appropriate increased flows caused by urbanization. The ultimate legal questions remain to be resolved by legislation, litigation or extension of the appropriative system. (See also W73-10818) (Popkin-Arizona)

VIRGINIA WATER POLICY: THE IMPRECISE MANDATE,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Water Resources Research Center.
W. R. Walker, and W. E. Cox.
William and Mary Law Review, Vol 14, No 2, p 312-325, Winter, 1972. OWRR B-025-VA (1).

Descriptors: *Water policy, *Water law, *Administrative agencies, Conservation, Erosion, Wetlands, Pollution, Riparian doctrine, *Virginia, *Management, *Planning, River basin development.
Identifiers: Virginia constitution, Legislative policy, Public interest, Water power, Scenic values.

An analysis of the principal sources of Virginia water policy indicates that each contains elements of a comprehensive policy statement but that no single source is adequate. The policy declaration broached in the State Constitution is in general terms only. The independent elements of state water policy enunciated by various legislative enactments are inconsistent. The legislative delegation of policy-making authority to several agencies has resulted in lack of coordination in policy and interagency conflicts. The state government traditionally has left the determination of individual water rights to the courts where the riparian doctrine has been interpreted and applied. Thus, the 'administration' of water rights and the establishment of related policy, has in large part been accomplished by the state courts rather than by the legislative or executive branches of government. The logical form for a comprehensive water policy to guide future water use appears to be a statutory enactment. The statement of water policy must recognize relationships between various aspects of water conservation and development, and it must manifest this recognition through coordination of existing policy elements.

MODEL FLOOD PLAIN ZONING ORDINANCE,
Mid-Ohio Regional Planning Commission, Columbus.
H. T. Merwin, T. Richardson, and R. J. Holland.
June, 1972. 34 p, 4 fig. HUD - Ohio P-289.

Descriptors: *Flood plain zoning, *Flood plains, Land use, Floodways, Planning, Legislation, *Ohio.
Identifiers: *Flood plain management, *Model ordinance, Flood hazard areas, Mid-Ohio Regional Planning Commission.

As a preface to the model ordinance, this report includes a discussion of the need for flood plain management, an explanation of some of the terms and administrative procedures involved in the ordinance, and the resolution of the Mid-Ohio Regional Planning Commission adopting the ordinance. The problems involved with urbanization of flood plains and the need for proper land use planning and flood plain management are emphasized. The MORPC intends to use the model ordinance to help communities in the planning area adopt and implement flood plain zoning. The model ordinance would establish flood plain districts, according to the determination of flood hazard areas, and define which land uses would be permitted and prohibited within the districts. The ordinance also provides for conditional uses via special permits, a board of adjustment, and appeals and hearings procedures. (Elfers-North Carolina)

In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 1-17 (1972), 3 fig, 5 tab, 2 ref.

Descriptors: *Colorado River, *Scenic highways, *Recreation demand, *Recreation facilities, *Psychological aspects, River Basin development, Public access, Public benefits, Analysis, River regulation, Decision making, Institutions, National Parks.
Identifiers: *Grand Canyon National Park and Monument, *Colorado River Outfitters Association.

Increased useer intensity of the Colorado River through Grand Canyon National Park and Monument required the National Park Service and the Colorado River Outfitters Association to adopt new policies to improve the quality of river trips and to protect the river. This study was undertaken to gain a greater awareness and understanding of visitor expectations, perceptions, interactions, satisfactions and dissatisfactions by analysis of response to a questionnaire mailed to a random sample of 2,622 past river runners from which a 65 percent return was received. Analysis of individual question tabulation and multivariate data-cluster analysis were performed. Users found crowding or user density to be at least tolerable. The largest group of runners were average in wilderness or other activities, and low relative to less strenuous activities. A large group of runners had relatively little experience in the wilderness. A large group of runners enjoyed the trip, desired more regulations, and were moderate about taking more trips. A large group rated the trip as a wilderness adventure which provided the opportunity to 'get away'. Cluster analysis is shown to be a useful tool of policy-making institutions. SOME RESULTS AND WAYS OF DEVELOPING METHODS OF STREAMFLOW MEASUREMENT IN MOUNTAIN COUNTRIES (NEKOTORYYE ITOGI I PUTI RAZVITIYA SPOSOBOV RASCHETA STOKA V USLOVIYAKH GORNYKH STRAN),
Sredneaziatskii Nauchno-Issledovatelskii Gidrometeorologicheskii Institut, Tashkent (USSR).
V. L. Shul'ts.
In: Vodnyy balans territorii Sredney Azii; Sredneaziatskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 62 (77), p 3-16, Leningrad, 1972.

Descriptors: *Analytical techniques, *Flow measurement, *Regions, *Mountains, Topography, Runoff.
Identifiers: USSR, Isolines.

Development of methods for measurement of mountain streamflow in the absence of data began in the USSR and abroad more than 35 years ago. The vast influence of topography on water supply and regime of mountain streams and the poor meteorological coverage of mountain regions have led to a search for relationships between many runoff characteristics and elements of the relief. For watersheds with small drainage areas (less than 100 sq km), nonclimatic factors and climatic anomalies must be considered. Assuming all conditions are observed, the method of isolines can and should be used. For mountain countries, the method of analogy may be complicated by absence of a common analog for all runoff characteristics and by remoteness of the analog from the river for which runoff characteristics are being defined. Improvements in river discharge measurement require: (1) development of empirical methods of computation of runoff characteristics; (2) study of runoff components and patterns of runoff distribution in area and time; and (3) development of theoretical methods of computation, including mathematical modeling. GUIDE TO SELECTING UNINTERRUPTIBLE POWER SYSTEMS.

Instruments and Control Systems, Vol. 46, No. 3, p 84-86, March 1973. 4 fig. 1 tab.

Descriptors: *Electrical equipment.
Identifiers: *Uninterruptible power systems, Power supplies.

The general characteristics of uninterruptible power systems are described. There are basically two systems: rotating power systems which employ flywheels to filter the effects of transients, maintain rotation after power failure, and start the auxiliary prime mover; and static systems which employ batteries and DC-to-AC converters. The

LIBRARY OF U. URBANA-CHAMPAIGN

advantages and disadvantages of the systems are described, and manufacturers are listed. (Little-Battelle)

A QUANTITATIVE PUSH-NET SYSTEM FOR TRANSECT STUDIES OF LARVAL FISH AND MACROZOOPLANKTON,
Hawaii Inst. of Marine Biology, Honolulu.
J. M. Miller.
Limnology and Oceanography, Vol 18, No 1, p 175-178, January 1973. 2 fig, 4 ref.

Descriptors: *Larvae, *Distribution patterns, *Zooplankton, *Fish, Water sampling, Equipment, Hawaii, Spatial distribution, Construction, Design, Invertebrates, Plankton nets, Surface waters.
Identifiers: *Macroinvertebrates, *Push-net sampling system, Pranesus insularum, Kaneoche Bay.

A surface plankton sampler that quantitatively samples contiguous segments of a transect has characteristics that include operability in shallow water by two investigators, paired, self-cleaning nets, a minimum of obstructions preceding the nets, and a high ratio of filtering area to mouth area. Flow through each net and the distance traveled are monitored and recorded continuously with modified TSK current meters. At a boat speed of about 3 mph (1.34 m/sec), a sample was obtained in 3 min from a 241-m segment of a 7.2-km transect in Kanehoe Bay (Oahu, Hawaii). At this operating speed, the combination of 505-micron Nitex nets and 333-micron Nitex bags yields fish larvae (2-25 mm) in good condition. Larvae of 92 species of fish (size range, 2-20 mm) have been taken with the gear from Kaneoche Bay over a one-year period. Total sampling time was less than 2 hr with this system. Using the sampling technique being described, small scale variations in the abundance of surface zooplankton can be detected. (Holoman-Battelle)

MODIFICATIONS OF THE BIRGE-EKMAN BOX CORER FOR USE WITH SCUBA OR DEEP SUBMERGENCE RESEARCH VESSELS,
Woods Hole Oceanographic Institution, Mass.
G. T. Rowe, and C. H. Clifford.
Limnology and Oceanography, Vol 18, No 1, p 172-175, January 1973. 1 fig, 1 tab, 7 ref.

Descriptors: *Sampling, *Equipment, *Scuba diving, Shallow water, Deep water, Construction, Design.
Identifiers: *Birge-Ekman box corer, *Research vessels, Precision.

The Birge-Ekman box corer has been modified for use by SCUBA divers or deep submergence research vessels, thus allowing control in the precision of sampling. Data suggest that the modified box corer exhibits greater accuracy and precision in estimating the abundance of species and individuals than conventional surface ship samplers or smaller corers used widely for in situ investigations. MEASUREMENT OF CURRENT AND POTENTIAL DISTRIBUTION AT ROTATING-DISK ELECTRODES,
Bell Telephone Labs., Inc., Murray Hill, N.J.
B. Miller, and M. I. Bellavance.
Journal of the Electrochemical Society, Vol 120, No 1, p 42-53, January 1973. 15 fig, 6 tab, 26 ref.

Descriptors: *Zeta potential, *Electric currents, *Measurement, Laboratory tests, Electrical resistance, Electrical properties, Instrumentation.
Identifiers: *Rotating disk electrode, *Current distribution, Collection efficiency, Potentiometry, Sensors.

Current distribution at the rotating disk electrode has been experimentally evaluated by several techniques including single and double reference probe potential mapping, ring-disk electrode collection efficiency and resistive interaction, interrupter and steady-state resistance measurements, and automatic ohmic compensation methods. Mapping experiments are in quantitative agreement with the predictions of Newman's theory for this system and were further confirmed by resistance determinations and theoretically based correction methods. The implications of the data for various ring-disk and nonsteady-state experiments and also the utility of an approximate approach to estimating the degree of nonuniform current distribution are examined. OPTIMUM SAMPLE SIZES FOR THE COMPARISON OF THE CONTROL AND TREATMENT,
National Cancer Inst., Bethesda, Md. Mathematical Statistics and Applied Mathematics Section.
J-M. Nam.
Biometrics, Vol 29, No 1, p 101-108, March 1973. 3 tab, 4 ref.

Descriptors: *Statistical methods, Sampling.
Identifiers: *Sample size determination, Method validation.

The optimum sample sizes for the control and treatment groups for testing the difference between average survival times are investigated when the costs of testing the two groups differ. Situations are considered where the test cost per subject is constant and independent of its survival time as well as where it is proportional to its survival time. The optimum sample sizes are greatly preferred over equal sample sizes when the difference between the cost for the control and that for the treatment is large. (Little-Battelle)

TWO INSTRUMENTS FOR ACTIVATION ANALYSIS OF SOLUTIONS BY A DILUTION METHOD,
Instituut voor Kernphysisch Onderzoek, Amsterdam (Netherlands).
P. W. F. Fouwrier, A. H. W. Aten, Jr., and J. Van Hooidonk.
International Journal of Applied Radiation and Isotopes, Vol 24, No 3, p 147-151, March 1973. 1 fig, 1 tab, 1 ref.

Descriptors: *Aqueous solutions, *Neutron activation analysis, *Laboratory equipment, Design.
Identifiers: *Sample preparation, Irradiation.

Two methods are described for the determination of the concentration of a main component in an aqueous solution by activation with a radioactive neutron source. The first method employs a rotating table with eight lucite vessels which contain the unknown and refernece samples. The neutron source is contained in a lucite plug filled with paraffin and positioned inthe center of the table. The second method employs a cylinder or sphere which contains the sample for activation. The neutron source is placed in the center for sample activation and then replaced by one or more counters for analysis. Corrections necessary for analysis by either method are given. The first technique has the advantage of using less material and of being less susceptible to disturbing influences due to impurities or differences in concentration. The second instrument is easier to obtain since it requires no special equipment except a neutron source, a counter, and glassware. (Little-Battelle)

American Univ., Washington, D.C.
C. J. Lynch.
Available from University Microfilms, 300 No. Zeeb Rd., Ann Arbor , Mich., 48106, Order No. 73-1350. Ph D Dissertation, 1972. 78 p.

Descriptors: *Statistical methods, *Regression analysis, Least squares method, Model studies.
Identifiers: Estimators, *Regression coefficients, *Incomplete observations, Monte Carlo method, Variance-covariance matrix, Mean square error, Variance, Bias, Data interpretation.

A method is presented for estimating coefficients of linear regressions when some observation data are missing at random. The linear model is given by Y sub t equals beta sub o plus beta sub 1 X sub t 1 plus ... plus beta sub PX sub tP plus e sub t, where the index t identifies the observation number and the e sub t are independent random disturbance terms with mean value O and (unknown) variance sigma squared. Coefficients are estimated for the conditional distribution of Y given fixed values of the X's. Observation data consist of vectors drawn from some unspecified multivariate population. Some observation vectors have components missing at random, but it is assumed that N of these vectors have at least one X value available. These N vectors are used for computing estimators of the regression coefficients. In the process of deriving these estimators, denoted by a s sub ij, missing data are approximated as regressands in least squares equations whose parameters are computed over the subset of complete observations. The s sub ij are then inserted in classical least squares formulas and estimators (consistent (C) estimators) of the parameters beta sub k, k equals O, 1, ..., P are derived. The asymptotic variance-covariance matrix of the C estimators is derived for the case of no missing dependent variables. Monte Carlo experiments were conducted to compare the C estimators to calssical least squares estimators based on the subset of complete observations and to Glasser's estimators, the only other published set of consistent estimators applicable to more than two non-random independent variables. The experiments were conducted for N equals 25 with P equals 3 and for N equals 40 with P equals 5. The sample mean-square-error and, separately, the absolute value of the sample bias were used as test criteria. The Monte Carlo experiments suggest that the C estimators retain their relative superiority over Glasser's estimators with respect to both mean-square-error and bias and over classical least squares with respect to mean-square-error for N equals 25 with P equals 3 and for N equals 40 with P equals 5. The

Monte Carlo experiments also suggest that the C estimators retain their relative superiority over classical least squares with respect to bias for N equals 40 with P equals 5, but the reverse is true for N equals 25 with P equals 3. (Holoman-Battelle)

SIDE-LOOK RADAR PROVIDES A NEW TOOL FOR TOPOGRAPHIC AND GEOLOGICAL SURVEYS,
Westinghouse Defense and Electronic Systems Center, Baltimore, Md.
R. E. Powers.
Westinghouse Eng., Vol 32, No 6, p 176-181, Nov 1972. 2 photo, 3 dwg.

Descriptors: *Geological surveys, *Geologic investigations, *Aerial photography, Mapping, Geologic mapping, Aerial surveys, Photogeology, Remote sensing, Surveying, Surveys, Terrain analysis, *Topographic mapping, Radar, Faults (Geologic).
Identifiers: *Radar images, Nicaragua, Resolution, Distortion (Optics), Vegetal cover.

Side-look radar (SLR) imagery is now being used for aerial mapping of large areas of the world. Geologists are beginning to recognize the SLR capability to display landforms and surface expressions of subsurface geological structures. In equatorial regions that are almost constantly covered with clouds, SLR penetrates the clouds, allowing mapping that would be difficult using aerial photography. In Ecuador, a drainage map produced by SLR imagery was superior to infrared photography methods often used. In the Southwestern US, SLR imagery located important geologic faults not visible from aerial photographs. In Nicaragua, obtaining SLR imagery for the entire country took 7 days, and 4 months later, comprehensive maps were prepared showing geology, geomorphology, surface drainage, generalized land use, and vegetation. SLR imagery is accomplished from an airplane by recording a television like picture one line at a time. The traversing cathoderay-tube trace varies in intensity as the returning signal amplitude varies. Resolution and distortion of SLR imagery are discussed. Possible future uses include updating maps and identifying surface materials. (USBR)

A system for collecting hydrologic data has the capability to operate unattended for long periods of time, reliably sensing and digitizing data at predetermined intervals for data transmission or storage. Little power is needed for system operation in the standby mode. Batteries supply the energy required for operation, so it can be used in remote places. Data are taken from a precipitation gage, temperature probe, wind direction indicator, wind sensor, and water-level sensor. The system is periodically actuated by a solid-state clock. The record is made on an 8-channel paper-tape punch. (Knapp-USGS)

60 GHZ RADIOMETRIC LOCAL VERTICAL SENSOR EXPERIMENT,
Westinghouse Defense and Electronic Systems Center, Baltimore, Md. Systems Development Div.
C. H. Grauling, Jr.
National Aeronautics and Space Administration Contractor Report NASA CR-2229, April 1973. 198 p, 102 fig, 11 tab, 47 ref, append. NASI-10131.

Descriptors: *Radiation, *Electromagnetic waves, *Remote sensing, *Satellites (Artificial), *Radio waves, Research and development, Atmosphere, Oxygen, Light intensity, Temperature, Model studies, Computer programs, Systems analysis, Instrumentation.
Identifiers: *Radiometric vertical sensor, Radiance profile.

Major results are summarized for spacecraft development of the Radiometric Local/Vertical Sensor Experiment. The experiment involves the use of millimeter wave radiation from the atmospheric oxygen to provide vertical sensing information to a satellite-borne radiometer. The radiance profile studies require the calculation of ray brightness temperature as a function of tangential altitude and atmosphere model, and the computer program developed for this purpose is discussed. Detailed calculations were made for a total of 12 atmosphere models, including some showing severe warming conditions. The experiment system analysis investigates the effect of various design choices on system behavior. Calculated temperature profiles are presented for a wide variety of frequencies, bandwidths, and atmosphere models. System performance is determined by the convolution of the brightness temperature and an assumed antenna pattern. A compensation scheme to account for different 'plateau' temperatures is developed and demonstrated. Curves of predicted system behavior are presented for many different atmosphere combinations, antenna pattern shapes, and antenna beamwidths. The millimeter wave components developed for the local vertical sensor are discussed, with emphasis on the antenna, low noise mixer, and solid-state local oscillator. A viable sensing technique exists, useful over a wide range of altitude with an accuracy generally in the order of 0.01 degree or better. (Woodard-USGS)

Descriptors: *Data collections, *Hydrologic data, *Statistical methods, Sampling, Data processing, Data storage and retrieval, Model studies, Stream gages, Gaging stations, Variability, Correlation analysis, *California.
Identifiers: Eel River Basin (Calif).

A method is presented for the delineation of optimal sampling frequencies in discrete data aquisition programs in the fields of hydrology and water resources. Statistical treatment and the implications of information content are discussed in terms of the variability of sample mean and sample variance. The method is illustrated with three streamflow gaging stations in the Eel River basin, California. The variation of information content with sampling interval yields guidelines for the choice of a sampling frequency such that persistence effects and the consequent redundancy of information are minimized. WATER RESOURCES INVESTIGATIONS IN NORTH DAKOTA, 1972.
Geological Survey, Washington, D.C.

Report of Investigations Folder, 1973. 1 sheet, 7 fig, 1 map.

Descriptors: Water resources, Investigations, *Inter-agency cooperation, *North Dakota, *Surveys, Planning, Hydrologic data, Basic data collections, Precipitation (Atmospheric), Groundwater, Water quality, On-site investigations, Dissolved solids, Water level fluctuations, Bibliographies, Networks, *Maps, Streamflow.
Identifiers: *Cooperative water-studies program, Research projects.

Water-resources studies and investigations in North Dakota made by the U.S. Geological Survey in cooperation with State and local agencies are summarized. A bibliography of selected material concerning these investigations is included. The investigations include collections of basic information through a hydrologic data network, areal hydrologic or interpretive studies, and research projects. The hydrologic data network consists of primary, secondary, and water management streamflow stations; groundwater observation wells; and water quality observation sites. Small State maps show principal sources of groundwater, average annual precipitation, discharge of the principal rivers, and the dissolved solids in surface waters. A map, scale 50 miles to the inch, shows by symbols, numbers, and colored outline the hydrologic data network and investigations in progress as of November 1972. (Woodard-USGS)

RECONNAISSANCE OF THE MANISTEE RIVER, A COLD-WATER RIVER IN THE NORTHWESTERN PART OF MICHIGAN'S SOUTHERN PENINSULA,
Geological Survey, Washington, D.C.
G. E. Hendrickson, and C. J. Doonan.
Geological Survey Hydrologic Investigations Atlas HA-436, 1972. 2 sheets, 15 fig, 5 ref.

Descriptors: *Hydrologic data, *Streamflow, *Water quality, *Michigan, Water properties, Data collections, Recreation facilities, Cold-water fishing, Trout, Stream gages, Flow measurement, Water yield, Water analysis, Chemical analysis, *Maps, Curves, Geology, Groundwater movement, Base flow.
Identifiers: *Manistee River (Mich).

The Manistee River is one of Michigan's well-known trout streams because of its numerous public access sites and campgrounds. The recreational values of the Manistee depend on its characteristics of streamflow, water quality, and bed and banks. This atlas describes these characteristics and shows how they relate to recreational use. The Manistee River basin above Smithville drains an area of about 500 square miles. More than half of this area is outwash plains underlain by permeable soils and glacial drift. The rest of the basin is chiefly rolling to hilly, topography characteristic of glacial moraines. The large component of groundwater flow makes the Manistee a stable stream with relatively small fluctuations in discharge and stage. The average monthly discharge in cfsm at the Grayling gage ranges from 1.37 in April to 1.07 in August. This is the smallest variation in monthly discharge recorded for any stream in Michigan's southern peninsula. The water is of the calcium-bicarbonate type, moderately hard, and low in sulfates and chlorides. (Woodard-USGS)

WATER-TEMPERATURE DATA ACQUISITION ACTIVITIES IN THE UNITED STATES,
Geological Survey, Washington, D.C. Office of Water Data Coordination.
F. H. Pauszek.
Available from NTIS, Springfield, Va 22151. PB-213 972. Price $3.00 printed copy; $0.95 microfiche. Geological Survey Water-Resources Investigations 2-72, 1972. 47 p, 16 fig, 8 tab, 92 ref.

Descriptors: *Water temperatures, *Surface waters, *Groundwater, *United States, Sites, Federal government, Data collections, Measurement, Streams, Rivers, Lakes, Reservoirs, Estuaries, Water wells, Springs, Reviews, Information retrieval.
Identifiers: *Water-temperature measuring sites (US).

Information on water-temperature measuring sites in the United States is presented by means of tables and illustrations preceded by brief explanations. Included are the agencies collecting the data, the number of stations located on surface waters and groundwaters where temperature measurements are made, the distribution of stations by states and by the 21 regions of the Water Resources Council (WRC), a federal agency created in accordance with the Water Resources Planning Act of 1965, and the frequency of measurements. The report does not contain the actual temperature data. A bibliography lists 194 references which contain temperature data. (Woodard-USGS)

A TEST OF EQUALITY OF MEANS OF CORRELATED VARIATES WITH MISSING DATA ON ONE RESPONSE,
Pennsylvania Univ., Philadelphia.
D. F. Morrison.
Biometrika, Vol 60, No 1, p 101-105, April 1973. 1 tab, 5 ref.

Descriptors: *Statistical methods.
Identifiers: *Hypothesis testing, *Missing data, Testing, Paired t statistics, Mean values.

A statistic is proposed for testing the hypothesis of equality of the means of a bivariate normal distribution with unknown common variance and correlation coefficient when observations are missing at random on one of the variates. Expressions for the second and fourth moments of the statistic have been obtained, and normal, t and Cornish-Fisher approximations to the percentage points under the null hypothesis have been found from them. The expected squared lengths of the confidence intervals for the mean difference have been used to measure the additional sensitivity of the test over that of the conventional paired t. (Little-Battelle)

A TWO-SAMPLE PROCEDURE FOR SELECTING THE POPULATION WITH THE LARGEST MEAN FROM SEVERAL NORMAL POPULATIONS WITH UNKNOWN VARIANCES,
Bath Univ. of Technology (England).
J. B. Ofosu.
Biometrika, Vol 60, No 1, p 117-124, April 1973. 5 tab, 7 ref.

Descriptors: Statistical methods.
Identifiers: *Two-sample procedure, *Mean values, Best normal population.

A two-sample procedure is described for selecting the population with the largest mean from k normal populations with unknown variances. The method is based on a two-sample procedure proposed by Stein (1945). Tables necessary for the application of the procedure are given for selected values of k. Comparisons of the minimum values of the expected sample sizes using the proposed procedure are made with the corresponding single-sample sizes for known variances (Bechhofer, 1954). Comparisons are also made of the expected total sample sizes for the single-sample procedure, the two-sample procedure given and the two-sample procedure proposed by Bechhofer, Dunnett and Sobel (1954) which assumes that the populations have known variance ratios. The expected total sample sizes are not much increased by ignorance of the variance ratios. (Little-Battelle)

THROUGH THE MINI MAZE,
Interdata, Inc., Oceanport, N.J.
J. Folts.
Automation, Vol 20, No 2, p 44-48, February 1973. 3 fig.

Descriptors: *Data collections, *Real costs, *Monitoring, *Data processing, Equipment, Water pollution, Automatic control, Design criteria, Industrial production, Methodology, Cost analysis, Automation, Instrumentation, Specifications.
Identifiers: *Minicomputers, Performance evaluation.

A discussion is presented which represents an effort to give those researchers interested in using minicomputers some idea of the real costs of mini systems and the hidden pitfalls of minicomputer application. The applications considered are those in which (1) no changes are made in the mini system without first taking it off-line; (2) multifunctional tasks are considered and the application programs are altered or replaced while the system is still on-line; and (3) multifunctional tasks involve incorporating on-line interaction with terminals and the ability to change application programs while simultaneously performing background computations. Extensive record-keeping and summary report generation is also involved. Three classes of machines that will provide the 'computer horsepower' to perform the above tasks are described and assessed on the basis of costs and performance. In addition, the pitfalls of system design are discussed. (Holoman-Battelle)
W73-11015

AN ESTIMATOR FOR THE SIZE OF AN ANIMAL POPULATION,
Birkbeck Coll., London (England).
P. Holgate.
Biometrika, Vol 60, No 1, p 135-140, April 1973. 7 ref.

Descriptors: *Statistical methods, *Animal populations, *Estimating, Age, Mortality.
Identifiers: *Data interpretation, Bias, Variance.

A method of estimating animal populations which is popular among zoologists is to take the total of the ages of animals that die during a given year as an estimator of population size. In this note the bias and variance of the estimator are investigated

FOCUS ON A/D AND D/A CONVERTERS,
D. N. Kaye.
Electronic Design, Vol 21, No 1, p 56-65, January 4, 1973. 4 fig.

Descriptors: *Automatic control, *Specifications, *Design data, *Data collections, Electrical equipment, Instrumentation, Design criteria, Automation, Electrical converters, Performance.
Identifiers: *Analog-to-digital converters, *Digital-to-analog converters, Accuracy, Weighted-resistor d/a converters, R-2R d/a converters, Dual-slope integration a/d converters, Successive approximation a/d converters.

Analog-to-digital and digital-to-analog converters are discussed in reference to their circuitry, modes of operation, and other specifications. The vast majority of d/a converters on the market today use two basic circuits: the weight-resistor network and the R-2R configuration. These two types are most conveniently described for the case of a voltage-output d/a--that is, the case where a digital input yields a discrete voltage level at the output. As with d/a converters, the vast majority of a/d converters on the market comprise two basic types: the dual-slope integration a/d converter and the successive approximation a/d converter. Each takes a voltage input and puts out a digital code proportional to the input voltage. A/d specifications are similar to d/a specifications, a main difference being the output of a series of digital codes by an a/d converter. Manufacturers of converters of various specifications and costs are listed. (Holoman-Battelle)

DIGITAL-TO-ANALOG CONVERTER HAVING COMMON-MODE ISOLATION AND DIFFERENTIAL OUTPUT,
IBM General Systems Div. Lab., Boca Raton, Fla.
G. A. Hellwarth, and S. Boinodiris.
IBM Journal of Research and Development, Vol 17, No 1, p 54-60, January 1973. 7 fig, 1 tab, 8 ref.

Descriptors: *Automatic control, *Data collections, *Data processing, Instrumentation, Data storage and retrival, Electrical properties, Electrical equipment, Computers, Automation, Electric converters, Electrical networks, Electrical impedance, Direct currents.
Identifiers: *Digital-to-analog converters, *Common-mode isolation, *Differential output, Performance evaluation, Accuracy, Noise (Electronics), Noise (Environmental).

A digital-to-analog converter (DAC) is described that has transformer-coupled isolation for both power and data inputs and provides a true differential output. The DAC provides a 10-bit, 10.23-V unipolar output of either polarity, depending on which of the two output lines is used as the load reference potential. The common mode potential may be as large as 250 V, and below 120 Hz the common-mode rejection typically exceeds 100 dB. The isolated, balanced circuit eliminates environmental noise problems and permits long cabling lengths without loss of dc accuracy. The DAC is an analog output feature available on the IBM System/7, a small computer designed for data acquisition and real-time automation applications. (Holoman-Battelle)

THE SAN FERNANDO EARTHQUAKE: A LESSON IN HIGHWAY AND BRIDGE DESIGN,
California State Div. of Highways, Sacramento.
A. L. Elliott.
Civ Eng, Vol 42, No 9, p 95-97, Sept 1972. 1 fig, 6 photo.

Descriptors: *Bridge design, *Bridge failure, Joints (Connections), Earthquakes, Bridges, Earthquake engineering, Seismic design, Structural design, Seismology, Seismographs, Columns, Reinforced concrete, *California.
Identifiers: *San Fernando earthquake, *Highway bridges, Earthquake damage, *Earthquake-resistant structures.

In the San Fernando Valley of California, on February 9, 1971, an earthquake destroyed many earthquake-resistant structures in just 12 seconds. With many recording instruments in the area, engineers were able to learn the structural reactions to earthquake forces. Most obvious was that structures located in the disruptive center are inevitably subject to severe structural damage. Designing to prevent all damage is neither feasible nor economical, but sound designs should be used to prevent total collapse of the structure. Remedies for 6 structural weaknesses are discussed. Recommended design modifications are: (1) concrete columns with heavier and closer spaced continuous spiral reinforcing; (2) expansion joints with restraints for large movements; (3) no lap splices in main column bays for columns less than 30 ft high; (4) better anchorage of piles in footings; (5) better keying and lateral restraint at abutments; and (6) dynamic analysis that considers earthquake motion, structural response, and foundation materials. (USBR)

RAW WATER TRANSMISSION SYSTEM FOR SPRINGFIELD, MASS.,
Hazen and Sawyer, New York.
W. B. Sinnott, and S. S. W. Yuan.
Transportation Engineering Journal, Proceedings of the American Society of Civil Engineers, Vol 97, No TE3, p 459-467, August, 1971. 9 fig, 1 tab, 5 ref, 1 append.

Descriptors: *Water supply, *Water conveyance, Project planning, *Hydraulic design, Computer models, Simulation analysis, *Massachusetts, *Reservoirs.
Identifiers: *Springfield (Mass), Waterhammer, Cobble Mountain Reservoir, Littlefield Reservoir.

Because of the drought in the northeastern United States during 1961-1966, many cities began looking for additional sources of water supply. The City of Springfield decided to use water available in a new reservoir constructed by the Army Corps of Engineers (for flood control purposes) and to divert this water, about 60 mgd, to the city's Cobble Mountain Reservoir. The article focuses on the design of the water conveyance system between the two reservoirs. A particular problem involved in the operation of the system was waterhammer transients (pressure in the pipes) due to the length of the lines and the great amount of pumping involved. Computer simulations and field tests aided in determining an optimal system of values to control the waterhammer transients. (Elfers-North Carolina)

NEW ACOUSTIC TOOL LOGS CASED HOLES,
Pan Geo Atlas Corp., Houston, Tex.
D. M. Muir, and W. A. Zoeller.
Oil and Gas Journal, Vol 65, No 43, p 106-112, October 23, 1967. 10 fig.

Descriptors: Boreholes, Well casing, *Logging (Recording), Cement grouting, Grouting, *Nuclear moisture meters, *Acoustics, Wells, Texas, Velocity.
Identifiers: Formation evaluation, Formation-travel (Sound) times.

An improved acoustic tool is described which makes it possible to obtain porosity and lithology data from cased wells, while at the same time making it possible to evaluate the cement condition from the data recorded. In most situations, no more than 40 to 50% cement bond is required for accurate recording of formation - travel times. Under certain fast-velocity-formation conditions, accurate time logs have been obtained with an even smaller percentage of bonding. The equipment permits simultaneous recording of the acoustic, gamma ray, neutron, caliper, and collar logs. The acoustic tool is primarily a transmitting transducer positioned above two or more receiving transducers. The formation signal consisting of time and amplitude, is recorded in travel time by use of a complex measuring. The epithermal-neutron tool's response is a measure of hydrogen present within the investigated section. Neutron charts are available for determining porosity using different annulus vs. casing sizes. Logs for the three main conditions which may exist in a borehole after cementing are shown. (Campbell-NWWA)

SURFACE-HOLE TECHNIQUES SHOULD BE SIMPLE AND CHEAP,
Oklahoma Univ., Norman.
P. L. Moore.
Oil and Gas Journal, Vol 66, No 47, p 173, 176, 179, November 18, 1968. 2 fig.

Descriptors: Drilling, *Rotary drilling, Drilling fluids, Drilling equipment, Bentonite, Florculation, Costs, *Economic justification, *Exploration, Oil industry, Offshore platforms.
Identifiers: Drilling rates.

The reduction of drilling costs has become a major issue in the oil and gas exploration industry. This has been caused by the finding of new reserves in difficult-to-drill areas, such as permafrost, rough sea, and very deep localities. Generally, the best drilling practices are those where simplicity is emphasized. Several rules-of-thumb having general application to surface hole techniques are: (1) If more lift is needed, flocculate the mud; (2) Do not use chemical thinners, because they reduce lift capacity; (3) Don't worry about water-loss control; (4) Keep mud weights low--at least below 9.5 lb/gal and preferably 9.0 lb/gal or below; (5) Don't use high-priced thickening agents. Hole enlargement in the surface hole is a common problem, as are torque and formation-heaving problems. The remedy is to increase lifting capacity of the drilling fluid by increasing the viscous properties of the mud, or to slow down drilling. (Smith-NWWA)

HOW CONDITIONS AFFECT REACTION RATE OF WELL-TREATING ACIDS,
Marathon Oil Co., Denver, Colo.
H. K. Van Poolen, and J. R. Jargon.
Oil and Gas Journal, Vol 66, No 43, p 84-91, Oct 21, 1968. 15 fig, 1 tab, 24 ref.

Descriptors: *Acids, Acidity, Limestones, Dolomite, Calcium carbonate, *Carbonates, Calcium chloride, Temperature, *Chemical reactions, Pressure, Carbon dioxide, Hydrogen ion concentration.
Identifiers: *Acidizing, Weak acids, Hydrochloric acid, Buffers, Common ion effect, *Reaction rate.

The velocity of the chemical reaction which occurs during an acid treatment determines, to a great extent, the rate at which the acid should be pumped into the formation. Factors which influence the reaction rate–type of acid, formation composition and structure, pressure, temperature, acid concentration, acid velocity, and the formation of secondary products–are studied. The discussion is limited to limestone and dolomite, although some carbonate-cemented sandstone also responds to acid treatment. The reaction rate of calcium carbonate and HCl is reduced by the common ion effect as explained in an accompanying table. 'Weak acids', such as acetic, formic, benzoic, and lactic acids, are sometimes used in order to slow reaction rate. The partial neutralization of a weak acid forms a buffer solution which prevents a too-rapid rise in pH from occurring. Equalization of the reaction rates between HCl and limestone and HCl and dolomite is discussed. (Campbell-NWWA)

WELL OPERATION,
Madison Water Utility, Wis.
L. M. Nelson.
Journal of the American Water Works Association, Vol 62, No 7, p 436-438, July 1970.

Descriptors: Wells, *Water wells, Municipal water, Groundwater, *Well data, Pumps, *Water supply, Water sampling, Chlorination, Disinfection, Specific capacity, Drawdown, *Maintenance, Hardness (Water), Chemical analysis.
Identifiers: Submersible pumps, Turbine pumps, *Records.

In the operation of wells, a number of factors are involved to maintain a pure and adequate water supply. A durable water-tight casing should line the well to a depth of the first impervious rock formation. The well water should be continually checked by means of water sampling to insure freedom from bacterial contamination. If samples show no signs of bacterial contamination the water is safe for public use; if the samples indicate pollution, disinfection with chlorine should be used and, if repeated, a search made for the source of contamination. Selection and maintenance of well pumping equipment is another factor. Submersibles and deep-well turbine pumps are the two types generally used in deepwell application. Before a pump can intelligently be selected for any installation, it is necessary that accurate information by available with regard to required capacity, operating conditions and total head. Another factor in well operation is the keeping of good well water supply records. Daily, monthly, and yearly records should be kept of static levels, drawdown, pumping levels, specific capacity, gallons per minute, hours of operation, kilowatt hours and amount of chemicals fed. (Smith-NWWA)

CONTROLLING FLOWING ARTESIAN WELLS,
Bureau of Reclamation, Denver, Colo. Div. of Drainage and Groundwater Engineering.
T. P. Ahrens.
Water Well Journal, Vol 23, No 3, p 18-19, March 1969. 1 fig.

Descriptors: Wells, Water wells, *Artesian wells, Artesian heads, *Cement grouting, Drilling fluids, Bentonite, Grouting, Well casing, Slurries.
Identifiers: Annular space, Well packers, *Flowing artesian wells, Ontario.

A number of methods are available to control artesian flows which occur after a well is drilled. Factors determining which method is to be used are: stratigraphy of the area; depth, diameter, and design of the well, including location of perforations; method of construction of the well; and pressures and volumes of flow encountered. A procedure for controlling three Canadian wells is outlined. Basically, the method consists of using a bentonite mud to temporarily completely shut off the flow of water in both casing and annular space, and then displacing the mud with cement from the bottom by means of a perforated drop pipe. It is emphasized that all equipment and materials should be assembled at the work site in order that the cement be placed before the mud gels. If the mud gels, higher pumping pressures are required for displacement of the mud. Although not inexpensive, this procedure should be cheaper than drilling a new well. (Campbell-NWWA)

ACIDIZING BOREHOLES,
A. H. Stow, and L. Renner.
Journal of the Institution of Water Engineers, Vol 19, No 8, p 557-572, November, 1965. 1 fig, 5 append.

Descriptors: Wells, Water wells, *Acids, Carbonates, *Carbonate rocks, Sandstones, *Boreholes, Phosphorus compounds, Inhibitors, Grouting, Cement grouting, Limestone, Drilling.
Identifiers: Chalks, *Acidizing, *Development (Wells), Hydrochloric acid, Acetic acid, Phosphoric acid, Nitric acid.

Acid may be used in water well work to (1) Remove debris (from drilling) from test-pump discharge; (2) Remove slurry from the walls of a well or borehole, and to clear fissures at their entry into the well or borehole; (3) Develop and increase the yield; (4) Reduce friction loss to give more economic pumping. The reaction of acids with carbonates may be used to develop and to increase the yield of both carbonates and some (carbonate-cemented) sandstones. In considering the acidizing of a borehole, the following information is required: Dimensions of the borehole, depth to static water level, depth of grouted lining, details of overburden, geological description of exposed strata, yield and direction and velocity of groundwater flow, positions of boreholes within a 1/2 mile radius, and facilities for disposal of test-pumping water. Inhibitors and placement procedure are discussed; various acids and their properties are given in appendices. (Campbell-NWWA)

EFFICIENCY OF VARIOUS METHODS OF DRILLING WELLS FOR WATER SUPPLY,
A. G. Danilov, A. M. Danilov, and V. I. Kovalev.
National Water Wells Association Translation. Trans. from Gidrotekhnika i Melioratsiya, p 91-95, February, 1973. 2 fig, 3 ref.

Descriptors: Wells, *Water wells, Drilling, *Drilling equipment, Drilling fluids, Drilling samples, *Rotary drilling, Unconsolidated aquifers, Hydrogeology, Exploration.
Identifiers: *Cable-tool drilling, USSR.

In drilling for water, the yields (water yield measured in gpm/ft. of drawdown) of wells drilled by the cable tool method were 4 - 10 times greater than the yields of those drilled by the rotary method. The rotary method showed a drilling rate (meters/machine-month) only 2.5 - 3.0 times higher than that with cable tools. In detailed hydrogeological exploration for defining the problems in obtaining a water supply for irrigation and drainage in districts where the aquifer is unconsolidated and fragmentary (river valleys, foothills, interfluves, etc.) the cable tool method is economical and ensures a high quality of hydrogeological information and a large well yield. In hydrologically well-explored districts where the aquifers lie at depths of from 300-800 meters and have high artesian pressures the rotary method should be applied. (Smith-NWWA)
W73-10789

WELL STIMULATION--HOW ACIDS BEHAVE IN SOLUTION,
Marathon Oil Co., Tex.
H. K. VanPoolen.
Oil and Gas Journal, Vol 65, No 39, p 100-102, September 25, 1967. 1 tab, 2 ref.

Descriptors: *Acids, Oil industry, Wells, Ions, *Ionization, Calcium chloride, Calcium sulfate, Iron, Aluminum, Sodium compounds, *Chemical precipitation, Chemical reactions, Equations, Equilibrium, *Hydrogen ion concentration.
Identifiers: Sequestering agents, Weak acids, Buffered solutions, Hydrochloric acid.

Problems and solutions of acidizing boreholes to increase yield are given. The pH of solutions in general and of weak acid solutions is explained, along with why careful pH control is sometimes very important. Secondary precipitation, the dissolution of certain substrances in fresh acid and precipitation of these materials when the acid becomes spent, is explained, and substances which may give trouble in this regard are listed. The use of buffers to prevent the pH of a solution from rising above a critical value causing the secondard precipitation of iron or aluminum is outlined. Another approach to the problem of secondary precipitation, with calcium sulfate, is the prevention of the initial dissolution of calcium by the common ion effect. The control of secondary precipitation may also be accomplished by reduction of the cation concentation below the level necessary to cause precipitation. This is accomplished by the use of a sequestering agent which, for calcium sulfate, is sodium hexametaphosphate. (Smith-NWWA)

WELL DRILLING IN SOUTHEAST ASIA,
Camp, Dresser and McKee, Boston, Mass.
R. E. Preble.
New England Water Works Association Journal, Vol 85, No 2, p 132-138, (1971). 2 fig.

Descriptors: Wells, Water wells, Drilling, *Drilling equipment, *Asia, Rotary drilling, History, Groundwater, *Groundwater availability, Deltas, Unconsolidated aquifers.
Identifiers: *Developing countries, Cable tool drilling, Reverse-circulation rotary, Manual labor.

Problems related to groundwater development in Asia include (1) Scarcity of basic geological information for planning; (2) Insufficient number of qualified professionals; (3) Inadequate road network; and (4) Shortage of parts and supplies for drill rigs and accessories. Although in recent years most countries of S. E. Asia have started to employ modern equipment and techniques, many

wells today are still being installed by centuries-old hand methods. Methods of well drilling without power-driven equipment are explained in detail. Success of hand methods depends upon conditions encountered. The reverse rotary process is the ideal power operated method of drilling wells in flat deltaic areas of the region's major rivers. In developing countries, standard size wells are generally constructed with the same screen diameter regardless of the desired pumping rate. Often, this leads to excessive drawdowns and unnecessary power costs. (Smith-NWWA)

DRILLING FOR WATER IN NEW ENGLAND,
Geological Survey, Montpelier, Vt.
A. L. Hodges, Jr.
New England Water Works Association Journal, Vol 82, No 4, p 287-315, December, 1968. 10 ref.

Descriptors: Wells, Water wells, *Drilling, Drilling equipment, Unconsolidated aquifers, Rotary drilling, Well casings, Wells screens, Groundwater, *Groundwater availability, *Water supply development, Water table aquifers, Deep wells, Pumps, Gravels, *Northeast U.S.
Identifiers: Rock wells, Crystalline rocks, Sedimentary rocks, *Yields of wells, Well development.

The down-the-hole hammer, or rotary percussion method of drilling has gained rapid acceptance in New England since its inception in the 1950's and today supplements to a great extent the older cable tool method. Test drilling as a method for choosing the best location for a water well is recommended. The relative advantages and disadvantages of unconsolidated and consolidated aquifers, where both types are available, are given. Types of hole excavation for wells covered include dug wells, driven wells, jetted wells, bored wells, infiltration galleries, well fields of the aforementioned, and drilled wells constructed by various methods. Methods of casing and screen emplacement covered include the retracted-casing method, the baildown method, and the washdown method. Gravel packing is discussed in detail. A summary of yields of wells in various rock types is given. Well development methods, including overpumping, surging, dry ice, compressed air, and horizontal jetting, are discussed. A section on water well pumps includes discussions on pump types and pump selection. (Campbell-NWWA)
W73-10796

WELL DEVELOPMENT OF SAND AND GRAVEL AQUIFERS,
D. Ault, and R. N. Bethart.
Water Well Journal, Vol 23, No 3, p 20-22, March, 1969. 2 fig.

Descriptors: Groundwater, Gravels, *Unconsolidated aquifers, Well screens, *Particle size, Sand aquifers, Acids, Pumping, Jets, Wells, *Water wells.
Identifiers: *Well development, Bridging (Particles), Compressed air.

Differing methods of development of sand and gravel aquifers are presented, each having its advantages and disadvantages. Acid treatment is today often used in initial well development procedures and will clean up the formation for a considerable distance outside the well screen. A solution of either dry or wet acid is prepared and introduced into the well, agitated several times during a 12 to 24 hour soaking period, and is flushed out thoroughly by pumping the well. Overpumping, or the pumping of a well at a higher capacity than that of the permanent pump, often works very well on large capacity wells, especially when used in conjunction with other well development methods. The use of compressed air is the best method under certain conditions, but it requires the use of considerable equipment. A number of variations have been used when developing by air. Probably the most effective over-all method of well developing, however, is using water in a jet washing tool, which consists of directing high velocity streams of water at right angles into the formation. (Smith-NWWA)

GROUNDWATER WELLS SERVE MINING INDUSTRY,
Universal Oil Products, St. Paul, Minn. Johnson Div.
G. F. Briggs.
Industrial Water Engineering, Vol 6, No 7, p 22-25, July, 1969. 4 fig.

Descriptors: Wells, Water wells, Mine water, *Mineral industry, *Dewatering, *Leaching, Kaolinite, *Georgia, Mineral water, Brines, Chlorides, Magnesium, Magnesium compounds, Well screens, Drawdown, Alloys, Corrosion, Transmissivity.
Identifiers: Nitric acid, Uranium ore, *Ore bodies.

Lowering the water table over an area to be excavated as an open pit involves creating a composite cone of depression by pumping from a series of properly spaced wells. An example of application of this technique is given in a Georgia kaolin mining pit dewatering project. Six dewatering wells were used, each pumping about 3,000 gpm, in order to lower the water table 55 to 60 ft. over an area 2500 ft by 600 ft. Inplace leaching of uranium ore is also discussed as another area in which ground water technology can be useful in the mining industry. A cold nitric acid solution containing an oxidant and flocculant is injected into the ore zone through injection wells located around a central recovery well. As the leaching solution is put into the injection wells, a cone-shaped, fluid-pressure mound builds up in the porous medium around each well. Pumping from the recovery well is done at a rate equal to the total input of leach solution. This type of well application, of course, requires casing and screen materials which are highly corrosion resistant. An example where the mineralized formation water itself was a raw material--in this case 11 to 12% magnesium chloride--is also given. (Smith-NWWA)

DIVIDING FLOW IN CLOSED CONDUITS,
Beck (R. W.) and Associates, Seattle, Wash.
J. V. Williamson, and T. J. Rhone.
Paper, ASCE Natl Water Resour Eng Meet, Phoenix, Ariz, Jan 1971. 39 p, 14 fig, 26 ref, 2 append.

Descriptors: *Head loss, Friction, Prototype tests, Energy loss, Velocity, *Closed conduits, Pressure conduits, Hydraulic models, Hydraulic design, *Hydraulic conduits, Reynolds number, Flow resistance, Bibliographies, Research and development, Penstocks.
Identifiers: Experimental models, *Wye Branches.

The paper constitutes a progress report by the ASCE Task Committee on Branching Conduits. A historical review of many investigations and general experiments on energy losses for dividing flow in hydraulic conduits is presented with extensive analyses. Laboratory research studies are compared for symmetrical wye branches, manifolds, and standard and tapered branches. Special shapes are discussed. New designs by Escher Wyss and Krupp are described, and the results of field and laboratory studies are presented. The studies show that losses for 45- and 60-deg branches are not greatly different, but are less than for 90 deg. As the diameter ratio decreases, losses increase, but not significantly. Losses for conical wyes are generally less than those in single laterals. An internal tie rod or a spherical junction causes large losses it special inserts are not used to improve hydraulic efficiency. The angle of a conical transition should be between 10 and 15 deg for least loss. Prototype head losses are likely to be less than those obtained in model studies. (USBR)

GUIDELINES FOR HYDRAULIC CONSIDERATIONS IN HIGHWAY PLANNING AND LOCATION.
American Association of State Highway Officials, Washington, D.C. Operating Subcommittee on Roadway Design.

American Association of State Highway Officials Publication, 1973. 4 p, 2 ref. Highway Drainage Guidelines: Vol. I.

Descriptors: *Road construction, *Road design, *Hydrologic aspects, *Hydrology, *Design criteria, Highways, Streams, Data collections, Hydrologic data, Floods, Flood frequency, Topography, Geology, Drainage effects, Vegetation, Mapping, Aerial photography, Land use, Reviews, Planning.
Identifiers: Guidelines, Highway locations.

Water and related climatic factors are important considerations in planning and locating highways. The effect of the highway construction on the existing drainage pattern and on the potential flood hazard, as well as the effect of floods on the highway, must be assessed in the preliminary planning and design stages. Often hydraulic factors are closely related to the environmental, ecological and economic aspects of the location of a new highway and critical evaluations must be made in the planning process, requiring compromises and a searching for alternate solutions and routes. Some drainage, flood, and water quality problems can be easily recognized and resolved; others may require extensive investigation before an adequate and satisfactory solution can be developed. Specialists experienced in hydrology and hydraulics can contribute substantially to the planning and location of a highway project by recognizing potentially troublesome locations, making necessary investigations, and recommending practical solutions. Hydrologic and hydraulic data, preliminary calculations and analyses, all information used in developing conclusions and recommendations related to drainage requirements, including estimates of structure size and location, should be compiled in a report. Such a report serves as documentation and back up for decisions on route location and is an excellent reference for more detailed studies needed in preparing construction plans. GUIDELINES FOR HYDROLOGY.
American Association of State Highway Officials, Washington, D.C. Operating Subcommittee on Roadway Design,

American Association of State Highway Officials Publication, 1973. 23 p, 2 fig, 1 tab, 45 ref. Highway Drainage Guidelines, Vol 2.

Descriptors: *Road construction, *Road design, *Hydrologic aspects, *Hydrology, *Design criteria, Highways, Data collections, Streams,

Floods, Flood frequency, Topography, Geology, Drainage effects, Vegetation, Mapping, Aerial photography, Hydrologic data, Land use, Reviews, Planning.
Identifiers: Guidelines, Highway locations.

Hydrologic analysis is a most important step prior to the hydraulic design of a highway drainage structure. Such an analysis is necessary for determining the rate of flow, runoff, or discharge that the drainage facility will be required to accommodate. The design discharge is a hydraulic load on the highway facility and the determination of the proper structural load. These guidelines give a recommended approach to the hydrologic analysis for the design of highway drainage facilities. Highway drainage facilities range from very small culverts and channels to multimillion dollar storm drains and bridges. Although some hydrologic analysis is necessary for all highway drainage facilities, the extent of such studies should be commensurate with the importance of the structure. The documentation of a hydrologic analysis is the compiliation and preservation of all pertinent information on which the hydrologic decision was based. This might include drainage area and other maps, field-survey information, source references, photographs, hydrologic calculations, flood-frequency analyses, stage-discharge data and flood history, which includes narratives from highway maintenance foremen and local residents who witnessed or had knowledge of an unusual event. THE HEALTH AND CARE OF WELLS,
Universal Oil Products, St. Paul, Minn. Johnson Div.
R. L. Schreurs.
Journal of the American Water Works Association, Vol 62, No 7, p 434-436, July, 1970. 2 fig, 4 ref.

Descriptors: Wells, *Water wells, Groundwater, Well data, Well spacing, Iron bacteria, Iron oxides, Well screens, Graphical analysis, *Maintenance, Drawdown, Observation wells, Water levels, *Water level fluctuations, Pumping.
Identifiers: Incrustation, *Record keeping, Well yield, Pumping levels.

The longevity of a well depends on various factors--care used in construction, materials used, local geology and quality of groundwater, operation of the well, and maintenance. Causes of shortened well life include reduced pumping rate because of pump water or by a change in surface piping, lowering of the static water level, interference from nearby wells, lowering of the pumping level because of hydrologic influences, and clogging of the aquifer outside the well screen. An analysis of well problems using pumping rates and water levels plotted on graphs is shown. Pump failure, chemical incrustation, bacterial clogging, and lowering of static level can be determined using graphic methods. Proper record keeping is emphasized as the most effective means of maintaining well performance and saving large expenses by making it possible to monitor slight changes in well performance and to take early corrective action. MAXIMUM BREAKER HEIGHT,
Army Coastal Engineering Research Center, Washington, D.C.
J. R. Weggel.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol 98, No WW4, Paper 9384, p 529-548, November 1972. 9 fig, 3 tab, 19 ref, 3 append.

Descriptors: *Coastal engineering, *Coastal structures, *Ocean waves, *Breakwaters, Design criteria, Mathematical studies, Mass curves, Analytical techniques, Shore protection.
Identifiers: *Ocean wave breakers, Maximum wave breaker height.

Based on a reevaluation of available experimental data on breaking waves, a relationship between the breaker height-breaking depth ratio, the incident wave steepness and the beach slope is found. This relationship, when combined with experimental observations of breaker travel, permits an estimate of the maximum breaking wave height a coastal structure might experience given a design wave period and design depth at the structure site. Breaker-type classification according to inshore and offshore parameters as presently defined cannot be reconciled to observations of the relationship between breaker-height index, wave steepness, and beach slope. Revised criteria for breaker classification are presented. (Woodard-USGS)

CHARACTERISTICS OF WAVE RECORDS IN THE COASTAL ZONE,
Army Coastal Engineering Research Center, Washington, D.C.
D. L. Harris.
CERC Reprint 2-73, 1973. 51 p, 19 fig, 6 tab, 28 ref. (reprint from Waves on Beaches and Resulting Sediment Transport: Academic Press, Inc., 1972.)

Descriptors: *Ocean waves, *Beach erosion, *Waves (Water), *Oceanography, Measurement, Methodology, Mathematical studies, Energy equation, Gages, Aerial photography, Correlation analysis, Shore protection, Coastal engineering, Design criteria.
Identifiers: Ocean wave gaging, Wave record analysis.

Records from several types of ocean wave gages in coastal zones have been compared to obtained a measure of instrumental reliability. It is found that pressure records, as properly corrected, may give a better measure of surface waves, than some gages which record the surface elevation directly. An examination of the spectra computed from the records of a five-gage array of pressure gages at Pt. Mugu, California, provides evidence that the true spectra consist of a group of narrow spikes, not a smooth continuous function of frequency as often assumed. Data from Pt. Mugu and several east coast wave stations show that multinodal spectra are common in coastal locations. The frequency of maximum energy density in the pressure spectra is frequently different from that of the surface spectra or the velocity spectra. Photographs of waves from space are used to show that long crested waves with no more than slight variation in direction do occur in the ocean. Aerial photography of a coastal region is used to show that wave conditions can vary significantly within short distances in the coastal region. (Woodard-USGS)

FREE-SURFACE IDEAL FLUID FLOWS BY FINITE ELEMENTS,
Cornell Univ., Ithaca, N.Y. Dept. of Civil Engineering.
S. T. K. Chan, B. E. Larock, and L. R. Herrmann.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY6, Paper 9787, p 959-974, June 1973. 6 fig, 20 ref, 3 append.
NSF Grant GK-4789.

Descriptors: *Open channel flow, *Finite element analysis, Computer programs, Hydraulics, Hydrodynamics.
Identifiers: Free-surface flows.

The two-dimensional flow of an ideal fluid which emerges as a free surface jet from a containing vessel of arbitrary shape is studied. The finite element analysis of this problem seeks an approximate solution for the minimization of a functional which describes this problem. Gravity effects and curvilinear, solid boundary walls are easily taken into account. The method provides a rational analytical algorithm for adjusting free surface coordinates. The iterative technique used in conjunction with the algorithm requires the solution of a linear, symmetric, banded equation system during each iteration, which is quickly done Gaussian elimination. Results include not only free surface profiles but also velocity and pressure distributions throughout the flow domain. Computational examples are given which required 10-20 iterations and used 3 min to 8 min of execution time on the IBM 7044 computer. (Knapp-USGS)

UPLIFT PRESSURE BELOW HORIZONTAL APRON WITH CUTOFF AT INTERMEDIATE POINTS, FOUNDED ON ANISOTROPIC PERVIOUS MEDIUM OF FINITE DEPTH,
Jodphur Univ. (India).
B. C. Punmia, and S. C. Patwa.
Irrigation and Power (India), Vol 29, No 4, p 391-406, October 1972. 18 fig, 3 tab, 9 ref.

Descriptors: *Seepage, *Uplift pressure, *Dam design, *Analog models, Groundwater movement, Soil water movement.

The effects of finite depth and anisotrophy of the soil medium on seepage under weir aprons, with cutoffs at various positions, were studied using analog models. Theoretical solutions were based on Pavlovsky's analysis, taking into account the anisotropy of the soil medium. The principal parameters investigated are the total base width of the apron; the widths of the apron upstream and downstream of the cutoff pile; the depth of the pile; the depth of porous medium; and the anisotropy ratio. FORMATION OF CAVITY IN CONFINED AQUIFER,
Indian Inst. of Tech., Kharagpur. Dept. of Agricultural Engineering.
A. P. Mishra, and B. Anjaneyulu.
Irrigation and Power (India), Vol 28, No 3, p 241-244, July 1971. 3 fig, 8 ref.

Descriptors: *Water wells, *Aquifers, *Confined water, *Hydraulic models, Tubes, Dimensional analysis, Analytical techniques, Equations, Correlation analysis, Design criteria, Drawdown, Sands.
Identifiers: *Cavity wells, Cavity formation, Predicting cavity dimensions.

A type of tube-wells kntiown as cavity wells which have no strainers is preferred by the farmers because of low cost of construction. These wells draw water through a cavity formed below the well pipe in a confined aquifer. The boring is carried out through the entire upper confining clay layer up to the underlying sand layer and pumping is started. At the beginning, large quanties of sand come out along with discharge, but after some time the discharge will be free from sand which signifies that a stable cavity has been developed. The cavity should be developed to the safe limit of bearing capacity of upper confining layer; but in actual well it is not possible to measure the size of cavity developed. Experiments were conducted on the sand model of a tube-well in a confined aquifer to determine the shape and size of cavity formation. An equation based on dimensional analysis was used to predict the size of cavity formed in an aquifer of particular thickness when the diameters of particles and working drawdown are known. A nomograph is presented to avoid mathematical computations. For all the materials the shape of the cavity was parabolic when the top surface was circular. (Woodard-USGS)

LOADING AND DESIGN OF TRANSMISSION TOWERS,
Bureau of Reclamation, Denver, Colo.
H. Brenman.
Paper, ASCE Special Conference on Safety and Reliability of Metal Structures, Pittsburg, Pa., Nov 1972. 22 p, 6 fig, 5 ref.

Descriptors: *Transmission towers, Transmission lines, *Reliability, Erection, Structural design, Maintenance, Loads (Forces), Ice, Fabrication, Construction, Inspection, Snow, Wind pressure, Winds, Design criteria, Electric cables, Transmission (Electrical), Yield strength.
Identifiers: Transmission line hardware, National Electrical Safety Code, Overloads.

Modern civilization is so intimately dependent on electrical energy that the need for continuous delivery is unquestioned. The reliability and strength of transmission towers play a major role in the uninterrupted delivery of power. Methods of ensuring reliability in transmission towers are discussed. Each tower must be designed to support the transmission conductors, insulators, and hardware under all conditions other than unforeseeable catastrophes if delivery of power is to be uninterrupted. Most transmission lines require at least 3, sometimes 6 or 7, different types of either suspension or tension towers. Two major factors influencing structural reliability of transmission lines are: (1) loads, and (2) tower design. Other elements discussed include tower fabrication, foundation design and construction, erection, and periodic inspection and maintenance. (USBR)

THE CLUSTER LAYOUT--A NEW CONCEPT FOR PUMPER-STORAGE,
Bechtel Corp., San Francisco, Calif.
J. G. Patrick.
Water Power, Vol 24, No 9, p 339-345, Sept 1972. 10 fig, 1 tab.

Descriptors: *Pumped storage, Hydroelectric power, Pump turbines, Structures, *Underground powerplants, Underground structures, Structural design, Economics, Safety, Environmental effects, Feasibility studies, Cost comparisons, Submergence, Stress analysis.
Identifiers: Underground cavities, Layout, *Powerhouses.

Increasing use of pumped storage projects has caused rapid development of reversible pump turbine units. Increase in unit size and unit head has been remarkable, and the design of these modern high-speed, high-head units requires deeper submergence of the pump turbine unit below minimum level of the lower reservoir than required for a turbine only. The pumped storage plant usually has been an adaptation of a conventional powerplant. Additional submergence and drawdown at the lower reservoir have created costly design problems when using conventional powerplant designs. A new concept for pumped storage plants--the cluster design--offers a better solution to design requirements than conventional arrangements. The cluster design is described; advantages in design, safety, operation, cost, and environment are enumerated. Stresses in the rock surrounding the underground cavity are substantially lower for cluster powerhouses than for conventional underground powerhouses. (USBR)

HYDRAULIC JETTING, DRILLING TOOL AIDS DIRECTIONAL WORK,
Continental Oil Co., New Orleans, La.
R. E. McKee.
Oil and Gas Journal, Vol 69, No 12, p 146-148, March 22, 1971. 2 fig.

Descriptors: Drilling, Drilling fluids, *Hydraulic equipment, Hydraulic machinery, *Drilling equipment, Jets, Oil industry, Offshore platforms.
Identifiers: Jetting, *Directional drilling, Drill bits, Hydraulic horsepower.

A tool is discussed which adds to jet-deflecting efficiency for directional-hole surge pump, significantly increases instantaneous jet impact, bit horsepower, and nozzle velocity. A comparison test between jetting with surface pumps and the hydraulic jetting drilling tool showed a fourfold increase in bit horsepower with the rig using the hydraulic jetting drilling tool over the one without. The tool is operated by picking up the drill string until the bit is suspended a short distance off the bottom. At this time the tool is at its full extension and its fluid chamber is full. The string is then slacked off with the pumps on. At the instant the bit touches bottom, the string must be traveling at a rate sufficient to close the tool in .50 to .75 sec. After the bit reaches bottom, the drill string continues to move downward, forcing a stream of mud through the bit jets at a rate much greater than if the pumps were working alone. (Campbell-NWWA)

AIR BLAST DRILLING WITH ROTARY ROCK BITS,
Chicago Pneumatic Tool Co., Ill.
J. B. Coulter, Jr.
Water Well Journal, Vol 23, No 3, p 29-34, March, 1969. 2 charts.

Descriptors: Drilling, Rotary drilling, *Drilling equipment, Boreholes, Drilling fluids, Bearings, *Rock mechanics, Lubricants, Friction.
Identifiers: *Air rotary drilling, Drill bits, Drilling parameters, Compressors.

The most important part of air drilling is at the bottom of the hole where the air meets the cuttings. It is at this point that the success or failure of the application of air to rotary drilling is determined. Field data indicate that conventional flow or low pressure nozzles are more efficient than jet types nozzles for air drilling because there is less total effect at the bottom of the hole, expecially between the cones and the head section of the bit. A full opening or reduced full opening air course through the center of the head section to direct the air flow on top and part the cutter elements is recommended. Bearing lubrication is not a problem in air drilling, provided enough air volume flows through the bearings to prevent heat buildup. Drilling rates and total footage per bit are substantially greater when drilling with air as opposed to mud provided a sufficient volume of air is maintained to prevent chip recutting. A classification scheme for evaluation of dull bits is presented. (Campbell-NWWA)

A MODEL STUDY OF ROCK-JOINT DEFORMATION,
Norwegian Geotechnical Inst., Oslo.
N. R. Barton.
Int J Rock Mech Min Sci, Vol 9, No 5, p 579-602, Sept 1972. 15 fig, 8 tab, 23 ref.

Descriptors: *Joints (Geologic), *Fractures (Geologic), Model studies, *Faults (Geologic), Deformation, Rocks, Finite element analysis, Foreign research, Reviews, Rock mechanics, Rock properties, Engineering geology, Shear strength, Numerical analysis, Bibliographies.
Identifiers: Norway, Residual strength, Horizontal fractures.

Because of difficulties in numerically simulating jointed rock a widespread move toward physical modeling may contribute to obtaining better joint characteristics values. Existing rock-joint modeling techniques are reviewed. One physical modeling method produces mating tension fractures in a weak, brittle model material using a large guillotine device. Parallel sets of model joints can be produced which are continuous, cross-jointed or offset. Direct shear properties of these 3 types are compared and evaluated. Recent numerical modeling of jointed rock masses has been based on assumed values of the shear and normal stiffness of the joints. These components dominate the elastic deformation properties of the intact rock. Results of shear and normal stiffness tests on the model joints are used to assess these quantities. Shear stiffness depends upon both normal stress and size. For a given normal stress, an inverse proportionality exists between test dimension and shear stiffness. Normal stiffness depends on the preconsolidation or virgin normal stress level. Problems of simulating behavior of jointed rock masses by the finite element method are reviewed. (USBR)

FACTORIAL EXPERIMENTS IN CONCRETE RESEARCH,
James Cook Univ. of North Queensland, Townsville (Australia).
D. M. F. Orr.
Journal of American Concrete Institute, Proceedings, Vol 69, No 10, p 619-624, Oct 1972. 2 fig, 9 tab, 5 ref.

Descriptors: Cements, Compressive strength, *Concretes, *Statistical methods, Temperature, *Concrete technology, Statistics, Methodology, Research and development, Foreign research, Australia.
Identifiers: Factor analysis, Cement content, *Factorial experiments.

Single factor experiments conducted to investigate different responses of concrete could mask true effects because interactions among factors may occur. In such circumstances, using the factorial type of experiment is desirable. Further advantages of this technique are: (1) a check can be made on the precision of an experiment, and (2) errors can be identified. An example of the technique is presented, using cement temperature, initial mix temperature, cement composition, and water-cement ratio as factors. The anomaly in the analytical results was traced through calculations to the source–the testing laboratory. Significant interactions were found, indicating that conventional single factor experiments can mask true effects. Whenever interactions are suspected, the factorial technique should be used. (USBR)
W73-10609

SUGGESTED DESIGN AND CONSTRUCTION PROCEDURES FOR PIER FOUNDATIONS.
American Concrete Inst., Detroit, Mich. Committee 336.

Journal of American Concrete Institute, Proceedings, Vol 69, No 8, p 461-480, Aug 1972. 11 fig, 40 ref, append.

Descriptors: *Concrete construction, *Foundations, Excavation, *Structural design, Construction materials, Earth pressure, Reinforced concrete, Quality control, Concretes, Deflection, Linings, *Inspection, *Piers, Soil mechanics, Bibliographies, Loads (Forces).

Suggested design and construction procedures are presented for foundation peirs 2 ft 6 in. in diameter, or larger, made with plain concrete or reinforced concrete. This report by ACI Committee 336 is limited to piers constructed by digging, drilling, or otherwise excavating holes in the soil, later filled with concrete, and does not include rectangular piers or spread footings in deep excavation. While structural design and construction is the primary topic, the influence of soil mechanics is also considered. Combined attention of designer and constructor is essential for the successful design and construction of pier foundations to establish the necessary interrelation with the surrounding and supporting soil or rock. Design of piers includes: (1) determining overall pier size, and (2) a detailed design procedure of the concrete pier. Emphasis is placed on item (1) involving interaction between soil and pier, with item (2) referenced to ACI 318-71 (Building Code Requirements for Reinforced Concrete) or ACI 322. Construction methods described include excavation, casing, and placement of concrete and steel. Recommended procedures for inspection and evaluation and criteria for acceptance are presented. (USBR)

A NEW MATERIAL TO CEMENT WELL CASING,
Cities Service, Co., Corpus Christi, Tex.
D. L. Oliver, and F. T. Jones.
Oil and Gas Journal, Vol 67, No 41, p 95-96, October 13, 1969. 1 tab.

Descriptors: Wells, Grouting, *Cement grouting, Well casing, *Drilling fluids, Logging (Recording), Oil industry, Slurries, Testing, Testing procedures, Drilling equipment, Rotary drilling, *Materials testing, Concretes, Concrete placing, On-site tests.
Identifiers: Cement bond logging, Drilling mud.

A new material allows drilling fluids to be used in preparing custom slurries for down-hole casing cement. The mud-concrete product can be used in any water-based mud and will tolerate normal amounts of oil and diesel fuel in the mud. Two useful qualities of this slurry are: (a) the mud-concrete slurry does not contract when setting; and (b) the slurry is completely compatible with the drilling fluid system. Other advantages include: (1) except for low temperature slurries, the extended setting time of the mud cement at ambient temperatures will permit the optimum use of central mixing plants in active drilling areas; (2) reduced material requirements; (3) easy control of setting through use of retarders; (4) compressive strengths after 24 hr. generally above 500 psi, which is normally considered adequate; (5) easy control of slurry weight in pressure sensitive zones. Field test results on two differeent wells are given. (Campbell-NWWA)

8G. Materials

IMPREGNATION OF CONCRETE PIPE.
Southwest Research Inst., San Antonio, Tex.

Environmental Protection Agency, Water Pollution Control Research Series, June 1971. 73 p, 14 fig, 4 tab, 22 ref. EPA Program 11024 EQE, Contract 14-12-835.

Descriptors: Concrete, *Concrete pipes, Corrosion, *Corrosion control, Protective coatings, *Sewers, Sulfur, Hydrogen sulfide, Resins.
Identifiers: *Impregnation, *Hydrofluoric acid, Acid resistance, Bacterial action, Sulfate resistance.

Methods to increase the corrosion resistance, increase the strength, and reduce the permeability of concrete used in sewer line applications by impregnating the concrete pipe with relatively low cost resins such as asphalt, coal tars, linseed oil, sulfur, urea-formaldehyde, and others were investigated. The materials, techniques of application, test results and economics are presented. A large number of candidate impregnation materials were obtained and screened both in the laboratory and in limited field tests. Dilute hydrofluoric acid, sulfur and modified sulfur were found to impart the best corrosion resistance by impregnation. Other materials including vinyl-vinylidene chloride, vinyl acetate-acrylic, nitrile rubber latex, nitrile phenolic rubber, an emulsified reclaimed rubber and a rubber base adhesive, although failing to impregnate the concrete, formed surface coatings having exceptional corrosion resistance. (EPA)

PRACTICAL INTERFERENCE CURRENT TESTING ON UNDERGROUND METALLIC STRUCTURES,
Tennessee Gas Pipeline Co, Houston, Tex.
R. L. Seifert.
Materials Protection and Performance, Vol 11, No 10, p 41-49, Oct 1972. 17 fig.

Descriptors: *Corrosion, *Corrosion control, *Pipelines, *Underground structures, Structures, Metals, Metal pipes, Electrodes, Electrolysis, Cathodic protection, Rectifiers.
Identifiers: Galvanic protection systems, *Corrosion currents, *Stray current corrosion, Galvanic corrosion.

Step-by-step methods for handling stray current interference problems on underground metallic structures are presented. Stray currents of both static and dynamic characteristics are considered. Since interference problems are not encountered regularly prior to making interference tests, corrosion control personnel often must review the procedures. The literature is reviewed and a guide presented to aid both experienced and inexperienced corrosion control personnel. Specific interference problems ranging from simple categories to complex examples given in simple and concise terms may be adapted singularly or in combination to solve virtually every interference problem encountered. Pitfalls in establishing interference currents are discussed. (USBR)

FATIGUE OF STEEL WELDMENTS,
Jones and Laughlin Steel Corp., Pittsburgh, Pa.
B. Pollard, and R. J. Cover.
Welding Journal, Vol 51, No 11, p 544s-554s, Nov 1972. 8 fig, 6 tab, 84 ref.

Descriptors: *Welding, *Welded joints, *Fatigue tests, Stress, Stress relieving, Heat treatment, *Bibliographies, Metals.
Identifiers: Weldments, Butt welds, *Welds, Electroslag welding, Filler welds, Arc welding, *Fatigue (Materials), Residual stress.

Literature on fatigue of steel weldments was reviewed and the effects on fatigue strength of testing conditions, weld geometry, weld metal soundness, residual stress, and microstructure of the weld metal and heat-affected zone were examined. Weld geometry was shown as the most important factor in determining fatigue properties of a weld. For a given weld geometry, the fatigue strength is determined by the severity of the stress concentration at the weld toe or, with the weld reinforcement removed, by the stress concentration at weld metal defects. Different welding processes influence fatigue strength by producing welds with different degrees of surface roughness and weld metal soundness. Residual stress caused by welding only affects fatigue strength for alternating loads. Under these conditions a moderate increase in fatigue strength is obtained by thermal stress relief. Larger increases in fatigue strength may be obtained by postweld treatments that produce compressive residual stresses, instead of the original tensile stresses, at the weld toe. The microstructures of the weld metal and heat-affected zone have only a minor effect upon the fatigue strength of welds and are usually masked by the much greater effects of weld geometry and weld defects. (USBR)
W73-10617

REINFORCED THERMOPLASTICS AND THERMOSETS FOR CORROSION CONTROL: STATE OF THE ART,
Monsanto Co., St. Louis, Mo.
T. L. Tolbert, and T. B. Lewis.
Materials Protection and Performance, Vol 11, No 4, p 19-24, April, 1972. 3 fig, 4 tab, 27 ref.

Descriptors: Materials, Materials testing, *Plastic pipes, *Plastics, Corrosion, Corrosion control, Pipes, *Physical properties, Strength of materials, Stainless steel, Asbestos, Cost analysis.
Identifiers: Fiberglass, *Thermoplastics.

The remarkable growth rate in use of FRP (Fiberglass Reinforced Plastic) for corrosion resistant service--15 to 25% per year during most of the 1960's--is testimony both to the need for improved corrosion resistant materials and to the corrosion engineer's increasing acceptance of reinforced plastics as materials of construction. Properties of this material which makes it advantageous in various applications are (1) superior corrosion resistance; (2) high strength and light weight; (3) low thermal and electrical conductivity; (4) ease of installation and little maintenance; (5) low installed cost. A high speed filament winding process coupled with an improved resin system has been used in fabrication of pipe to successfully bridge the cost barrier with steel; list prices for some sizes of vinyl-epoxy / glass pipe for oil field service have been reported to be below those of Schedule 40 (bare) steel. A comparison of FRP with other corrosion-resistant structural materials is given, along with properties of reinforcing agents used in FRP. (Smith-NWWA)
W73-10708

LESS TIME, FEWER HAZARDS WITH PELLETIZED ACID,
Universal Oil Products, St. Paul, Minn. Johnson Div.
D. C. Schafer.
Johnson Drillers' Journal, p 4-5, March-April 1971. 2 fig.

Descriptors: Wells, *Water wells, *Well screens, Chemicals, Chemical reactions, Municipal water, Pumps, Pumping, *Acids, Wellpoints.
Identifiers: *Rehabilitation (Wells), *Incrustation, Scaling, *Hydrochloric acid, Acid pellets.

For rehabilitation of incrusted water wells, acid pellets which dissolve readily once they fall to the bottom of a well save time and reduce the hazards of acid treatment. Use of these pellets makes it unnecessary to transport and handle dangerous liquid hydrochloric acid and eliminates the need for cumbersome pipe or hose arrangements to conduct liquid acid into the well screen. Advantages of pellitized acid over dry powdered acid are also given, mainly that less acid is needed in pellet form. The pump may be left in the well provided the space between pump and casing is large enough to allow the pellets to fall past the pump. Results are improved by agitation of the acid solution in the well; this can be done by starting and stopping the pump or by the use of a surge plunger. In order to force the solution out of the screen into the formation, it is recommended that a quantity of water equal to the volume in the screen be put into the well. After remaining for several hours or preferably overnight, the solution should be pumped to waste until the water is clean. Case histories of use in various municipal wells are given. (Smith-NWWA)

WELL LEVEL MEASUREMENT METHODS,
Maguire (Charles A.) and Associates, Boston, Mass.
R. H. Babcock.
Journal New England Water Works Association, Vol 85, No 1, p 1-9, March, 1971. 3 fig.

Descriptors: Wells, Water wells, *Water level recorders, *Water level fluctuations, Water levels, Groundwater, Groundwater resources, Well spacing, Well data, *Observation wells.
Identifiers: Water level records.

The measurement of well levels is essential for the evaluation of both proposed and existing ground water supplies. 2 1/2-inch observation wells are commonly used for this purpose, and can be located both adjacent to the well under test and at some distance to permit plotting and drawdown curve, as well as observing the influence of pumping upon the water table. The discussion is limited to those level measurement methods which are mechanical and, therefore, can be considered to have the highest degree of dependability for the conditions encountered. The most common technique, explained in detail, is the use of the bubble tube. Another arrangement, though not as well known as the common bubble tube, is the charged air bell method. The third class of devices for this service could be called hydropneumatic. Auxiliary devices for performing such functions as low water cutout or alarm, level or drawdown control, and level measurement transmission are described. (Campbell-NWWA)

FIND, HALT CORROSION IN WELL CASING NOW FOR SAVINGS IN THE FUTURE,
Sun Oil Co., Tulsa, Okla.
E. J. Simmons.
Oil and Gas Journal, Vol 66, No 37, p 120-124, 127, September 9, 1968. 6 fig.

Descriptors: Corrosion, *Corrosion control, Logging (Recording), *Cathodic protection, *Well casing, Electrochemistry, Anodes, Bentonite, Resistivity, Pitting (Corrosion).
Identifiers: Well logging, *Caliper logging, Ground beds.

Costly workovers of wells due to leaks in the casing caused by external corrosion have prompted much investigative work and many individual as well as field-wide installations of cathodic protection systems. To obtain an idea of the extent of corrosion damage, the casing thickness logging tool is useful. Its signal undergoes a phase shift dependent on, among other things, the mass of metal surrounding the coils. This phase shift is recorded continuously on a chart at the surface as the tool is pulled up the hole, giving a continuous indication of metal mass surrounding the coils. Available as an auxiliary tool which can be run simultaneously with the casing-thickness tool is the electronic internal caliper log. Using both logs simultaneously, it is possible to ascertain whether pitting is external or internal. Curves of logs showing what collars, pits, holes, general corrosion, lower weight joints, and tapers would look like on a graph are given. An overview of the process of cathodic protection as applied to well casing is outlined. (Campbell-NWWA)
W73-10715

WELL LOGS: A BASIC DRILLING TOOL--6. USE DIAGENESIS TO SPOT FORMATION CHARACTERISTICS,
Dresser Industries, Inc., Houston, Tex. Oilfield Products Div.
W. R. Matthews.
Oil and Gas Journal, Vol 70, No 3, p 97-101, January 17, 1972. 15 fig, 23 ref.

Descriptors: *Logging (Recording), *Electrical well logging, Radioactive well logging, Pressure, *Geologic investigations, Geologic units, Salinity, Resistivity, Limestones, Oil industry, Sandstones, Drilling, Gamma rays, Drilling fluids, *Diagenesis.
Identifiers: Oil reservoirs, Nuclear well logging.

The use of principles of diagenesis, which includes compaction, cementation, recrystallization, and perhaps replacement, can show unconformities, faults, development of high pressure, communication between zones, and permeable sand with a large areal extent. An unconformity will be marked by an abrupt decrease in diagenetic values; faults are characterized by a very abrupt change from a decreasing diagenetic value to an increasing one; a marked gradual increase in diagenetic values characterizes the onset of high pressures; and zones in communication with other zones will show a very sharp increase in diagenetic values. Apparent diagenetic-stress factors can be obtained from gamma-ray logs; the procedure is outlined. Zones of lost circulation can sometimes be noted on induction logs--they are characterized by abnormally high resistivities. The makeup water is much fresher than the formation water in the normal compaction depths. (Smith-NWWA)

FUNDAMENTALS OF CATHODIC PROTECTION,
Mobil Research and Development Corp., Dallas, Tex.
F. E. Blount.
In: Proceedings, University of Oklahoma Corrosion Control Course, September, 1970, p 17/1 - 17/10. 7 fig, 2 tab, 3 ref.

Descriptors: Corrosion, *Corrosion control, *Cathodic protection, Resistance, Oxidation-reduction potential, Electrolytes, Anodes, Cathodes, Metals, Ions, Ion transport, Ionization.
Identifiers: *Polarization, *Electrical potential, Electromotive series, Stray currents.

Basic electrochemical principles necessary to the understanding of cathodic protection are discussed and explained; these principles are related to cathodic protection using and electrical analogy. The electron current flow concept (i. e., current is considered to be flowing from anode to cathode) is used throughout the discussion. The four components of a corrosion circuit are described, and the nature of the driving force in a corrosion cell is discussed covering such topics as

oxidation potentials, the zero potential, use of oxidation potentials to predict reactions, the electromotive series of metals, and the magnitude of potentials. Electrical analogies for cathodic protection mechanisms are given along with their limitations. The procedure of emf measurement between the structure to be protected and a reference electrode in order to determine whether the structure is being adequately protected is shown. (Campbell-NWWA)
W73-10784

HEAT FLOW AND PRECISION TEMPERATURE MEASUREMENTS IN BOREHOLES,
Virginia Polytechnic Inst., Blacksburg.
J. K. Costain, and P. M. Wright.
In: Society of Professional Well Log Analysts 10th Annual Logging Symposium, p J1-J21, 1969. 6 fig, 27 ref.

Descriptors: *Boreholes, *Heat flow, *Utah, Thermal radiation, Geophysics, Temperature, Instrumentation, *Data collections, Heat transfer, Conductivity, Rock properties.
Identifiers: Thermal energy, *Geothermal gradient, Thermal conductivity.

Heat flow measurements in boreholes might be a valuable supplementary exploration method in the future. Both the geothermal gradient and the rock thermal conductivity are necessary for a heat flow measurement. Comparison of the resistance of a platinum resistance probe with a primary standard resistance yields resistance measurements accurate in the field to about 0.003%. This value for a probe whose nominal ice-point resistance is about 1,000 ohms, is equivalent to an accuracy of plus or minus 0.01 degree C. However, other factors lower the absolute accuracy of temperature measurements to about plus or minus 0.05 degree C. The overall accuracy of heat flow measurements is probably 10% to 15%. A capstan hoist powered by a 2-hp electric motor was used to raise a double armored cable out of the borehole. (Smith-NWWA)
W73-10786

LOWEST COST-PER-FOOT IS AIM OF OWN CALCULATIONS,
D. Murphy.
Oil and Gas Journal, Vol 67, No 9, p 110-114, March 3, 1969. 8 fig, 2 ref.

Descriptors: Drilling, *Rotary drilling, *Optimization, Drilling equipment, Equations, Mathematical studies, Drilling fluids, Bearings, *Cost analysis.
Identifiers: *Drilling parameters, Rotary speed, Bit weight, Drill bits, Drill testing.

Three basic equations are given to determine optimum bit weights and rotary speeds. They are those for instantaneous drilling rate, instantaneous rate of tooth dulling, and the equation used to determine rotating hours before bearings fail. The four point drilling test is made during the half-life of the bit run so that the drilling rate will reflect an average of M and gamma (weight parameter and rotary speed exponent) over the entire run. A drilling test should be performed in the following order: (1) start the test with maximum weight so that if bit balling is going to be a problem, it will be apparent early and a lower weight can be used; (2) going from one point to the next requires a change in weight or rotary speed--not both; (3) the only time weight must be drilled off is in going from point 2 to point 3 in the four point test, and this is drilled off at maximum operating conditions; (4) the test can be run in the shortest time, and changes in total tooth wear will be a minimum. (Campbell-NWWA)

SEISMOGRAPH AND RESISTIVITY USE IN SHALLOW GROUNDWATER SEARCH,
Layne-Northwest Co., Milwaukee, Wis.
J. P. O'Connor.
Journal of the American Water Works Association, Vol 62, No 7, p 433-434, July, 1970. 2 fig.

Descriptors: Groundwater, *Geologic investigations, Glacial aquifers, *Gravels, Shallow wells, Seismic waves, *Seismographs, Seismic properties, Surveys, Exploration, *Subsurface water availability, Resistivity, Zone of saturation.
Identifiers: Subsurface data, Lithology.

As the search for groundwater becomes more and more intensified, the need for fast, dependable aids to exploration becomes greater. A seismic instrument for use in ground water exploration utilizes a cathode ray tube to record seismic waves. The unit consists of the instrument itself, in 6 volt wet cell battery, a geophone, and a manually operated hammer or tamper used to create shock energy. Different methods of setting up the device, using different 'spreads' or lines of shock initiation are given. Test drilling many 'single spread' depth determinations to water table and bedrock have shown, in most instances, an accuracy of plus or minus 10 per cent. The seismograph provides accurate information on the thickness of saturated material underlying the areas of interest, information which is used to determine areas worthy of further geophysical exploration with the earth resistivity instrument. The seismograph also is useful in determining the type of bedrock, employing the principle that sound will travel at differing rates in materials of differing densities (i.e., differing lithologies). WATER AND RELATED LAND RESOURCES TRAINING NEEDS STUDY, COMPREHENSIVE PLANNING FOR WATER AND RELATED LAND RESOURCES IN ALABAMA,
Auburn Univ., Ala. Center for Urban and Regional Planning.
S. P. Snow.
Available from the National Technical Information Service as PB-213 562, $3.00 in paper copy, $0.95 in microfiche. Alabama Development Office, Montgomery, Report No. ALA-AU-X996-WRC-72-3, February, 1972. 86 p, 6 append. WRP-71-1.

Descriptors: *Water resources planning, *Training, Education, *Alabama, Land use, *Management.

It is difficult to obtain reliable and useful information concerning training needs for Alabama agencies involved in water resource and related land use programs. This situation is due in part to a general lack of understanding of what is involved in the over-all view of water resources and related land use planning, what role each agency plays in the process, and possibly a gap between what these agencies are doing and what needs to be done. In-house training is often dictated by the agency's purpose and function and closely linked with the degree of knowledge, training and background of its personnel. There is no one agency with knowledge of what is being offered on the continuing education level to meet training needs in Alabama. Additional formal courses and special programs especially at senior and graduate school levels are needed. A centralized training agency to initiate and co-ordinate an interagency and public education program with initial emphasis on pollution control, resource planning, water quality maintenance and improvement, and on water resource planning should be established. Appendices include an extensive catalog of available courses, sources of financial support and addresses of educational institutions. (Elfers-North Carolina)

CONCEPTUAL SYSTEM DESIGN FOR AN ENVIRONMENTAL INFORMATION BASE FOR MANAGEMENT OF WATER AND RELATED RESOURCES BY STATES,
Banks (Harvey O.), Inc., Belmont, Calif.
O. Banks, and G. T. Orlob.
Available form the National Technical Information Service as PB-221 124, $4.85 in paper copy, $0.95 in microfiche. Completion Report, March 1973. 78 p, 2 fig, 4 append. OWRR X-114 (No. 3424) (1).

Descriptors: *State governments, *Management, *Decision-making, *Environment, *Natural resources, *Electronic Data Processing, *Data Storage and Retrieval, *Information Retrieval, Data collections, Systems design, Computers, Data Transmisson, Water resources, Land resources, Geographical Regions, Hydrologic Data.
Identifiers: Information Base, User-oriented, State level.

Research was undertaken to evaluate the present resource information management activities of the states as related to state functions, and to develop a concept for planning and designing a comprehensive state or regional information management system. Sound environmental resource development and management is increasingly a state responsibility, requiring availability of a comprehensive information base for evaluating alternatives. Incompatibility between state agency, and between state and federal agency data files, documented by questionnaires and field surveys, limits the accessibility of relevant information to resource managers. A state-level Environmental Resources Information Management System was conceptualized, supported by an Environmental Information Base incorporating the organized and systemized aggregation of resource information available from all resource agencies. Conceptual format and guidelines for the Information Base includes identification of Resource Subjects related to state agency functions, and a systemized methodology for classifying and indexing data types and parameters. Institutional arrangements for implementing the concepts were formulated. Tables include results from state surveys, and charts show the structure of the Information Management System and Information Base. The methodology would enable a state to develop and implement an Information Base that would provide compatible, accessible information on a timely basis for resource management by all agencies.

HYDROLOGY AS A SCIENCE,
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
M. J. Dvoracek, and D. D. Evans.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 19-29 (1972), 2 figs, 1 tab, 4 ref.

Descriptors: *Hydrology, *Education, *Systems analysis, Southwest U.S., Arid lands, Water balance, Hydrologic cycle, Oceanography, Meteorology, Geology, Biology, Glaciology, Geomorphology, Soils, Hydrologic properties, Water resources development, Water utilization, Water requirements, Surface waters, Groundwater, Water importing, Effluents, Water management (Applied), Water law, Economic impact, Legal aspects, Political aspects, Social aspects, Ecology, Environmental effects, Water users.

Experimental and historical development of the systematic study of water is briefly reviewed to prove hydrology a science. The Hydrology program at the University of Arizona is outlined, and details of the course 'water and the environment' are expounded. This introductory course is intended for non-scientific oriented students at this southwestern university. A reading list is provided for the class, and scientifically designed laboratory experiments are developed. The first semester includes discussion of world water inventory; occurrence of water; hydrologic cycle; interaction of oceanography, meteorology, geology, biology, glaciology, geomorphology and soils; properties of water (physical, biological, chemical), and resources development. The second semester discusses municipal, industrial and agricultural water requirements, surface, ground, imported and effluent water resources management; water law; economic, legal, political, and social water resource planning; ecological impact; patterns of use; and survival of man. Mathematical problems are reviewed along with ecological orientation of students. (See also W73-10818) (Popkin-Arizona)

10D. Specialized Information Center Services

DESIGN AND PILOT STUDY OF AN ARIZONA WATER INFORMATION SYSTEM,
Arizona Univ., Tucson. Office of Arid Lands Studies.
K. E. Foster, and J. D. Johnson.
In: Hydrology and Water Resources in Arizona and the Southwest, Vol 2, Proceedings of the 1972 meetings of the Arizona Section, American Water Resources Assn., and the Hydrology Section, Arizona Academy of Science, May 5-6, 1972, Prescott, Arizona, p 43-52, (1972). 2 fig, 9 ref.

Descriptors: *Hydrologic data, *Information retrieval, *Water, *Design data, *Arizona, Hydrologic systems, Groundwater, Rainfall-runoff relationships, Water levels, Water quality, Water utilization, Water demand, Arid lands, Data storage and retrieval.

Water information systems may have different demands, such as responding to queries about rainfall-runoff relationships, water level data, water quality data and water use. Data required for retrieval may need display, such as a hydrograph. Information systems are reviewed and results of specific water information agencies are reported. Agencies in Arizona are listed with their specific water information need. Development of a water activity file and water information system is outlined for Arizona as a pilot project. Linkage of units within the data system is shown, as is the information system's questionnaire to project leaders. Information currently in the system includes water quality from the State Department of Health for 450 wells in the Tucson Basin, and water level, storage, storage coefficient and transmissivity supplied by the Arizona Water Commission for the Tucson Basin and Avra Valley. Quality of data submitted to the system should be reflected in retrieval for better understanding of the data. This consideration is planned for the coming fiscal year. Field Experiments on Freezing and Thawing at 3.350 Meters in the Rocky Mountains of Colorado, U.S.A.,
W73-10976 2C

Preliminary Observations on Downslope Movement of Soil During the Fall in the Chinook Belt of Alberta,
W73-10977 2J

ALTERATION OF FLOW
Formation of Public Policy on Issue of Out-of-Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area,
W73-10726 6B

ALTERNATIVE PLANNING
An Economic Model of an Area's Response to Depletion of its Water Resources,
W73-10405 4B

The Development of A Plan of Study--An Interagency Approach to Multiobjective Planning and Evaluation of Water and Land Resource Use,
W73-10622 6A

Collective Utility of Exchanging Treated Sewage Effluent for Irrigation and Mining Water,
W73-10834 3C

AMBERLITE XAD-2
Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-10490 5B

AMMONIA
Determination of Ammoniacal Nitrogen in the Presence of Urea with an Ammonia Electrode,
W73-10474 5A

On the Storage of Seawater Samples for Ammonia Determination,
W73-10518 5A

Process for Removal of Ammonia From Waste Water Streams,
W73-10594 5D

Absorption of Ammonia from Atmospheric Plumes by Natural Water Surfaces,
W73-10867 5B

Release of Ammonium-N from Sediments to Waters,
W73-10939 5B

AMMONIA ELECTRODE
Determination of Ammoniacal Nitrogen in the Presence of Urea with an Ammonia Electrode,
W73-10474 5A

AMUR KETA
Scale Structure of the Amur Keta Oncorhynchus Keta (Walb.) as an Index of Growth and Living Conditions During the Freshwater Stage of Life, (In Russian),
W73-10642 2I

ANADROMOUS FISH
An Evaluation of the Possible Effects of Water Diversion of the Connecticut River on the Biology of Anadromous Fish in the River,
W73-10729 2I

ANAEROBIC BACTERIA
Simplified Gas Chromatographic Procedure for Identification of Bacterial Metabolic Products,
W73-10502 5A

Halogenated Compounds for the Sensitive Detection of Clostridia by Gas Chromatography,
W73-10550 5A

Method for Exposing Bacterial Cultures on Solid Media to a Defined Gas Mixture Using Nylon Bags,
W73-11049 5A

ANALOG MODELS
Uplift Pressure Below Horizontal Apron with Cutoff at Intermediate Points, Founded on Anisotropic Pervious Medium of Finite Depth,
W73-10995 8B

ANALOG-TO-DIGITAL CONVERTERS
Focus On A/D and D/A Converters,
W73-11018 7C

ANALYSIS
A Comparative Study of Resource Analysis Methods,
W73-10737 6A

An Analysis of Yearly Differences in Snowpack Inventory Prediction Relationships,
W73-10821 2C

Weather Modification in Arizona, 1971,
W73-10832 3B

Objective and Subjective Analysis of Transition Probabilities of Monthly Flow on an Ephemeral Stream,
W73-10843 2E

ANALYTICAL TECHNIQUES
The Determination of Vandium in Brines by Atomic Absorption Spectroscopy,
W73-10442 5A

Some Results and Ways of Developing Methods of Streamflow Measurement in Mountain Countries (Nekotoryye itogi i puti razvitiya sposobov rascheta stoka v usloviyakh gornykh stran),
W73-10449 7B

Vibrio Parahaemolyticus Methodology for Isolation from Seafoods and Epidemic Specimens,
W73-10874 5A

A Biological Evaluation of the Molybdenum Blue Method for Orthophosphate Analysis,
W73-10943 5A

ANHINGAS
Some Ecological Aspects of a Nesting Colony of Herons,
W73-10651 2H

ANIMAL PHYSIOLOGY
The Relationship Between Ions and Ciliary Activity in the Gill of Mytilus edulis,
W73-10543 5C

Effect of Seawater Soluble Fraction of Kerosene on Chemotaxis in a Marine Snail, Nassarius Obsoletus,
W73-10872 5C

ANIMAL POPULATIONS
An Estimator For the Size of an Animal Population,
W73-11017 7C

ANIMAL TISSUES
Chlorinated Hydrocarbon Pesticides and Related Compounds in Adipose Tissue from People of Japan,
W73-10854 5A

ANIONS
The Relationship Between Ions and Ciliary Activity in the Gill of Mytilus edulis,
W73-10543 5C

ANNELIDS
Study of the Contamination of Arenicola Marina L. by Cobalt-60, (Etude de la Contamination d'Arenicola Marina L. (Annelide Polychete) Par LM Cobalt-60),
W73-10551 5C

ANTARCTIC
Characteristics of the Nearshore Environment off the South Coast of Anvers Island, Antarctic Peninsula,
W73-10520 5A

ANTECEDENT MOISTURE CONTENT
Significance of Antecedent Soil Moisture to a Semiarid Watershed Rainfall Runoff Relation,
W73-10841 2G

ANTIBIOTICS (PESTICIDES)
A New, Sensitive Method For the Determination of Streptomycin,
W73-10514 5A

ANTIMYCIN A
Methods of Estimating the Half-Life of Biological Activity of Toxic Chemicals in Water,
W73-10495 5C

AQUATIC ALGAE
The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

Freshwater Algae From the Itasca State Park Minnesota, IV. Cyanophta, Rhodophyta, Chloromonadophyceae, and Cryptophyceae,
W73-10544 5A

Desmids from Southeast United States of America, (Desmidieen aus dem Sudosten der Vereinigten Staaten von Amerika),
W73-10546 5A

Algal Response to Detergent Phosphate Levels,
W73-11008 5C

AQUATIC ANIMALS
Bioturbation Rates and Effects in Carbonate Sand, St. John, U.S. Virgin Island,
W73-10984 2J

AQUATIC BACTERIA
The Validity of the Application of Simple Kinetic Analysis to Heterogeneous Microbial Populations,
W73-10489 5C

Competition Between an Alga and an Aquatic Bacterium for Phosphate,
W73-10894 5C

AQUATIC HABITATS
Freshwater Algae From the Itasca State Park Minnesota, IV. Cyanophta, Rhodophyta, Chloromonadophyceae, and Cryptophyceae,
W73-10544 5A

AQUATIC PLANTS
Beneficial Aquatic Plants in Coastal Areas,
W73-10955 3B

Growth of a Floating Aquatic Weed, Salvinia Under Standard Conditions,
W73-11007 5C

AQUATIC POPULATIONS
Productivity of Aquatic Organism Communities of Different Trophic Levels in Kiev Reservoir,
W73-10911 5C

AQUATIC PRODUCTIVITY
The Limnology of Stockbridge Bowl, Stockbridge, Massachusetts,
W73-10561 5C

Observations on the Transparency of the Waters of the Pulicat Lake with Particular Reference to Plankton Production,
W73-11046 5C

AQUATIC SOWBUG
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

AQUATIC WEED CONTROL
Aquatic Plant Control Program.
W73-10951 4A

Mechanical Equipment Used for Aquatic Plant Control in Louisiana,
W73-10952 4A

Current Investigations in the Jacksonville District Concerning Mechanical Harvesting of Obnoxious Aquatic Plants,
W73-10953 4A

Mechanical Equipment 'Weed Witch' for Aquatic Plant Control,
W73-10956 3B

Summary of CO2 Laser-Water Hyacinth Laboratory Research,
W73-10957 3B

Field Laser,
W73-10958 3B

Aquatic Plant Control Research Project Plan FY 73-77 (PPB Report),
W73-10959 3B

Integration of Biological and Chemical Control of Alligator Weed,
W73-10960 3B

Mechanical Harvesting of Water Hyacinth in Shell Creek Reservoir, Charlotte County, Florida,
W73-10962 3B

Evaluation of Aquamarine Corporation Mechanical Harvester in Removal of Water Hyacinths, St. Johns River, Blufton, Fla.,
W73-10963 3B

AQUEOUS SOLUTIONS
Hydrolysis of Aqueous Solutions of Sodium 2,2-Dichloropropionate Under Self-Induced Alkaline Conditions,
W73-10506 5B

Two Instruments for Activation Analysis of Solutions by a Dilution Method,
W73-10509 7B

A New, Sensitive Method For the Determination of Streptomycin,
W73-10514 5A

The Atomic Absorption Determination of Zinc with a Graphite Furnace,
W73-10515 5A

The Extraction of the Chromium (III)-Edta Complex by Solutions of Aliquat-336 in Various Organic Solvents,
W73-10523 5A

The Indirect Spectrophotometric Determination of the Sulphate Ion With 2-Aminoperimidine,
W73-10527 5A

Atomic Fluorescence Characteristics of Copper in Various Premixed Flames,
W73-10531 5A

Sodium and Magnesium Sulfate Ion Pairing: Evidence from Raman Spectroscopy,
W73-10650 1B

A Simple Modification of a Flame Photometer for Routine Trace Potassium Analysis,
W73-10852 5A

Separation and Preconcentration,
W73-10861 5A

Trace Element Determination with Semiconductor Detector X-Ray Spectrometers,
W73-11031 5A

Comparison of Flame and Flameless Atomic Absorption for the Determination of Calcium,
W73-11037 2K

AQUEOUS SOLUTIONS

A Penicillin Selective Enzyme Electrode,
W73-11042 5A

X-Ray Microdetermination of Chromium, Cobalt, Copper, Mercury, Nickel, and Zinc in Water Using Electrochemical Preconcentraton,
W73-11043 5A

Spectrophotometric Determination of Sulfate Ion with Barium Iodate and the Linear Starch Iodine System,
W73-11045 5A

The Extraction of Divalent Cobalt, Copper, Zinc and Cadmium from Hydrochloric Acid Solutions by Tri-n-Butyl Phosphate,
W73-11050 5A

AQUIFER CHARACTERISTICS

Groundwater Resources of Coke County, Texas,
W73-10744 4B

Water-Level Decline and Pumpage in Deep Wells in Northern Illinois, 1966-1971,
W73-10993 4B

AQUIFER SYSTEMS

Role of Connecticut River Flood Flows in Recharging Ground-Water Formations,
W73-10733 4B

AQUIFERS

Subsidence Damage in Southern Arizona,
W73-10825 2F

Transmissivity Distribution in the Tucson Basin Aquifer,
W73-10827 2F

Formation of Cavity in Confined Aquifer,
W73-10996 8B

AQUITARDS

Effect of a Water Table Aquitard on Drawdown in an Underlying Pumped Aquifer,
W73-10968 4B

ARCTIC

The Char Lake Project. A Study of Energy Flow in a High Arctic Lake,
W73-10904 5C

ARENICOLA MARINA

Study of the Contamination of Arenicola Marina L. by Cobalt-60, (Etude de la Contamination d'Arenicola Marina L. (Annelide Polychete) Par LM Cobalt-60),
W73-10551 5C

ARID LANDS

Woody Phreatophytes Along the Brazos River and Selected Tributaries Above Possum Kingdom Lake,
W73-10745 3B

Some Legal Problems of Urban Runoff,
W73-10830 6E

Nitrogen Species Transformations of Sewage Effluent Releases in a Desert Stream Channel,
W73-10836 5D

ARIZONA

Technical, Economic and Legal Aspects Involved in the Exchange of Sewage Effluent for Irrigation Water for Municipal use, Case Study - City of Tucson,
W73-10402 5D

Predicting Degree Day Snow Melt Factors with Crown Closure in Arizona Ponderosa Pine,
W73-10697 2E

Hydrology and Water Resources in Arizona and the Southwest, Volume 2.
W73-10818 2A

Design and Pilot Study of an Arizona Water Information System,
W73-10822 10D

Man-Nature Attitudes of Arizona Water Resource Leaders,
W73-10823 6B

Nitrogen Species Transformations of Sewage Effluent Releases in a Desert Stream Channel,
W73-10836 5D

Role of Modern Methods of Data Analysis for Interpretation of Hydrologic Data in Arizona,
W73-10839 6B

AROMATIC COMPOUNDS

Identification of Heavier Aromatic Components in Reformed Petroleum Products by Direct Coupled Capillary Gas Chromatography-Mass Spectrometry,
W73-11044 5A

ARSENIC

Dry Ashing Technique for the Determination of Arsenic in Marine Fish,
W73-10482 5A

ARTESIAN WELLS

Controlling Flowing Artesian Wells,
W73-10718 8A

Unsteady Flow Twoard an Artesian Well,
W73-10967 4B

ARTHROPODS

A Comparison of Microarthropod Populations in Sewage-Exposed and Sewage-Free Spartina Salt Marshes,
W73-10814 5C

ARTIFICIAL RECHARGE

Fate of Suspended Sediment During Basin Recharge,
W73-10668 2J

ASIA

Well Drilling in Southeast Asia,
W73-10795 8A

ASSAY

A New, Sensitive Method For the Determination of Streptomycin,
W73-10514 5A

Rapid Determination of Very Low Nitrogen Levels in Water,
W73-10853 5A

ASSESSMENTS

Assessment of Geothermal Energy Resources.
W73-10696 6B

ATLANTIC COAST

Beneficial Aquatic Plants in Coastal Areas,
W73-10955 3B

ATLANTIC OCEAN

Report of Study on Ships Channels and Harbors,
W73-10576 5G

Halogenated Hydrocarbons in and Over the Atlantic,
W73-10873 5B

ATMOSPHERIC TRANSPORT

Absorption of Ammonia from Atmospheric Plumes by Natural Water Surfaces,
W73-10867 5B

ATOM RESERVOIR ATOMIC ABSORPTION SPECTROPHOTOMETRY

The Direct Determination of Chromium in Urine by Selective Volatilization with Atom Reservoir Atomic Absorption,
W73-10525 5A

ATOMIC ABSORPTION ANALYSES

Spectrographic Analysis of Metals in Freshwater Sediments,
W73-10407 5A

ATOMIC ABSORPTION SPECTROPHOTOMETRY

Marina Del Rey: A Study of Environmental Variables in a Semi-Enclosed Coastal Water,
W73-10465 5B

A Study of the Effect of pH on the Determination of Zinc by Atomic Absorption Spectrophotometry,
W73-10499 5A

The Atomic Absorption Determination of Zinc with a Graphite Furnace,
W73-10515 5A

The Determination of Manganese in Urine by Atomic Absorption Spectrometry,
W73-10528 5A

The Determination of Trace Metals and Their Significance in Clinical Chemistry,
W73-11030 5A

Comparison of Flame and Flameless Atomic Absorption for the Determination of Calcium,
W73-11037 2K

Some Observations on Standard Mercury Solutions for Atomic Asborption Spectroscopy,
W73-11038 5A

ATOMIC FLUORESCENCE SPECTROSCOPY

Atomic Fluorescence Characteristics of Copper in Various Premixed Flames,
W73-10531 5A

ATTACHED ALGAE

Primary Production of a Montane River,
W73-10923 5C

ATTITUDES

Historical, Political and Social Factors Affecting Public Policy on River Diversion: Out-of-Basin Diversion of Connecticut River Flood Waters to the Boston Metropolitan Area,
W73-10727 3D

Man-Nature Attitudes of Arizona Water Resource Leaders,
W73-10823 6B

AUSTRALIA

Chloride Balance of Some Farmed and Forested Catchments in Southwestern Australia,
W73-10669 2K

AUSTRIA

A High-Mountain Lake (Vorderer Finstertaler See, Kuehtai, Austria) As a Model of Energy Flow Through A Freshwater Ecosystem, (In German),
W73-10870 2H

AUTOMATIC CONTROL

Focus On A/D and D/A Converters,
W73-11018 7C

Digital-to-Analog Converter Having Common-Mode Isolation and Differential Output,
W73-11019 7C

Fast Liquid Chromatography,
W73-11022 5A

AUTOMATIC NITROGEN ANALYZER
The Determination of Total Nitrogen in Plant Materials with an Automatic Nitrogen Analyser,
W73-10530 5A

AVERAGE
Computation of Monthly Solid Precipitation from Total Monthly Precipitation and Average Monthly Air Temperature (Raschet mesyachnykh summ tverdykh osadkov po obshchim mesyachnym summam osadkov i srednim mesyachnym znacheniyam temperat ury vozdukha),
W73-10452 2C

AVOIDANCE REACTIONS
The Reactions of Roach (Rutilus rutilus (L.)) to Changes in the Concentration of Dissolved Oxygen and Free Carbon Dioxide in a Laboratory Channel,
W73-11011 5C

BACILLUS MEGATERIUM
Enteric Virus Survival in Algal-Bacterial Wastewater Treatment Systems-I. Laboratory Studies,
W73-11010 5D

BACKWATER
Comparison of Bridge Backwater Relations,
W73-10990 2E

BACTERIA
Characteristics of the Nearshore Environment off the South Coast of Anvers Island, Antarctic Peninsula,
W73-10520 5A

An Ecological Study of Three Fresh Water Ponds of Hyderabad-India: II. The Environment,
W73-10625 5C

Frozen Prepared Microbiological Culture Media,
W73-10857 5A

Distribution Pattern of Phytoplankton and Bacteria, Microbial Decomposition of Organic Matter and Bacterial Production in Eutrophic, Stratified Lake,
W73-10901 5C

Microbial Community Structure in Contaminated Estuarian Sediments,
W73-11025 5C

Method for Exposing Bacterial Cultures on Solid Media to a Defined Gas Mixture Using Nylon Bags,
W73-11049 5A

BACTERIAL POPULATIONS
Experimental Treatment of Surface Water Purification by Lagoons: Chemical and Microbiological Aspects, (Traitement Experimental d'Epuration d'Une eau de Surface Par Lanunage: Aspects Chimiques et Microbiologiques),
W73-11000 5B

BACTERIAL STALK ROT
Survival of Maize Bacterial Stalk Rot Pathogens in Infected Tissue Under Different Moisture and Temperature Conditions,
W73-10800 3F

BACTERIOLYTIC ACTIVITY
On the Isolation and the Bacteriolytic Activity of Some Myxobacteria Isolated in Water (Sur L'isolement Et L'activite Bacteriolytique de Quelques Myxobacteries Isolees De L'eau),
W73-10999 5A

BACTERIOPHAGE
Phage-Typing of Staphylococcus aureus,
W73-11012 5A

BALLAST WATER
Oily Water Separation System,
W73-10535 5G

BARATARIA BAY
The Gulf Environmental Program,
W73-10575 5G

BARK
The Influence of Benthic Bark Deposits on Aquatic Community and the Quality of Natural Waters,
W73-10411 4C

BARODA (WEST INDIA)
Photosynthetic Productivity in the Ajwa Reservoir at Baroda, West India,
W73-10925 5C

BASE FLOW
Stream Baseflow Prediction by Convolution of Antecedent Rainfall Effects,
W73-10675 2A

BASIC DATA COLLECTIONS
Base for a Model of the Slapy Reservoir Ecosystem,
W73-10916 5C

BAYESIAN DECISION ANALYSIS
A Sequential Decision Approach in Recreational Analysis,
W73-10619 6B

BAYS
Comparative Carbohydrate Geochemistry of Bay, Salt Marsh, and Deep Gulf Sediments,
W73-10972 2L

BEACH EROSION
Characteristics of Wave Records in the Coastal Zone,
W73-10979 8B

BEACHES
The Significance of Wave Parameters In the Sorting of Beach Pebbles,
W73-10431 2J

Onshore Transportation of Continental Shelf Sediment: Atlantic Southeastern United States,
W73-10767 2J

BED LOAD
Bed Material Characteristics and Transmission Losses in an Ephemeral Stream,
W73-10845 2E

BEECH
Seasonal Fluctuations in the Water Content of Various Plant Formations in Haute-Ardenne,
W73-10643 2I

BELGIUM
Comparative Study of the Plagiotheciaceae of Belgium with Regard to Certain Factors Influencing their Water Relationships with the Environment, (In French),
W73-10811 2I

BELGIUM (HAUTE-ARDENNE)
Seasonal Fluctuations in the Water Content of Various Plant Formations in Haute-Ardenne,
W73-10643 2I

BELLEROCHIA
Geographic Differences in Phytoplankton Sensitivity to PCBS,
W73-10849 5C

BENEFIT-COST ANALYSIS
Methodological Improvements in Measuring Economic Effects of Multipurpose Water Resource Projects.
W73-10417 6B

BENEFITS
A Sequential Decision Approach in Recreational Analysis,
W73-10619 6B

BENOMYL
Method for High-Speed Liquid Chromatographic Analysis of Benomyl and/or Metabolite Residues in Cow Milk, Urine, Feces, and Tissues,
W73-10547 5A

BENTHIC FAUNA
Effects of Kraft Mill Effluent on a Marine Benthic Community,
W73-10869 5C

The Bottom Fauna in an Oil-Contaminated Lake,
W73-10934 5C

BENTHIC FLORA
The Effect of Nutrient Fertilization on the Benthic Alga Ulva Lactuca,
W73-10944 5C

BENTHOS
The Influence of Benthic Bark Deposits on Aquatic Community and the Quality of Natural Waters,
W73-10411 4C

Bioturbation Rates and Effects in Carbonate Sand, St. John, U.S. Virgin Island,
W73-10984 2J

BERING SEA
Oxygen-Carbon Dioxide-Nutrients Relationships in the Northeastern Pacific Ocean and Southeastern Bering Sea,
W73-10532 5B

BERYLLIUM
Analysis of Soluble Beryllium By Gas Chromatography,
W73-10497 5A

BIBLIOGRAPHIES
Oil Spillage, A Bibliography, Volume 1.
W73-10556 5B

Oil Spillage, A Bibliography, Volume 2.
W73-10557 5B

Fatigue of Steel Weldments,
W73-10617 8G

Annotated Bibliography and Comments on Sedimentation in the Connecticut River,
W73-10728 2J

Cost Analysis of Water Pollution Control: An Annotated Bibliography,
W73-10879 5G

BIBLIOGRAPHIES

Bibliography on the Ecology and Taxonomy of Marine Algae,
W73-10949 5C

BIOACCUMULATION
The Uptake, Storage, and Release of Dieldrin and Some Effects of its Release in the Fish, Cichlasoma bimaculatum (Linnaeus),
W73-10536 5B

Some Trace Element Concentration Variations Observed in Marine Organisms that Suggest Caution in Sampling,
W73-11021 5A

BIOASSAY
Enhancement of Net Primary Productivity by Herbivore Grazing in Aquatic Laboratory Microcosms,
W73-10460 5C

Uptake and Biotransformation of Phenylmercuric Acetate by Aquatic Organisms,
W73-10477 5B

Methods of Estimating the Half-Life of Biological Activity of Toxic Chemicals in Water,
W73-10495 5C

Dynamics of a Salt of (2,4-Dichlorophenoxy) Acetic Acid in Fish, Water, and Hydrosol,
W73-10507 5C

The Uptake, Storage, and Release of Dieldrin and Some Effects of its Release in the Fish, Cichlasoma bimaculatum (Linnaeus),
W73-10536 5B

A Study of the Influence of Calcium on the Effects of DDT on Fishes,
W73-10537 5C

Population Dynamics and the Effect of Inorganic Ions on Certain Microcrustacea,
W73-10542 5C

Effect of Seawater Soluble Fraction of Kerosene on Chemotaxis in a Marine Snail, Nassarius Obsoletus,
W73-10872 5C

Algal Response to Detergent Phosphate Levels,
W73-11008 5C

The Reactions of Roach (Rutilus rutilus (L.)) to Changes in the Concentration of Dissolved Oxygen and Free Carbon Dioxide in a Laboratory Channel,
W73-11011 5C

BIOCHEMICAL CHARACTERISTICS
Radiation-Resistant Mutants of Salmonella typhimurium LT2: Development and Characterization,
W73-11029 5B

BIOCHEMICAL OXYGEN DEMAND
Unrecorded Pollution Sources and Optimum Water Quality Systems,
W73-10889 5B

A Note on the Prediction of Bod Profile Due to a Source of Effluent Discharged in a Uniformly Flowing Stream,
W73-10937 5B

BIOCHEMISTRY
Potential Heterotrophy in a Natural Population of Oscillatoria Agardhii Var. Isothrix Skuja,
W73-10946 5C

BIOCONTROL
Integration of Biological and Chemical Control of Alligator Weed,
W73-10960 3B

BIODEGRADATION
Structure Activity Correlations of Biodegradability of DDT Analogs,
W73-10504 5B

BIOGENIC OXIDATION
Effect of Ion Pairing on the pH of Seawater,
W73-10469 2K

BIOINDICATORS
Some Trace Element Concentration Variations Observed in Marine Organisms that Suggest Caution in Sampling,
W73-11021 5A

BIOLOGICAL COMMUNITIES
The Carbon Cycle in the Epilimnion of Two Michigan Lakes,
W73-10538 5C

Effects of Kraft Mill Effluent on a Marine Benthic Community,
W73-10869 5C

Lake George, Uganda. Studies on a Tropical Freshwater Ecosystem.
W73-10905 5C

Productivity of Aquatic Organism Communities of Different Trophic Levels in Kiev Reservoir,
W73-10911 5C

Microbial Community Structure in Contaminated Estuarian Sediments,
W73-11025 5C

BIOLOGICAL MAGNIFICATION
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

BIOLOGICAL SAMPLES
Rapid, Sensitive Method for Determination of Mercury in a Variety of Biological Samples,
W73-10483 5A

Analysis of Soluble Beryllium By Gas Chromatography,
W73-10497 5A

Trace Element Analysis by Proton-Induced X-Ray Excitation,
W73-10508 5A

Method for High-Speed Liquid Chromatographic Analysis of Benomyl and/or Metabolite Residues in Cow Milk, Urine, Feces, and Tissues,
W73-10547 5A

Separation and Preconcentration,
W73-10861 5A

Reduction of Mercury with Cysteine in Comminuted Halibut and Hake Fish Protein Concentrate,
W73-10878 5C

BIOLOGICAL TREATMENT
Enteric Virus Survival in Algal-Bacterial Wastewater Treatment Systems-I. Laboratory Studies,
W73-11010 5D

BIOMAGNIFICATION
Structure Activity Correlations of Biodegradability of DDT Analogs,
W73-10504 5B

BIOMASS
Some Interim Results of Soviet IBP Investigations on Lakes,
W73-10908 5C

Toxic Effects of Mercury on the Activated Sludge Process,
W73-11026 5C

BIOTRANSFORMATION
Uptake and Biotransformation of Phenylmercuric Acetate by Aquatic Organisms,
W73-10477 5B

BIOTURBATION
Bioturbation Rates and Effects in Carbonate Sand, St. John, U.S. Virgin Island,
W73-10984 2J

BIRGE-EKMAN BOX CORER
Modifications of the Birge-Ekman Box Corer for Use with Scuba or Deep Submergence Research Vessels,
W73-10486 7B

BLACK FLY LARVAE
Dependence of Black Fly Larvae Distribution on the Oxygen Content in the Water, The Speed of Flow and the Nutritive Value of Water Streams, (In Russian),
W73-10639 2I

BLACK SEA
Collection of Papers of the Hydrometeorological Observatory of the Black Sea and Sea of Azov Basins (Sbornik rabot Basseynovoy gidrometeorologicheskoy observatorii Chernogo i Azovskogo morey).
W73-10779 2K

Dynamics of Silicon in the Black Sea as Observed Along the Cape Khersones-Bosporus Profile (Dinamika kremniya v Chernom more po materialam nablyudeniy na razrezemys Khersones--proliv Bosfor),
W73-10780 2K

BLEACHED PULP WASTES
Oxygen Demand of Effluent from a Bleached Kraft Pulp Mill,
W73-10868 5A

BLIGHT
Bacterial Blight of Carrot in Wisconsin,
W73-10812 3F

BLOOD
Analysis of Soluble Beryllium By Gas Chromatography,
W73-10497 5A

The Determination of Trace Metals and Their Significance in Clinical Chemistry,
W73-11030 5A

BOATING
Computer Simulation of Recreational Boating Activities,
W73-10623 6A

BOD OXYGEN PROBE
Use of a BOD Oxygen Probe for Estimating Primary Productivity,
W73-10517 5A

BOREHOLES
Heat Flow and Precision Temperature Measurements in Boreholes,
W73-10786 8G

Acidizing Boreholes,
W73-10787 8A

BOSTON
Formation of Public Policy on Issue of Out-of-Basin Diversion of Connecticut River Flood Waters to Boston Metropolitan Area,
W73-10726 6B

Historical, Political and Social Factors Affecting Public Policy on River Diversion: Out-of-Basin Diversion of Connecticut River Flood Waters to the Boston Metropolitan Area,
W73-10727 3D

BOSTON (MASS.)
A Comparative Study of Resource Analysis Methods,
W73-10737 6A

BOTHRIOCEPHALUS-GOWKONGENSIS
The Discovery of Bothriocephalus gowkongensis Yeh. In the Basin of Kharkov Region, (In Russian),
W73-10631 8I

BOTTOM SEDIMENT SUGARS
Comparative Carbohydrate Geochemistry of Bay, Salt Marsh, and Deep Gulf Sediments,
W73-10972 2L

BOTTOM SEDIMENTS
Influence of Na3NTA and Na4 EDTA upon the Activation of Metals in River and Lake Sediments in Michigan,
W73-10408 5B

Seasonal Changes of the Number of Nitrogen Cycle Bacteria in Bottom Sediments of a Pool,
W73-10641 5C

Experiments on Bottom Sediment Movement by Breaking Internal Waves,
W73-10750 2J

Some Specific Problems in Understanding Bottom Sediment Distribution and Dispersal on the Continental Shelf,
W73-10762 2J

Organic Matter in the Eastern Sivash (Organicheskoye veshchestvo v Vostochnom Sivashe),
W73-10783 2K

The Distribution of Heavy Metals in Sediments of Sorfjord, West Norway,
W73-10865 5B

Bioturbation Rates and Effects in Carbonate Sand, St. John, U.S. Virgin Island,
W73-10984 2J

BOUSSINESQ EQUATION
Hydrologic Studies Using the Boussinesq Equation with a Recharge Term,
W73-10671 2F

BRAZOS RIVER (TEX)
Woody Phreatophytes Along the Brazos River and Selected Tributaries Above Possum Kingdom Lake,
W73-10745 3B

BREAKWATERS
Maximum Breaker Height,
W73-10975 8B

BREEDING
Breeding Places of Mosquitoes in the Area of the Oertze Lowland (Luenburger Heide): 1. Breeding Places of Aedes Punctor Kirby,
W73-10648 2I

BRIDGE DESIGN
The San Fernando Earthquake: A Lesson In Highway and Bridge Design,
W73-10612 8A

BRIDGE FAILURE
The San Fernando Earthquake: A Lesson In Highway and Bridge Design,
W73-10612 8A

BRIDGES
Comparison of Bridge Backwater Relations,
W73-10990 2E

BRINES
The Determination of Vandium in Brines by Atomic Absorption Spectroscopy,
W73-10442 5A

Organic Matter in the Eastern Sivash (Organicheskoye veshchestvo v Vostochnom Sivashe),
W73-10783 2K

The Application of Flameless Atomic Absorption in Hydrogenochemical Analysis,
W73-11039 2K

BRITISH ISLES
Sediment Transport Around the British Isles,
W73-10764 2J

BROTHS
Frozen Prepared Microbiological Culture Media,
W73-10857 5A

BROWN SOILS
Some Problems in the Water Regimen of Weakly Leached Cinnamon-Brown Soils in the Parkentsay River Basin (Nekotoryye voprosy vodnogo rezhima korichnevykh slabovyshchelochennykh pochv basseyna r. Parkentsay),
W73-10457 2G

Water Regime of Sod-Brown Soils and Relation of Tea-Leaf Yield to Precipitation (Vodnyy rezhim dernovo-burozemnykh pochv i zavisimost' urozhaya chaynogo lista ot osadkov),
W73-10776 2G

BUDGETING
A Budgeting and Linear Programming Analysis of Irrigation Water Values in Northern Wyoming,
W73-10699 3F

BULGARIA (PAZARDJIK)
On The Water Consumption of Wheat Grown in the Region of Pazardjik Irrigation system, (In Bulgarian),
W73-10636 3F

CABLE-TOOL DRILLING
Efficiency of Various Methods of Drilling Wells for Water Supply,
W73-10789 8A

CADMIUM
The Extraction of Divalent Cobalt, Copper, Zinc and Cadmium from Hydrochloric Acid Solutions by Tri-n-Butyl Phosphate,
W73-11050 5A

CAIRO (NEW YORK)
Town of Cairo Water Supply Report.
W73-10693 3D

CALCAREOUS SOILS
The Chalk-Stream Ecosystem,
W73-10921 5C

CALCITE
Dating Cave Calcite Deposits by the Uranium Disequilibrium Method: Some Preliminary Results from Crowsnest Pass, Alberta,
W73-10978 2J

CALCIUM
A Study of the Influence of Calcium on the Effects of DDT on Fishes,
W73-10537 5C

The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

The Limnology of Stockbridge Bowl, Stockbridge, Massachusetts,
W73-10561 5C

Comparison of Flame and Flameless Atomic Absorption for the Determination of Calcium,
W73-11037 2K

CALCIUM CARBONATE
Effect of Ion Pairing on the pH of Seawater,
W73-10469 2K

CALGARY (ALBERTA)
Discontinuity in Early Morning Evaporation,
W73-10672 2D

CALIBRATIONS
Initial Wetting Losses Incurred by Ground Level Stereo Gages,
W73-10659 2G

CALICHE
Influence of Surface and Near-Surface Caliche Distribution on Infiltration Characteristics and Flooding, Las Vegas Area, Nevada,
W73-10721 2E

CALIFORNIA
Methodological Improvements in Measuring Economic Effects of Multipurpose Water Resource Projects.
W73-10417 6B

Runoff Characteristics of California Streams,
W73-10447 2E

Marina Del Rey: A Study of Environmental Variables in a Semi-Enclosed Coastal Water,
W73-10465 5B

Multi-Sensor Detection and Tracking of Controlled Oil Spills,
W73-10467 5B

On the Storage of Seawater Samples for Ammonia Determination,
W73-10518 5A

(California Comprehensive Ocean Area Plan). Appendix I: Permanent Coastal Zone Data Inventory and Information System,
W73-10552 7C

California's Marine Program,
W73-10577 5G

The San Fernando Earthquake: A Lesson In Highway and Bridge Design,
W73-10612 8A

CALIFORNIA

Effects of Urbanization of Sedimentation and Floodflows in Colma Creek Basin, California,
W73-10653 4C

Electromagnetic Depth Sounding Experiment Across Santa Clara Valley,
W73-10720 4B

Sediment Transport on the Santa Barbara-Oxnard Shelf, Santa Barbara Channel, California,
W73-10760 2J

Sediment Textural Patterns on San Pedro Shelf, California (1951-1971): Reworking and Transport by Waves and Currents,
W73-10770 2J

Information Content of Time-Variant Data,
W73-10969 7C

CALIPER LOGGING
Find, Halt Corrosion in Well Casing now for Savings in the Future,
W73-10715 8G

CANADA
Pollution of the Marine Environment and the Effects Therefrom: The Case for Stricter Enforcement,
W73-10581 5C

Simulation of Hydrochemical Patterns in Regional Groundwater Flow,
W73-10664 2K

Discontinuity in Early Morning Evaporation,
W73-10672 2D

Oxygen Demand of Effluent from a Bleached Kraft Pulp Mill,
W73-10868 5A

Effects of Kraft Mill Effluent on a Marine Benthic Community,
W73-10869 5C

Preliminary Observations on Downslope Movement of Soil During the Fall in the Chinook Belt of Alberta,
W73-10977 2J

Dating Cave Calcite Deposits by the Uranium Disequilibrium Method: Some Preliminary Results from Crowsnest Pass, Alberta,
W73-10978 2J

CANAL SEEPAGE
Investigation of Natural Sealing Effects in Irrigation Canals,
W73-10404 4A

CANOPY
Predicting Degree Day Snow Melt Factors with Crown Closure in Arizona Ponderosa Pine,
W73-10697 2E

CAPE HATTERAS
Suspended Sediments in Continental Shelf Waters off Cape Hatteras, North Carolina,
W73-10758 2J

CARBAMATE PESTICIDES
Method for High-Speed Liquid Chromatographic Analysis of Benomyl and/or Metabolite Residues in Cow Milk, Urine, Feces, and Tissues,
W73-10547 5A

CARBOHYDRATES
Comparative Carbohydrate Geochemistry of Bay, Salt Marsh, and Deep Gulf Sediments,
W73-10972 2L

CARBON
Carbon in Freshwater Systems,
W73-10950 5C

Selective Determination of Hetero-Organics by a Dual-Channel Detector Based on Flame Conductivity and Emission,
W73-11040 5A

CARBON CYCLE
The Carbon Cycle in the Epilimnion of Two Michigan Lakes,
W73-10538 5C

CARBON DIOXIDE
Oxygen-Carbon Dioxide-Nutrients Relationships in the Northeastern Pacific Ocean and Southeastern Bering Sea,
W73-10532 5B

Processes Affecting the Oceanic Distribution of Carbon Dioxide,
W73-10534 5B

The Reactions of Roach (Rutilus rutilus (L.)) to Changes in the Concentration of Dissolved Oxygen and Free Carbon Dioxide in a Laboratory Channel,
W73-11011 5C

CARBON DIOXIDE LASER
Summary of CO2 Laser-Water Hyacinth Laboratory Research,
W73-10957 3B

CARBONATE ROCKS
Acidizing Boreholes,
W73-10787 8A

CARBONATE SANDS
Bioturbation Rates and Effects in Carbonate Sand, St. John, U.S. Virgin Island,
W73-10984 2J

CARBONATES
Process for Removing Metal Compound Contaminants From Waste Water,
W73-10584 5D

How Conditions Affect Reaction Rate of Well-Treating Acids,
W73-10707 8A

Bioturbation Rates and Effects in Carbonate Sand, St. John, U.S. Virgin Island,
W73-10984 2J

CARIBBEAN SEA
Phytoplankton Observations in the Eastern Caribbean Sea,
W73-11006 5A

CAROTENE
Effect of Climatic Factors on Alpha, Beta, Gamma Carotene and Xanthophyll Content in Corn Double Hybrids, (In Rumanian),
W73-10856 3F

CARP
Studies on the Carp Culture in Running Water Pond: V. Oxygen Supply and Consumption in the Fish Pond and Estimation of the Amount of Harvestable Fish in a Pond, (In Japanese),
W73-10815 2I

CARP (GRASS)
The Elements of Energy Balance in Grass Carp (Ctenopharyngodon idella Val.): II. Fish Fed With Animal Food,
W73-10638 8I

CARP PONDS
Observations on Primary Production of Phytoplankton in Two Fish Ponds,
W73-10924 5C

CARROT
Bacterial Blight of Carrot in Wisconsin,
W73-10812 3F

CATHODIC PROTECTION
Find, Halt Corrosion in Well Casing now for Savings in the Future,
W73-10715 8G

Fundamentals of Cathodic Protection,
W73-10784 8G

CATIONS
Studies in the Complex Formation of Metal Ions with Sugars. Part I. The Complex Formation of Cobalt (II), Cobalt (III), Copper (II) and Nickel (II) with Mannitol,
W73-10524 5B

Population Dynamics and the Effect of Inorganic Ions on Certain Microcrustacea,
W73-10542 5C

The Relationship Between Ions and Ciliary Activity in the Gill of Mytilus edulis,
W73-10543 5C

The Extraction of Divalent Cobalt, Copper, Zinc and Cadmium from Hydrochloric Acid Solutions by Tri-n-Butyl Phosphate,
W73-11050 5A

CAVITY WELLS
Formation of Cavity in Confined Aquifer,
W73-10996 8B

CEMENT GROUTING
Controlling Flowing Artesian Wells,
W73-10718 8A

A New Material to Cement Well Casing,
W73-10788 8F

CENTER-PIVOTS
Water Infiltration Under Center-Pivots,
W73-10698 3F

An Economic Analysis of Center-Pivot Sprinkler Irrigation Systems in Southeastern Wyoming, with Emphasis on Financing Alternatives,
W73-10700 3F

CENTRIFUGATION (DENSITY GRADIENT)
Density Gradient Centrifugation as an Aid to Sorting Planktonic Organisms: I. Gradient Materials,
W73-10813 2I

CERATOPHYLLUM DEMERSUM
Uptake and Biotransformation of Phenylmercuric Acetate by Aquatic Organisms,
W73-10477 5B

CERIODAPHNIA RETICULATA
The Extent of Consumption of the Energy Contained in the Food Suspension of Ceriodaphnia Reticulata (Jurine),
W73-10930 5C

CESIUM
Accumulation of Fallout Cesium 137 in Soils and Sediments in Selected Watersheds,
W73-10667 5B

CHALK-STREAMS
The Chalk-Stream Ecosystem,
W73-10921 5C

CHAMPAIGN-URBANA (ILL)
Lead Outputs in Streamflow from a Watershed Ecosystem,
W73-10673 5B

CHANNEL MORPHOLOGY
Bed Material Characteristics and Transmission Losses in an Ephemeral Stream,
W73-10845 2E

CHAPARRAL
Converting Chaparral to Grass to Increase Streamflow,
W73-10831 3B

CHAR LAKE (CANADA)
The Char Lake Project. A Study of Energy Flow in a High Arctic Lake,
W73-10904 5C

CHARLOTTE AMALIE HARBOR (V I)
Water Quality Determinations In the Virgin Islands from ERTS-A Data,
W73-10437 5B

CHELATION
Influence of Na3NTA and Na4 EDTA upon the Activation of Metals in River and Lake Sediments in Michigan,
W73-10408 5B

CHEMCONTROL
Aquatic Plant Control Program.
W73-10951 4A

CHEMICAL ANALYSIS
Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Price River Basin, Utah,
W73-10423 2K

Determination of Nanogram Levels of Silver in Suspended Materials of Streams Retained by A Membrane Filter with the 'Sampling-Boat' Technique,
W73-10429 2K

A Rapid Sensitive Method For the Determination of the Chemical Oxygen Demand of Polluted Waters,
W73-10434 5A

The Determination of Vandium in Brines by Atomic Absorption Spectroscopy,
W73-10442 5A

Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

Gas-Liquid-Solid Chromatography of Free Acids,
W73-10473 5A

Rapid, Sensitive Method for Determination of Mercury in a Variety of Biological Samples,
W73-10483 5A

Gas Chromatographic Determination of Ethylene Thiourea Residues,
W73-10494 5A

The Determination of Manganese in Urine by Atomic Absorption Spectrometry,
W73-10528 5A

The Fluorimetric Determination of Phosphate with Thiamine,
W73-10529 5A

The Determination of Total Nitrogen in Plant Materials with an Automatic Nitrogen Analyser,
W73-10530 5A

Atomic Fluorescence Characteristics of Copper in Various Premixed Flames,
W73-10531 5A

Gas Chromatography of Organonitrogen Pesticides, Using a Nitrogen-Specific Detection System,
W73-10548 5A

Sodium and Magnesium Sulfate Ion Pairing: Evidence from Raman Spectroscopy,
W73-10650 1B

Inorganic Phosphorus in Seawater,
W73-10680 2K

A Simple Modification of a Flame Photometer for Routine Trace Potassium Analysis,
W73-10852 5A

Fast Liquid Chromatography,
W73-11022 5A

CHEMICAL DEGRADATION
Hydrolysis of Aqueous Solutions of Sodium 2,2-Dichloropropionate Under Self-Induced Alkaline Conditions,
W73-10506 5B

CHEMICAL ELEMENTS
New Methods for the Determination of Elements in Trace Amounts,
W73-10862 5A

CHEMICAL EQUILIBRIUM
Chemical Equilibrium Models of Lake Keystone, Okla.,
W73-10480 5B

CHEMICAL GROUTS
Investigation of use of Gel Material for Mine Sealing,
W73-10880 5G

CHEMICAL INDUSTRY
Chemical Panel Report,
W73-10578 5G

CHEMICAL IONIZATION MASS SPECTROMETRY
Studies in Chemical Ionization Mass Spectrometry,
W73-10541 5A

CHEMICAL OXYGEN DEMAND
A Rapid Sensitive Method For the Determination of the Chemical Oxygen Demand of Polluted Waters,
W73-10434 5A

Toxic Effects of Mercury on the Activated Sludge Process,
W73-11026 5C

CHEMICAL PRECIPITATION
Well Stimulation--How Acids Behave in Solution,
W73-10792 8A

CHEMICAL PROPERTIES
Phytoplankton Production, Chemical and Physical Conditions in Loch Leven,
W73-10922 5C

Comparison of the Physical and Chemcial Environments of Volta Lake and Lake Nasser,
W73-10931 5C

Experimental Treatment of Surface Water Purification by Lagoons: Chemical and Microbiological Aspects, (Traitement Experimental d'Epuration d'Une eau de Surface Par Lanunage: Aspects Chimiques et Microbiologiques),
W73-11000 5B

CHEMICAL REACTIONS
Studies in Chemical Ionization Mass Spectrometry,
W73-10541 5A

How Conditions Affect Reaction Rate of Well-Treating Acids,
W73-10707 8A

Microdetermination of Formic, Oxalic and Acetic Acids in Their Mixture by Selective Oxidation,
W73-10860 5A

CHEMICAL RECOVERY
The p-Value Approach to Quantitative Liquid-Liquid Extraction of Pesticides and Herbicides from Water. 2. Selection of Water: Solvent Ratios and Number of Extractions,
W73-10505 5A

CHEMICAL TREATMENT
Apparatus for Monitoring and Controlling Halogen Levels in a Water Treatment System,
W73-10593 5F

CHEMICAL WASTES
Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

Chemical Panel Report,
W73-10578 5G

CHEMISTRY OF PRECIPITATION
Influence of Vegetation and Substrate on Streamwater Chemistry in Northern Utah,
W73-10413 5B

CHESAPEAKE BAY
Migration of Tidal Sand Waves in Chesapeake Bay Entrance,
W73-10765 2J

Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W73-10982 2L

Ecology of Vibrio parahaemolyticus in Chesapeake Bay,
W73-11001 5C

CHICOPEE (MASS)
The Origin, Effects and Control of Turbidity in an Urban Recreational Lake,
W73-10406 5B

CHLORELLA PYRENOIDOSA
The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

CHLORIDES
Oxygen Demand of Effluent from a Bleached Kraft Pulp Mill,
W73-10868 5A

CHLORINATED HYDROCARBON PESTICIDES
Marina Del Rey: A Study of Environmental Variables in a Semi-Enclosed Coastal Water,
W73-10465 5B

UNIV. OF ILL. URBANA - CHAMPAIGN

CHLORINATED HYDROCARBON PESTICIDES

Reverse Phase Thin Layer Chromatography of Some Aroclors, Halowaxes, and Pesticides,
W73-10492 5A

Hydrolysis of Aqueous Solutions of Sodium 2,2-Dichloropropionate Under Self-Induced Alkaline Conditions,
W73-10506 5B

Chlorinated Hydrocarbon Pesticides and Related Compounds in Adipose Tissue from People of Japan,
W73-10854 5A

CHLORINATED HYDROCARBONS
Occurrence of some Chlorinated Aliphatic Hydrocarbons in the Environment,
W73-10850 5B

CHLORINATED NAPHTHALENES
Reverse Phase Thin Layer Chromatography of Some Aroclors, Halowaxes, and Pesticides,
W73-10492 5A

CHLORINATION
Evaluation of Coliform Tests for Chlorinated Secondary Effluents,
W73-11002 5A

CHLOROMONADS
Freshwater Algae From the Itasca State Park Minnesota, IV. Cyanophta, Rhodophyta, Chloromonadophyceae, and Cryptophyceae,
W73-10544 5A

CHLOROPHYLL A
An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

CHLOROPHYTA
A New Species of Pseudocodium (Chlorophyta, Siphonales) from the West Coast of Florida,
W73-10470 5A

CHROMATOGRAPHY
Modification of an Isco Drum Fraction Collector to Permit Use of Stoppered Test Tubes,
W73-10513 5A

Fast Liquid Chromatography,
W73-11022 5A

Detection of Organo-Phosphorus Pesticide Residues in Autopsy Tissues by Thin-Layer Chromatography,
W73-11023 5A

CHROMIUM
The Extraction of the Chromium (III)-Edta Complex by Solutions of Aliquat-336 in Various Organic Solvents,
W73-10523 5A

The Direct Determination of Chromium in Urine by Selective Volatilization with Atom Reservoir Atomic Absorption,
W73-10525 5A

CHROMTOGRAPHIC COLUMNS
Larger Diameter Columns for Modern, High Speed Liquid Chromatography,
W73-10539 2K

CICHLASOMA BIMACULATUM
The Uptake, Storage, and Release of Dieldrin and Some Effects of its Release in the Fish, Cichlasoma bimaculatum (Linnaeus),
W73-10536 5B

CILIARY ACTIVITY
The Relationship Between Ions and Ciliary Activity in the Gill of Mytilus edulis,
W73-10543 5C

CINCINNATI (OHIO)
Development of Design Storm Hyetographs for Cincinnati, Ohio,
W73-10679 2B

CITIES
Town of Cairo Water Supply Report.
W73-10693 3D

CLARIFICATION (WATER)
Filtration Process for Clarification,
W73-10606 5F

CLAY MINERALS
Chemical Interactions of Aluminum with Aqueous Silica at 25 degrees C,
W73-10433 2K

The Eutrophication Implications of Interactions Between Naturally Occurring Particulates and Methane Oxidizing Bacteria,
W73-10893 5C

CLAYS
Seasonal Dynamics of Claying Meadow Soil of the Alazan Valley, (in Azerbaijani),
W73-10940 2G

CLIMATES
Frequency Analyses of the Ratio of Actual to Potential Evapotranspiration for the Study of Climate and Vegetation Relationships,
W73-10421 2D

CLONES
Geographic Differences in Phytoplankton Sensitivity to PCBS,
W73-10849 5C

CLOSED CONDUITS
Dividing Flow in Closed Conduits,
W73-10608 8B

CLOSTRIDIUM
Halogenated Compounds for the Sensitive Detection of Clostridia by Gas Chromatography,
W73-10550 5A

CLOUD SEEDING
Weather Modification in Arizona, 1971,
W73-10832 3B

CLOUDS
Weather Modification in Arizona, 1971,
W73-10832 3B

COAGULATION
Waste Water Treatment,
W73-10586 5D

Filtration Process for Clarification,
W73-10606 5F

COASE THEOREM
Pricing of Pollution: The Coase Theorem in the Long Run,
W73-10740 5G

COASTAL ENGINEERING
Maximum Breaker Height,
W73-10975 8B

COASTAL MARSHES
Beneficial Aquatic Plants in Coastal Areas,
W73-10955 3B

Trace Metals in Cores from the Great Marsh, Lewes, Delaware.
W73-10971 2J

COASTAL PLAINS
Water Circulation and Sedimentation at Estuary Entrances on the Georgia Coast,
W73-10766 2J

Linear Shoals on the Atlantic Inner Continental Shelf, Florida to Long Island,
W73-10768 2J

COASTAL STRUCTURES
Maximum Breaker Height,
W73-10975 8B

COASTAL WATERS
Heavy Metals in British Waters,
W73-10851 5B

Organic Mercury Compounds in Coastal Waters,
W73-10855 5A

Ecological Significance of the Discharge of Treated Waste Waters into Coastal Waters,
W73-10876 5C

COASTS
The Evolution of Lewes Harbor,
W73-10438 2J

(California Comprehensive Ocean Area Plan). Appendix I: Permanent Coastal Zone Data Inventory and Information System,
W73-10552 7C

The State of Marine Pollution in the Mediterranean and Legislative Controls.
W73-10553 5B

Heavy Metals in Estuaries and the Coastal Zone,
W73-10555 5B

Department of Interior Program,
W73-10571 5G

Federal Interaction with States,
W73-10572 5G

Delaware Marine Related Study,
W73-10574 5G

The Gulf Environmental Program,
W73-10575 5G

Report of Study on Ships Channels and Harbors,
W73-10576 5G

California's Marine Program,
W73-10577 5G

Ocean Utilization and Coastal Zone Development.
W73-10579 2L

Pollution of the Marine Environment and the Effects Therefrom: The Case for Stricter Enforcement,
W73-10581 5C

Coastal Erosion in the Nile Delta,
W73-10681 2J

Wave Estimates for Coastal Regions,
W73-10751 2J

COBALT
Study of the Contamination of Arenicola Marina L. by Cobalt-60, (Etude de la Con-

tamination d'Arenicola Marina L. (Annelide Polychete) Par LM Cobalt-60),
W73-10551 5C

Titrimetric Microdetermination of Nickel and Cobalt, Separately and in Presence of each Other,
W73-10863 5A

The Extraction of Divalent Cobalt, Copper, Zinc and Cadmium from Hydrochloric Acid Solutions by Tri-n-Butyl Phosphate,
W73-11050 5A

COLIFORMS
Microbial Changes and Possible Ground Water Pollution from Poultry Manure and Beef Cattle Feedlots in Georgia,
W73-10403 5B

COLMA CREEK BASIN (CALIF.)
Effects of Urbanization of Sedimentation and Floodflows in Colma Creek Basin, California,
W73-10653 4C

COLOR
Color It Evaporation,
W73-10829 2D

COLORADO
A Predictive Model for Upper Rio-Grande Index Flows,
W73-10620 4A

Field Experiments on Freezing and Thawing at 3.350 Meters in the Rocky Mountains of Colorado, U.S.A.,
W73-10976 2C

COLORADO RIVER
An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

COLORADO RIVER BASIN (TEX)
Stochastic Models Applied to Operation of Reservoirs in the Upper Colorado River Basin in Texas,
W73-10565 2A

COLORADO RIVER OUTFITTERS ASSOCIATION
An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

COLORIMETRY
Dry Ashing Technique for the Determination of Arsenic in Marine Fish,
W73-10482 5A

Residues of MS-222 in Northern Pike, Muskellunge, and Walleye,
W73-10496 5A

COLUMBIA RIVER
Trace Element Analyses of Columbia River Water and Phytoplankton,
W73-10806 5A

Correlated Studies of Vancouver Lake-Hydraulic Model Study,
W73-10881 5B

COLUMN PREPARATION
Larger Diameter Columns for Modern, High Speed Liquid Chromatography,
W73-10539 2K

COMETABOLISM
Halogenated Compounds for the Sensitive Detection of Clostridia by Gas Chromatography,
W73-10550 5A

COMMON-MODE ISOLATION
Digital-to-Analog Converter Having Common-Mode Isolation and Differential Output,
W73-11019 7C

COMPETITION
Competition Between an Alga and an Aquatic Bacterium for Phosphate,
W73-10894 5C

COMPLEXATION
Studies in the Complex Formation of Metal Ions with Sugars. Part I. The Complex Formation of Cobalt (II), Cobalt (III), Copper (II) and Nickel (II) with Mannitol,
W73-10524 5B

COMPREHENSIVE PLANNING
The Development of A Plan of Study--An Interagency Approach to Multiobjective Planning and Evaluation of Water and Land Resource Use,
W73-10622 6A

Town of Cairo Water Supply Report.
W73-10693 3D

COMPUTER MODELS
Computer Simulation of Recreational Boating Activities,
W73-10623 6A

W.A.L.R.U.S. I Water and Land Resource Utilization Simulation,
W73-10735 6A

Correlated Studies of Vancouver Lake-Hydraulic Model Study,
W73-10881 5B

Correlated Studies of Vancouver Lake - Water Quality Prediction Study,
W73-10882 5B

COMPUTER PROGRAMS
A Finite Element Solution for Two-Dimensional Density Stratified Flow,
W73-10418 2H

W.A.L.R.U.S. I Water and Land Resource Utilization Simulation,
W73-10735 6A

CSS: A Computer Program for Modeling Ecological Systems,
W73-10736 6A

A Comparative Study of Resource Analysis Methods,
W73-10737 6A

Hydrologic Modeling, Parameter Estimation, and Watershed Characteristics,
W73-10964 2A

CONCRETE CONSTRUCTION
Suggested Design and Construction Procedures for Pier Foundations.
W73-10611 8F

CONCRETE PIPES

What is the Role of Flood Flows in the Pollution of the Connecticut River and its Amelioration,
W73-10731 5B

A Study of the Probable Effects of the Diversion of Flood Waters Upon the Ecology of the Connecticut River Estuary,
W73-10732 2L

Role of Connecticut River Flood Flows in Recharging Ground-Water Formations,
W73-10733 4B

DMA-2 4-D
Dynamics of a Salt of (2,4-Dichlorophenoxy) Acetic Acid in Fish, Water, and Hydrosol,
W73-10507 5C

DOLLS MEADOW
The Effects of Pollution on Gammarus Pulex (L) Subsp, Pulex (Schellenberg) in the Inlet Streams of Rostherne Mere, Cheshire,
W73-11047 5C

DOMESTIC WASTES
The State of Marine Pollution in the Mediterranean and Legislative Controls.
W73-10553 5B

The Feasibility of Flow Smoothing Stations in Municipal Sewage Systems,
W73-10722 5D

DOMINANT ORGANISMS
Diatoms in Alkaline, Saline Lakes: Ecology and Geochemical Implications,
W73-10545 5C

DON RIVER
Dynamics of Mineral and Organic Phosphorus in the Sea of Azov After, Regulation of Don River Flow (Dinamika mineral'nogo i organicheskogo fosfora v Azovskom more posle zaregulirovaniya stoka reki Dona),
W73-10782 2K

DOUGLAS FIR TREES
Influence of Vegetation and Substrate on Streamwater Chemistry in Northern Utah,
W73-10413 5B

DRAG
Computing Evapotranspiration by Geostrophic Drag Concept,
W73-10970 2D

DRAINAGE
Effects of Mosquito Control Ditching on Estuarine Ecosystems,
W73-10410 5G

Nitrate Reduction in the Vicinity of Tile Drains,
W73-10560 5B

DRAINAGE SYSTEMS
Drainage Coefficient for Surface Drainage of Agricultural Land for Different Parts of the Country,
W73-10997 3F

DRAWDOWN
Unsteady Flow Twoard an Artesian Well,
W73-10967 4B

Effect of a Water Table Aquitard on Drawdown in an Underlying Pumped Aquifer,
W73-10968 4B

Water-Level Decline and Pumpage in Deep Wells in Northern Illinois, 1966-1971,
W73-10993 4B

DREDGING
Correlated Studies of Vancouver Lake - Water Quality Prediction Study,
W73-10882 5B

DRILLING
Drilling for Water in New England,
W73-10796 8A

DRILLING EQUIPMENT
Hydraulic Jetting, Drilling Tool Aids Directional Work,
W73-10717 8C

Efficiency of Various Methods of Drilling Wells for Water Supply,
W73-10789 8A

Well Drilling in Southeast Asia,
W73-10795 8A

Air Blast Drilling with Rotary Rock Bits,
W73-10797 8C

DRILLING FLUIDS
A New Material to Cement Well Casing,
W73-10788 8F

DRILLING PARAMETERS
Lowest Cost-Per-Foot is Aim of Own Calculations,
W73-10791 8G

DROUGHT RESISTANCE (PLANTS)
Resistance to Drought of Some Corn Single Hybrids Developed at the ICCPT-Fundulea and of Their Component Lines, (In Rumanian),
W73-10864 3F

DROUGHTS
The Metropolis Runs Dry,
W73-10686 6E

DRY ASHING
Dry Ashing Technique for the Determination of Arsenic in Marine Fish,
W73-10482 5A

DRY BEDS
Some Characteristics of a Shallow Endorheic Lake in its Drying Phase and its Revovery Phase. Lake Chilwa (Malawi),
W73-10932 5C

DRY FARMING
The Effect of Plowing Under Corn Straw on Some Soil Properties and the Yield of Corn Under Conditions of Dry Farming and Irrigation, (In Serbo-Croatran),
W73-10637 3F

DYE RELEASES
Tracer Simulation Study of Potential Solute Movement in Port Royal Sound, South Carolina,
W73-10446 5B

DYNAMIC PROGRAMMING
Optimal Feedback Control - A Synopsis,
W73-10887 7C

DYNAMIC ROUTING
Effects of Time Step Size in Implicit Dynamic Routing,
W73-10676 2E

E. COLI
Osmotic Reversal of Temperature Sensitivity in Escherichia coli,
W73-11028 5C

EAGLE RIVER (ALASKA)
Flood Plain Information--Meadow Creek, Eagle River, Alaska.
W73-10981 4A

EARTHQUAKE-RESISTANT STRUCTURES
The San Fernando Earthquake: A Lesson In Highway and Bridge Design,
W73-10612 8A

EARTHQUAKES
An Investigation of the Sesmic Wave Propagation Properties of a Thin Unsaturated Layer as a Wave Guide,
W73-10888 4B

EAST AFRICA
Diatoms in Alkaline, Saline Lakes: Ecology and Geochemical Implications,
W73-10545 5C

ECOLOGY
A Study of the Probable Effects of the Diversion of Flood Waters Upon the Ecology of the Connecticut River Estuary,
W73-10732 2L

CSS: A Computer Program for Modeling Ecological Systems,
W73-10736 6A

Bibliography on the Ecology and Taxonomy of Marine Algae,
W73-10949 5C

ECOLOGY MOVEMENT
Mobilization and Participation of Citizens Groups in Improving the Quality of Water Resources Environments,
W73-10409 6B

ECONOMIC FEASIBILITY
Potentials for a Delaware Deepwater Port.
W73-10690 3E

An Economic Analysis of Center-Pivot Sprinkler Irrigation Systems in Southeastern Wyoming, with Emphasis on Financing Alternatives,
W73-10700 3F

The Feasibility of Flow Smoothing Stations in Municipal Sewage Systems,
W73-10722 5D

ECONOMIC IMPACT
Local Economic Impact of Reservoir Recreation,
W73-10415 6B

Values and Cost Allocations of Surface-Water Use and Treatment,
W73-10558 6B

An Economic Evaluation of a Water-Based Urban Tourist Attraction in San Antonio, Texas,
W73-10564 6B

An Economic Analysis of Center-Pivot Sprinkler Irrigation Systems in Southeastern Wyoming, with Emphasis on Financing Alternatives,
W73-10700 3F

ECONOMIC IMPACTS
Methodological Improvements in Measuring Economic Effects of Multipurpose Water Resource Projects.
W73-10417 6B

ECONOMIC JUSTIFICATION
Surface-Hole Techniques Should be Simple and Cheap,
W73-10706 8A

ECONOMIC MODELS
An Economic Model of an Area's Response to Depletion of its Water Resources,
W73-10405 4B

ECOSYSTEMS
The Evaluation of Small Bodies of Water as Functional Ecological Units and Consequences for Ecological Terminology, (In German),
W73-10640 2H

CSS: A Computer Program for Modeling Ecological Systems,
W73-10736 6A

The Modelling of the Ecosystem of Lake Dalnee on an Electronic Computer,
W73-10899 5C

The Uniqueness of Salt Lake Ecosystems,
W73-10907 5C

The Chalk-Stream Ecosystem,

Observations on Primary Production of Phytoplankton in Two Fish Ponds,
W73-10924 5C

The Primary Productivity of a Fish-Pond at Ile-Ife, Nigeria,
W73-10928 5C

FISH FOOD
The Elements of Energy Balance in Grass Carp (Ctenopharyngodon idella Val.): II. Fish Fed With Animal Food,
W73-10638 8I

FISH FOOD ORGANISMS
Intensification of Fish Ponds Production,
W73-10919 5C

FISH HARVEST
Energy Flow in Aquatic Ecosystems in India,
W73-10912 5C

Energy Transformations Through Primary Productivity and Fish Production in Some Tropical Freshwater Impoundments and Ponds,
W73-10915 5C

Intensification of Fish Ponds Production,
W73-10919 5C

FISH POPULATION
Trophic Structure of Lake Tatsu-Numa, An Acidotrophic Lake in Japan, With Special Reference to the Importance of the Terrestrial Community,
W73-10910 5C

FISH PROCESSING PLANTS
Salmonellae and Edwardsiella Tarda in Gull Feces: A Source of Contamination in Fish Processing Plants,
W73-10463 5B

FJORDS
Deep Water Renewal in Saanich Inlet, an Intermittently Anoxic Basin,
W73-10432 5B

FLAME IONIZATION DETECTOR
Selective Determination of Hetero-Organics by a Dual-Channel Detector Based on Flame Conductivity and Emission,
W73-11040 5A

FLAME IONIZATION GAS CHROMATOGRAPHY
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Hydrolysis of Aqueous Solutions of Sodium 2,2-Dichloropropionate Under Self-Induced Alkaline Conditions,
W73-10506 5B

Gas Chromatographic Separation, by Carbon Number and Hydrocarbon Type, of Saturated Hydrocarbon Mixtures and Different Naphthas Over Molecular Sieves 13X,
W73-11035 5A

FLAME PHOTOMETRIC GAS CHROMATOGRAPHY
Gas Chromatographic Determination of Ethylene Thiourea Residues,
W73-10494 5A

FLAME PHOTOMETRY
A Simple Modification of a Flame Photometer for Routine Trace Potassium Analysis,
W73-10852 5A

FLAMELESS ATOMIC ABSORPTION SPECTROPHOTOMETRY
Rapid, Sensitive Method for Determination of Mercury in a Variety of Biological Samples,
W73-10483 5A

Organic Mercury Compounds in Coastal Waters,
W73-10855 5A

Comparison of Flame and Flameless Atomic Absorption for the Determination of Calcium,
W73-11037 2K

The Application of Flameless Atomic Absorption in Hydrogenochemical Analysis,
W73-11039 2K

FLAMMABLE GASES
Gas in Ground Water.
W73-10713 4B

FLASH DISTILLATION
Multiple Expansion Flash Evaporator Comprising A Continuous Casing With A Central Evaporation Chamber,
W73-10601 3A

FLASH FLOODS
Influence of Surface and Near-Surface Caliche Distribution on Infiltration Characteristics and Flooding, Las Vegas Area, Nevada,
W73-10721 2E

FLINT (MICH)
Application of Selected Industrial Engineering Techniques to Waste Water Treatment Plants,
W73-10723 5D

FLOATING PLANTS
Growth of a Floating Aquatic Weed, Salvinia Under Standard Conditions,
W73-11007 5C

FLOCCULATION
Dewatering of Mine Drainage Sludge -Phase II,
W73-10724 5D

FLOOD CONTROL
Influence of Surface and Near-Surface Caliche Distribution on Infiltration Characteristics and Flooding, Las Vegas Area, Nevada,
W73-10721 2E

FLOOD DAMAGE
Floods in New York--1969,
W73-10655 2E

Flood Plain Information--Meadow Creek, Eagle River, Alaska.
W73-10981 4A

FLOOD DATA
Floods in New York--1969,
W73-10655 2E

Flood Plain Information--Meadow Creek, Eagle River, Alaska.
W73-10981 4A

FLOOD FLOW
The Role of Flood Flows in Nutrient Supply and Removal as a Factor in the Eutrophication of the Connecticut River,
W73-10730 5C

FLOOD FORECASTING
A Solution to Small Sample Bias in Flood Estimation,
W73-10840 2E

A Proposed Model for Flood Routing in Abstracting Ephemeral Channels,
W73-10844 2E

FLOOD FREQUENCY
Flood Plain Information--Meadow Creek, Eagle River, Alaska.
W73-10981 4A

FLOOD PEAK
Floods in New York--1969,
W73-10655 2E

FLOOD PLAIN MANAGEMENT
Model Flood Plain Zoning Ordinance,
W73-10691 6F

FLOOD PLAIN ZONING
Model Flood Plain Zoning Ordinance,
W73-10691 6F

FLOOD PLAINS
Hydrological Studies of the Upper Paraguay River Basin (Pantanal Region, Mato Grosso State, Brazil),
W73-10682 2E

Model Flood Plain Zoning Ordinance,
W73-10691 6F

FLOOD ROUTING
A Proposed Model for Flood Routing in Abstracting Ephemeral Channels,
W73-10844 2E

FLOOD WATER DIVERSIONS
An Evaluation of the Possible Effects of Water Diversion of the Connecticut River on the Biology of Anadromous Fish in the River,
W73-10729 2I

FLOODS
Floods in New York--1969,
W73-10655 2E

Sediment Transport on the Santa Barbara-Oxnard Shelf, Santa Barbara Channel, California,
W73-10760 2J

Flood Plain Information--Meadow Creek, Eagle River, Alaska.
W73-10981 4A

FLORIDA
A New Species of Pseudocodium (Chlorophyta, Siphonales) from the West Coast of Florida,
W73-10470 5A

FLOW MEASUREMENT
Some Results and Ways of Developing Methods of Streamflow Measurement in Mountain Countries (Nekotoryye itogi i puti razvitiya sposobov rascheta stoka v usloviyakh gornykh stran),
W73-10449 7B

FLOW PROFILES
Comparison of Bridge Backwater Relations,
W73-10990 2E

The Effect of Silting on Flow Profile Upstream of Weirs--A Case Study,
W73-10994 8B

FLOW SMOOTHING
The Feasibility of Flow Smoothing Stations in Municipal Sewage Systems,
W73-10722 5D

FLOWING ARTESIAN WELLS
Controlling Flowing Artesian Wells,
W73-10718 8A

FLUID FRICTION
Friction Factor and Reynolds Number in Porous Media Flow,
W73-10991 2F

FLUORIDES
Direct Measurement of Less Than 1 Part-Per-Billion Fluoride in Rain, Fog, and Aerosols with an Ion-Selective Electrode,
W73-10526 5A

FLUORODIFEN
Direct Titrimetric Microdetermination of Fluorodifen, Linuron, Faneron, and Pebulate,
W73-10481 5A

FLUOROMETRY
A Rapid Sensitive Method For the Determination of the Chemical Oxygen Demand of Polluted Waters,
W73-10434 5A

The Fluorimetric Determination of Phosphate with Thiamine,
W73-10529 5A

FLY ASH
Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

FOG
Direct Measurement of Less Than 1 Part-Per-Billion Fluoride in Rain, Fog, and Aerosols with an Ion-Selective Electrode,
W73-10526 5A

FOOD CHAINS
Towards Production Biology in Running Water Ecosystems,
W73-10871 5C

Productivity Problems of Freshwaters.
W73-10895 5C

Results of the Study of Some Links of the Food Chain in a Carp Pond in Czechoslovakia,
W73-10917 5C

FOOD CONTAMINATION
Salmonellae and Edwardsiella Tarda in Gull Feces: A Source of Contamination in Fish Processing Plants,
W73-10463 5B

FOOD (FISH)
Food Supply of Roach Underyearlings Rutilus rutilus (L.) in the Mozhaiskii Reservoir (In Russian),
W73-10458 2H

FOOD WEBS
The Evaluation of Small Bodies of Water as Functional Ecological Units and Consequences for Ecological Terminology, (In German),
W73-10640 2H

FORECASTING
Peatmos Probability of Precipitation Forecasts as an Aid in Predicting Precipitation Amounts,
W73-10426 2B

A Predictive Model for Upper Rio-Grande Index Flows,
W73-10620 4A

Predicting Degree Day Snow Melt Factors with Crown Closure in Arizona Ponderosa Pine,
W73-10697 2E

Water Use, (AWWA Committee Report).
W73-10741 6D

FOREST WATERSHEDS
An Analysis of Yearly Differences in Snowpack Inventory Prediction Relationships,
W73-10821 2C

FORMIC ACID
Microdetermination of Formic, Oxalic and Acetic Acids in Their Mixture by Selective Oxidation,
W73-10860 5A

FOUNDATIONS
Suggested Design and Construction Procedures for Pier Foundations.
W73-10611 8F

FRACTION COLLECTOR
Modification of an Isco Drum Fraction Collector to Permit Use of Stoppered Test Tubes,
W73-10513 5A

FRACTURES (GEOLOGIC)
A Model Study of Rock-Joint Deformation,
W73-10607 8E

FRAGILARIA PINNATA
Geographic Differences in Phytoplankton Sensitivity to PCBS,
W73-10849 5C

FRANCE (LYON)
Ranunculus Fluitans Lamarck in Lyon,
W73-10646 5B

FREEZING
On the Storage of Seawater Samples for Ammonia Determination,
W73-10518 5A

Frozen Prepared Microbiological Culture Media,
W73-10857 5A

Field Experiments on Freezing and Thawing at 3.350 Meters in the Rocky Mountains of Colorado, U.S.A.,
W73-10976 2C

FREQUENCY DISTRIBUTION
Transmissivity Distribution in the Tucson Basin Aquifer,
W73-10827 2F

FRESH WATER FISH
Nature of Larval and Juvenile Growth of Some Freshwater Fish at Different States of Development, (in Russian),
W73-10468 2I

FRESHWATER
Release of Ammonium-N from Sediments to Waters,
W73-10939 5B

Carbon in Freshwater Systems,
W73-10950 5C

FRICTION
Internal Friction of Single-Crystal Ice,
W73-10652 2C

FROST ACTION
Field Experiments on Freezing and Thawing at 3.350 Meters in the Rocky Mountains of Colorado, U.S.A.,
W73-10976 2C

FUEL OIL
Development of an Oil/Water Pollution Monitor,
W73-10491 5A

FUMIGANTS
Method for High-Speed Liquid Chromatographic Analysis of Benomyl and/or Metabolite Residues in Cow Milk, Urine, Feces, and Tissues,
W73-10547 5A

FUNGICIDES
Control of Algae,
W73-10945 5C

GALVANIC CELLS
Underground Corrosion and Salt Infiltration,
W73-10712 4C

GAMING-SIMULATION
W.A.L.R.U.S. I Water and Land Resource Utilization Simulation,
W73-10735 6A

GAMMARUS PULEX
The Effects of Pollution on Gammarus Pulex (L) Subsp, Pulex (Schellenberg) in the Inlet Streams of Rostherne Mere, Cheshire,
W73-11047 5C

GAS CHROMATOGRAPHY
Analysis of Soluble Beryllium By Gas Chromatography,
W73-10497 5A

Simplified Gas Chromatographic Procedure for Identification of Bacterial Metabolic Products,
W73-10502 5A

Halogenated Compounds for the Sensitive Detection of Clostridia by Gas Chromatography,
W73-10550 5A

Chlorinated Hydrocarbon Pesticides and Related Compounds in Adipose Tissue from People of Japan,
W73-10854 5A

Differentiation of Some Enterococci by Gas Chromatography,
W73-11027 5A

On-The-Fly Gas Chromatography-Infrared Spectrometry Using A Cholesteric Liquid Crystal-Effluent Interface,
W73-11034 5A

Gas Chromatographic Separation, by Carbon Number and Hydrocarbon Type, of Saturated Hydrocarbon Mixtures and Different Naphthas Over Molecular Sieves 13X,
W73-11035 5A

Selective Determination of Hetero-Organics by a Dual-Channel Detector Based on Flame Conductivity and Emission,
W73-11040 5A

Identification of Heavier Aromatic Components in Reformed Petroleum Products by Direct Coupled Capillary Gas Chromatography-Mass Spectrometry,
W73-11044 5A

GAS LIQUID CHROMATOGRAPHY
Persistence of Parathion in Six California Soils Under Laboratory Conditions,
W73-10476 5B

Studies of the Cell Envelope of Vibrio Parahaemolyticus,
W73-10501 5A

Dynamics of a Salt of (2,4-Dichlorophenoxy) Acetic Acid in Fish, Water, and Hydrosol,
W73-10507 5C

Gas Chromatography of Organonitrogen Pesticides, Using a Nitrogen-Specific Detection System,
W73-10548 5A

The Use of Gas-Liquid Chromatography for Selecting Extractive Solvents for Liquid Extraction Processes,
W73-11036 5A

GAS-LIQUID-SOLID CHROMATOGRAPHY
Gas-Liquid-Solid Chromatography of Free Acids,
W73-10473 5A

GAS SOLID CHROMATOGRAPHY
Gas Chromatographic Separation, by Carbon Number and Hydrocarbon Type, of Saturated Hydrocarbon Mixtures and Different Naphthas Over Molecular Sieves 13X,
W73-11035 5A

GASES
Method for Exposing Bacterial Cultures on Solid Media to a Defined Gas Mixture Using Nylon Bags,
W73-11049 5A

GC-INFRARED SPECTROMETRY
On-The-Fly Gas Chromatography-Infrared Spectrometry Using A Cholesteric Liquid Crystal-Effluent Interface,
W73-11034 5A

GC-MASS SPECTROMETRY
Separation and Characterization of Dimethylnitrobiphenyl and Dimethylbiphenylamine Isomers by Chromatographic and Spectrometric Methods,
W73-11032 5A

Identification of Heavier Aromatic Components in Reformed Petroleum Products by Direct Coupled Capillary Gas Chromatography-Mass Spectrometry,
W73-11044 5A

GELS
Investigation of use of Gel Material for Mine Sealing,
W73-10880 5G

GENETICS
The Genetics of Blue-Green Algae,
W73-10938 5C

GEOFUNGI
Slime-Inhabiting Geofungi in a Polluted Stream (Winter/Spring),
W73-10859 5C

GEOLOGIC INVESTIGATIONS
Side-Look Radar Provides a New Tool for Topographic and Geological Surveys,
W73-10615 7B

Well Logs: A Basic Drilling Tool--6. Use Diagenesis to Spot Formation Characteristics,
W73-10716 8G

Seismograph and Resistivity Use in Shallow Groundwater Search,
W73-10793 8G

GEOLOGICAL SURVEYS
Side-Look Radar Provides a New Tool for Topographic and Geological Surveys,
W73-10615 7B

GEOMORPHOLOGY
Geomorphology and Hydrology of Karst Drainage Basins and Cave Channel Networks in East Central New York,
W73-10665 2F

Holocene Evolution of the Shelf Surface, Central and Southern Atlantic Shelf of North America,
W73-10769 2J

GEORGIA
Microbial Changes and Possible Ground Water Pollution from Poultry Manure and Beef Cattle Feedlots in Georgia,
W73-10403 5B

Some Ecological Aspects of a Nesting Colony of Herons,
W73-10651 2H

Water Circulation and Sedimentation at Estuary Entrances on the Georgia Coast,
W73-10766 2J

Groundwater Wells Serve Mining Industry,
W73-10799 8A

A Preliminary Investigation of Organic-Inorganic Associations in a Stagnating System,
W73-11004 5B

GEOSTROPHIC DRAG
Computing Evapotranspiration by Geostrophic Drag Concept,
W73-10970 2D

GEOSTROPHIC WIND
Computing Evapotranspiration by Geostrophic Drag Concept,
W73-10970 2D

GEOTHERMAL GRADIENT
Heat Flow and Precision Temperature Measurements in Boreholes,
W73-10786 8G

GEOTHERMAL STUDIES
Assessment of Geothermal Energy Resources.
W73-10696 6B

GEOTROPIC GROWTH
On the Geotropic Growth of the Root, (In German),
W73-10632 2I

GERMANY (OERTZE LOWLAND)
Breeding Places of Mosquitoes in the Area of the Oertze Lowland (Luenburger Heide): 1. Breeding Places of Aedes Punctor Kirby,
W73-10648 2I

GLACIATION
Dating Cave Calcite Deposits by the Uranium Disequilibrium Method: Some Preliminary Results from Crowsnest Pass, Alberta,
W73-10978 2J

GLACIERS
Ablation on Glaciers in Soviet Central Asia (Ablyatsiya lednikov Sredney Azii),
W73-10778 2C

GLASS SHRIMP
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

GOLDEN SHINER
A Study of the Influence of Calcium on the Effects of DDT on Fishes,
W73-10537 5C

GOLDFISH
A Study of the Influence of Calcium on the Effects of DDT on Fishes,
W73-10537 5C

GOLENKINIA MINUTISSIMA
The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

GOLODNAYA STEPPE
Water Balance and Runoff Losses in the Fergana Valley and Golodnaya Steppe (Struktura vodnogo balansa i poteri rechnogo stoka v Ferganskoy doline i Golodnoy stepi),
W73-10456 2A

GOVERNMENTAL INTERREALTIONS
Federal Interaction with States,
W73-10572 5G

GOVERNMENTS
The Potential of Regional Organizations in Managing Man's Environment,
W73-10569 5G

GRAND CANYON NATIONAL PARK AND MONUMENT
An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

GRAPE CULTIVEN
Analysis of Water Consumption of Various Grape Cultivars,
W73-10440 2D

GRASSES
Converting Chaparral to Grass to Increase Streamflow,
W73-10831 3B

Effect of a Grass and Soil Filter on Tucson Urban Runoff: A Preliminary Evaluation,
W73-10835 5D

GRAVELS
The Significance of Wave Parameters In the Sorting of Beach Pebbles,
W73-10431 2J

Seismograph and Resistivity Use in Shallow Groundwater Search,
W73-10793 8G

GRAVITY WAVES
Experiments on Bottom Sediment Movement by Breaking Internal Waves,
W73-10750 2J

GRAZING
Enhancement of Net Primary Productivity by Herbivore Grazing in Aquatic Laboratory Microcosms,
W73-10460 5C

GREAT BRITAIN
Pollution in Some British Estuaries and Coastal Waters.
W73-10554 5B

GREAT LAKES
Biological Nitrogen Fixation in the Great Lakes,
W73-10511 5C

GREAT MARSH (DEL)
Trace Metals in Cores from the Great Marsh, Lewes, Delaware.
W73-10971 2J

GREAT PLAINS
Salinity Problems of Impoundments and Their Management,
W73-10734 5G

GROUND WATER MOVEMENT
Effect of a Water Table Aquitard on Drawdown in an Underlying Pumped Aquifer,
W73-10968 4B

GROUNDWATER
Geohydrologic Reconnaissance and Study Plan for Water Resources Investigations in the Baroda-Broach Area, Gujarat, India,
W73-10439 4A

Role of Connecticut River Flood Flows in Recharging Ground-Water Formations,
W73-10733 4B

Hydrogeology and Engineering Geology (Gidrogeologiya i inzhenernaya geologiya).
W73-10777 2F

'Iron Water' from Wells: Causes and Prevention,
W73-10785 4B

A Contribution to the Knowledge of Physical and Chemical Properties of the Ground Waters in the Slovene Karst,
W73-10801 2F

Groundwater Contamination in the Cortaro Area, Pima County, Arizona,
W73-10826 5B

Water-Temperature Data Acquisition Activities in the United States,
W73-10986 7C

The Application of Flameless Atomic Absorption in Hydrogenochemical Analysis,
W73-11039 2K

GROUNDWATER AVAILABILITY
Notes on Developing Ground Waters,
W73-10711 4B

GROUNDWATER AVAILABILITY

Well Drilling in Southeast Asia,
W73-10795 8A

Drilling for Water in New England,
W73-10796 8A

GROUNDWATER BASINS
Simulation of Hydrochemical Patterns in Regional Groundwater Flow,
W73-10664 2K

Transmissivity Distribution in the Tucson Basin Aquifer,
W73-10827 2F

GROUNDWATER DEPLETION
An Economic Model of an Area's Response to Depletion of its Water Resources,
W73-10405 4B

GROUNDWATER MINING
The Groundwater Supply of Little Chino Valley,
W73-10824 2F

Subsidence Damage in Southern Arizona,
W73-10825 2F

Collective Utility of Exchanging Treated Sewage Effluent for Irrigation and Mining Water,
W73-10834 3C

GROUNDWATER MOVEMENT
Behavior of Groundwater Flow Subject to Time-Varying Recharge,
W73-10662 2F

Hydrologic Studies Using the Boussinesq Equation with a Recharge Term,
W73-10671 2F

Nonlinear Equation of Unsteady Groundwater Flow,
W73-10965 2F

Friction Factor and Reynolds Number in Porous Media Flow,
W73-10991 2F

GROUNDWATER RECHARGE
Notes on Developing Ground Waters,
W73-10711 4B

Role of Connecticut River Flood Flows in Recharging Ground-Water Formations,
W73-10733 4B

The Groundwater Supply of Little Chino Valley,
W73-10824 2F

Water Disposition in Ephemeral Stream Channels,
W73-10846 2E

GROUNDWATER RESOURCES
Groundwater Resources of Coke County, Texas,
W73-10744 4B

The Groundwater Supply of Little Chino Valley,
W73-10824 2F

GROWTH
The Effects of Humic Acid on the Growth and Digestibility in Fish Fed Brown Fish Meal and Soybean Meal Diets, (In Japanese),
W73-10804 2I

GROWTH RATES
The Validity of the Application of Simple Kinetic Analysis to Heterogeneous Microbial Populations,
W73-10489 5C

Growth and Metabolism of Ostrea edulis Larvae,
W73-10847 5C

GULF COASTS
Beneficial Aquatic Plants in Coastal Areas,
W73-10955 3B

GULF OF MEXICO
The Gulf Environmental Program,
W73-10575 5G

GULLS
Salmonellae and Edwardsiella Tarda in Gull Feces: A Source of Contamination in Fish Processing Plants,
W73-10463 5B

HALLOYSITE
Chemical Interactions of Aluminum with Aqueous Silica at 25 degrees C,
W73-10433 2K

HALOGENATED HYDROCARBONS
Halogenated Hydrocarbons in and Over the Atlantic,
W73-10873 5B

HALOGENS
Apparatus for Monitoring and Controlling Halogen Levels in a Water Treatment System,
W73-10593 5F

HARBOR IMPROVEMENT
Computer Simulation of Recreational Boating Activities,
W73-10623 6A

HARBORS
The Evolution of Lewes Harbor,
W73-10438 2J

The State of Marine Pollution in the Mediterranean and Legislative Controls.
W73-10553 5B

Report of Study on Ships Channels and Harbors,
W73-10576 5G

HARVESTING
Current Investigations in the Jacksonville District Concerning Mechanical Harvesting of Obnoxious Aquatic Plants,
W73-10953 4A

Mechanical Harvesting of Water Hyacinth in Shell Creek Reservoir, Charlotte County, Florida,
W73-10962 3B

HEAD LOSS
Dividing Flow in Closed Conduits,
W73-10608 8B

HEAT EXCHANGE
Desalination Plant,
W73-10589 3A

HEAT EXCHANGERS
Multiple Expansion Flash Evaporator Comprising A Continuous Casing With A Central Evaporation Chamber,
W73-10601 3A

HEAT FLOW
Heat Flow and Precision Temperature Measurements in Boreholes,
W73-10786 8G

HEATED GRAPHITE ATOMIZER
The Direct Determination of Chromium in Urine by Selective Volatilization with Atom Reservoir Atomic Absorption,
W73-10525 5A

The Application of Flameless Atomic Absorption in Hydrogenochemical Analysis,
W73-11039 2K

HEATED GRAPHITE FURNACE
The Atomic Absorption Determination of Zinc with a Graphite Furnace,
W73-10515 5A

HEATING
A Search: New Technology for Pavement Snow and Ice Control,
W73-10883 5G

HEAVY METALS
Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

Marina Del Rey: A Study of Environmental Variables in a Semi-Enclosed Coastal Water,
W73-10465 5B

Preliminary Analyses of Urban Wastes, New York Metropolitan Region,
W73-10471 5A

Studies in the Complex Formation of Metal Ions with Sugars. Part I. The Complex Formation of Cobalt (II), Cobalt (III), Copper (II) and Nickel (II) with Mannitol,
W73-10524 5B

Heavy Metals in Estuaries and the Coastal Zone,
W73-10555 5B

Heavy Metals in British Waters,
W73-10851 5B

Separation and Preconcentration,
W73-10861 5A

The Distribution of Heavy Metals in Sediments of Sorfjord, West Norway,
W73-10865 5B

A Preliminary Investigation of Organic-Inorganic Associations in a Stagnating System,
W73-11004 5B

Trace Element Determination with Semiconductor Detector X-Ray Spectrometers,
W73-11031 5A

The Application of Flameless Atomic Absorption in Hydrogenochemical Analysis,
W73-11039 2K

X-Ray Microdetermination of Chromium, Cobalt, Copper, Mercury, Nickel, and Zinc in Water Using Electrochemical Preconcentraton,
W73-11043 5A

HELISOMA CAMPANULATA
Uptake and Biotransformation of Phenylmercuric Acetate by Aquatic Organisms,
W73-10477 5B

HELMINTHS
Climate and Development of Helminths: I. Climatology and Helminth Development, (In French),
W73-10630 2I

HERBICIDES
Direct Titrimetric Microdetermination of Fluorodifen, Linuron, Faneron, and Pebulate,
W73-10481 5A

Control of Algae,
W73-10945 5C

HERONS
Some Ecological Aspects of a Nesting Colony of Herons,
W73-10651 2H

HIGH SPEED LIQUID CHROMATOGRAPHY
Larger Diameter Columns for Modern, High Speed Liquid Chromatography,
W73-10539 2K

Method for High-Speed Liquid Chromatographic Analysis of Benomyl and/or Metabolite Residues in Cow Milk, Urine, Feces, and Tissues,
W73-10547 5A

HIGHWAY BRIDGES
The San Fernando Earthquake: A Lesson In Highway and Bridge Design,
W73-10612 8A

HIGHWAY ICING
Underground Corrosion and Salt Infiltration,
W73-10712 4C

A Search: New Technology for Pavement Snow and Ice Control,
W73-10883 5G

HORIZONTAL WELLS
Notes on Developing Ground Waters,

KARST
Geomorphology and Hydrology of Karst Drainage Basins and Cave Channel Networks in East Central New York,
W73-10665 2F

Dating Cave Calcite Deposits by the Uranium Disequilibrium Method: Some Preliminary Results from Crowsnest Pass, Alberta,
W73-10978 2J

KARST HYDROLOGY
Geohydrologic Study of the Gort Lowland and Adjacent Areas of Western Ireland Using Environmental Isotopes,
W73-10660 2F

Mass Balance and Spectral Analysis Applied to Karst Hydrologic Networks,
W73-10661 2F

Geomorphology and Hydrology of Karst Drainage Basins and Cave Channel Networks in East Central New York,
W73-10665 2F

KELPS
Production of the Giant Kelp, Macrocystis, Estimated by In Situ Incorporation of C-14 in Polyenthylene Bags,
W73-10516 5B

KERATIN
Removal of Mercury From Liquids Using Keratin Derivatives,
W73-10587 5D

KERCH STRAIT
Exchange of Nutrients Salts Through the Kerch Strait (Obmen pitatel'nymi solyami cherez Kerchenskiy Proliv),
W73-10781 2K

KEROSENE
Effect of Seawater Soluble Fraction of Kerosene on Chemotaxis in a Marine Snail, Nassarius Obsoletus,
W73-10872 5C

KEYSTONE LAKE (OKLA)
Chemical Equilibrium Models of Lake Keystone, Okla.,
W73-10480 5B

KHARKOV BASIN
The Discovery of Bothriocephalus gowkongensis Yeh. In the Basin of Kharkov Region, (In Russian),
W73-10631 8I

KIEV RESERVOIR (USSR)
Productivity of Aquatic Organism Communities of Different Trophic Levels in Kiev Reservoir,
W73-10911 5C

KURAKHOV POWER STATION (USSR)
Biological Productivity of Kurakhov's Power Station Cooling Reservoir,
W73-10913 5C

LABORATORY EQUIPMENT
Two Instruments for Activation Analysis of Solutions by a Dilution Method,
W73-10509 7B

The Determination of Total Nitrogen in Plant Materials with an Automatic Nitrogen Analyser,
W73-10530 5A

Larger Diameter Columns for Modern, High Speed Liquid Chromatography,
W73-10539 2K

Agar-Plug Cutter and Inoculation Device,
W73-10858 5A

Fast Liquid Chromatography,
W73-11022 5A

LAGO POND (GEO)
A Preliminary Investigation of Organic-Inorganic Associations in a Stagnating System,
W73-11004 5B

LAGOONS
Experimental Treatment of Surface Water Purification by Lagoons: Chemical and Microbiological Aspects, (Traitement Experimental d'Epuration d'Une eau de Surface Par Lanunage: Aspects Chimiques et Microbiologiques),
W73-11000 5B

LAKE BAIKAL (USSR)
Biological Productivity and Balance of Organic Substance and Energy in Lake Baikal,
W73-10900 5C

LAKE CHILWA (MALAWI)
Some Characteristics of a Shallow Endorheic Lake in its Drying Phase and its Revovery Phase. Lake Chilwa (Malawi),
W73-10932 5C

LAKE DALNEE (KAMCHATKA)
The Modelling of the Ecosystem of Lake Dalnee on an Electronic Computer,
W73-10899 5C

LAKE ERIE
Mercury Pollution and Lake Erie Fishes,
W73-10444 5A

LAKE GEORGE (UGANDA)
Lake George, Uganda. Studies on a Tropical Freshwater Ecosystem.
W73-10905 5C

The Regulation of Net Primary Production in Lake George, Uganda, East Africa,
W73-10926 5C

LAKE KRIVOE (KARELIA)
Biological Productivity of Lakes Krivoe and Krugloe,
W73-10896 5C

LAKE KRUGLOE (KARELIA)
Biological Productivity of Lakes Krivoe and Krugloe,
W73-10896 5C

LAKE MAGGIORE (ITALY)
Comparative Trends of Primary Productivity and Some Chemical Parameters in Lake Maggiore on a Pluriannual Basis,
W73-10927 5C

LAKE MICHIGAN
Computer Simulation of Recreational Boating Activities,
W73-10623 6A

Precise Water Velocity Measurements Using Photogrammetric Techniques,
W73-10678 5B

LAKE MORPHOLOGY
Water Resources of Mountain Lakes in Soviet Central Asia (Vodnyye resursy gornykh ozer Sredney Azii),
W73-10450 2H

An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

LAKE MORPHOMETRY
Water Resources of Mountain Lakes in Soviet Central Asia (Vodnyye resursy gornykh ozer Sredney Azii),
W73-10450 2H

LAKE NASSER (EGYPT)
Comparison of the Physical and Chemcial Environments of Volta Lake and Lake Nasser,
W73-10931 5C

LAKE OVRE HEIMDALSVATN
The Phytoplankton of Lake Ovre Heimdalsvatn, Central South Norway, 1969-70,
W73-10644 5C

LAKE RESTORATION
Correlated Studies of Vancouver Lake-Hydraulic Model Study,
W73-10881 5B

Correlated Studies of Vancouver Lake - Water Quality Prediction Study,
W73-10882 5B

The Bottom Fauna in an Oil-Contaminated Lake,
W73-10934 5C

Ecosystem Studies in Connection with the Restoration of Lakes,
W73-10935 5C

'Bringing Sick Lakes Back to Health',
W73-10947 5C

LAKE SEDIMENTS
Diatoms in Alkaline, Saline Lakes: Ecology and Geochemical Implications,
W73-10545 5C

Pesticide-Sediment-Water Interactions,
W73-10892 5B

LAKE TATSU-NUMA (JAPAN)
Trophic Structure of Lake Tatsu-Numa, An Acidotrophic Lake in Japan, With Special Reference to the Importance of the Terrestrial Community,
W73-10910 5C

LAKES
Water Resources of Mountain Lakes in Soviet Central Asia (Vodnyye resursy gornykh ozer Sredney Azii),
W73-10450 2H

Data on Selected Lakes in Washington, Part I,
W73-10654 2H

An Evaluation of Current Practices in Seepage Control,
W73-10828 4A

The Production Processes in Two High-Mountain Lakes (Vor-Derer and Hinterer Finstertaler See, Kuhtai, Austria),
W73-10902 5C

The Char Lake Project. A Study of Energy Flow in a High Arctic Lake,
W73-10904 5C

Functions and Interactions of Dissolved Organic Matter and the Littoral Zone in Lake Metabolism and Eutrophication,
W73-10906 5C

Some Interim Results of Soviet IBP Investigations on Lakes,
W73-10908 5C

Biological Productivity of Different Types of Lakes,
W73-10909 5C

Comparison of the Physical and Chemcial Environments of Volta Lake and Lake Nasser,
W73-10931 5C

Some Characteristics of a Shallow Endorheic Lake in its Drying Phase and its Revovery Phase. Lake Chilwa (Malawi),
W73-10932 5C

The Bottom Fauna in an Oil-Contaminated Lake,
W73-10934 5C

Ecosystem Studies in Connection with the Restoration of Lakes,
W73-10935 5C

Effect of Bottom Topography, Eddy Diffusivity, and Wind Variation on Circulation in a Two-Layer Stratified Lake,
W73-10973 2H

LAMINAR FLOW
Nonlinear Stability of Plane Poiseuille Flow of Viscoelastic Liquids,
W73-10428 2E

LAND DEVELOPMENT
Effects of Urbanization of Sedimentation and Floodflows in Colma Creek Basin, California,
W73-10653 4C

LAND MANAGEMENT
International Co-operation for Pollution Control,
W73-10566 5G

LAND SUBSIDENCE
Mathematical Simulation of the Subsidence of Venice: 1. Theory,
W73-10663 2F

LAND USE
W.A.L.R.U.S. I Water and Land Resource Utilization Simulation,
W73-10735 6A

A Comparative Study of Resource Analysis Methods,
W73-10737 6A

LARVAE
A Quantitative Push-Net System for Transect Studies of Larval Fish and Macrozooplankton,
W73-10485 7B

Growth and Metabolism of Ostrea edulis Larvae,
W73-10847 5C

LARVAL GROWTH
Nature of Larval and Juvenile Growth of Some Freshwater Fish at Different States of Development, (in Russian),
W73-10468 2I

LAS VEGAS (NEV.)
Influence of Surface and Near-Surface Caliche Distribution on Infiltration Characteristics and Flooding, Las Vegas Area, Nevada,
W73-10721 2E

LAUNDERING
Influence of Water Quality in Maintaining Whiteness When Laundering White Fabrics,
W73-10420 5G

LEACHING
Effect of Depth and Quality of Ground Water on Soil Salinization: A Field Study with a Fluctuating Water Table,
W73-10441 2G

Chloride Balance of Some Farmed and Forested Catchments in Southwestern Australia,
W73-10669 2K

Groundwater Wells Serve Mining Industry,
W73-10799 8A

LEAD
Lead Outputs in Streamflow from a Watershed Ecosystem,
W73-10673 5B

Some Trace Element Concentration Variations Observed in Marine Organisms that Suggest Caution in Sampling,
W73-11021 5A

The Determination of Trace Metals and Their Significance in Clinical Chemistry,
W73-11030 5A

LEAF DIFFUSION
Leaf Diffusion Resistance to Water Vapour and its Direct Measurement: I. Introduction and Review Concerning Relevant Factors and Methods,
W73-10703 7B

LEBISTES RETICULATUS
Uptake and Biotransformation of Phenylmercuric Acetate by Aquatic Organisms,
W73-10477 5B

LEGAL ASPECTS
Some Legal Problems of Urban Runoff,
W73-10830 6E

LEGISLATION
California's Marine Program,
W73-10577 5G

Pollution of the Marine Environment and the Effects Therefrom: The Case for Stricter Enforcement,
W73-10581 5C

LEWES HARBOR (DEL)
The Evolution of Lewes Harbor,
W73-10438 2J

LIABILITY
International Co-operation for Pollution Control,
W73-10566 5G

LICENSING
International Co-operation for Pollution Control,
W73-10566 5G

LIFE HISTORY STUDIES
The Effects of Pollution on Gammarus Pulex (L) Subsp, Pulex (Schellenberg) in the Inlet Streams of Rostherne Mere, Cheshire,
W73-11047 5C

LIGHT INTENSITY
Diurnal Periodicity in the Phytoplankton Assemblage of a High Mountain Lake,
W73-10461 5C

LIGHT PENETRATION
Observations on the Transparency of the Waters of the Pulicat Lake with Particular Reference to Plankton Production,
W73-11046 5C

LIMITING FACTORS
An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

LIMNOLOGY
Data on Selected Lakes in Washington, Part I,
W73-10654 2H

The Uniqueness of Salt Lake Ecosystems,
W73-10907 5C

LINEAR PROGRAMMING
Values and Cost Allocations of Surface-Water Use and Treatment,
W73-10558 6B

The Development of A Plan of Study--An Interagency Approach to Multiobjective Planning and Evaluation of Water and Land Resource Use,
W73-10622 6A

A Budgeting and Linear Programming Analysis of Irrigation Water Values in Northern Wyoming,
W73-10699 3F

LINURON
Direct Titrimetric Microdetermination of Fluorodifen, Linuron, Faneron, and Pebulate,
W73-10481 5A

LITTORAL
Production and Decomposition in the Eulittoral Zone of Lakes,
W73-10903 5C

Functions and Interactions of Dissolved Organic Matter and the Littoral Zone in Lake Metabolism and Eutrophication,
W73-10906 5C

LITTORAL DRIFT
The Significance of Wave Parameters In the Sorting of Beach Pebbles,
W73-10431 2J

LIVER
Detection of Organo-Phosphorus Pesticide Residues in Autopsy Tissues by Thin-Layer Chromatography,
W73-11023 5A

LOAM SOILS
Overhead Irrigation of Sugar Beet on Silty Loam: The Effect of Sprinkling and N-Manuring on Yields and Essential Quality Factors, (In German),
W73-10810 3F

LOCAL GOVERNMENTS
Proceedings of the 1971 OSTAC Annual Meeting, State Department, Washington, D.C. 2-3 June 1971.
W73-10570 5G

LOCH LEVEN (SCOTLAND)
Phytoplankton Production, Chemical and Physical Conditions in Loch Leven,
W73-10922 5C

LOESS SOILS
Determination of Evaporation of Water from Arid Loess Soils During Nightly Temperature Inversion Phase by Tritium-Labeling of Predetermined Soil Layers,
W73-10802 2D

LOGGING (RECORDING)
New Acoustic Tool Logs Cased Holes,
W73-10705 8A

Well Logs: A Basic Drilling Tool--6. Use Diagenesis to Spot Formation Characteristics,
W73-10716 8G

LONG ISLAND
Long Island's Approach to Environmental Quality,
W73-10573 5G

LONG ISLAND SOUND
Organic Mercury Compounds in Coastal Waters,
W73-10855 5A

LOUISIANA
Mechanical Equipment Used for Aquatic Plant Control in Louisiana,
W73-10952 4A

Aquatic Plant Problems in Louisiana,
W73-10961 3B

An Analysis of Stream Temperatures in Louisiana,
W73-10987 2G

LUMBERING
The Influence of Benthic Bark Deposits on Aquatic Community and the Quality of Natural Waters,
W73-10411 4C

MACROCYSTIS PYRIFERA
Production of the Giant Kelp, Macrocystis, Estimated by In Situ Incorporation of C-14 in Polyenthylene Bags,
W73-10516 5B

MACROINVERTEBRATES
A Quantitative Push-Net System for Transect Studies of Larval Fish and Macrozooplankton,
W73-10485 7B

Distribution of Vibrio Parahaemolyticus in the Natural Environment,
W73-10875 5B

The Effects of Pollution on Gammarus Pulex (L) Subsp, Pulex (Schellenberg) in the Inlet Streams of Rostherne Mere, Cheshire,
W73-11047 5C

MAINE
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Report of Study on Ships Channels and Harbors,
W73-10576 5G

MAINTENANCE
Well Operation,
W73-10714 8A

The Health and Care of Wells,
W73-10794 8B

MAIZE
Agrometeorological Indicators of the Maize Development in the Reproduction Period, (In Bulgarian),
W73-10635 3F

Survival of Maize Bacterial Stalk Rot Pathogens in Infected Tissue Under Different Moisture and Temperature Conditions,
W73-10800 3F

MALACCA (MALAYSIA)
Some Observations on Primary and Fish Production in Experimental Fish Ponds in Malacca, Malaysia,
W73-10918 5C

MALI
Rice Growing in Deep Water in Mali,
W73-10628 3F

MANAGEMENT
International Environmental Controls in the Scientific Age,
W73-10567 5G

Department of Interior Program,
W73-10571 5G

Federal Interaction with States,
W73-10572 5G

Long Island's Approach to Environmental Quality,
W73-10573 5G

California's Marine Program,
W73-10577 5G

Ocean Utilization and Coastal Zone Development.

The Determination of Manganese in Urine by Atomic Absorption Spectrometry,
W73-10528 5A

Studies in Chemical Ionization Mass Spectrometry,
W73-10541 5A

Gas Chromatography of Organonitrogen Pesticides, Using a Nitrogen-Specific Detection System,
W73-10548 5A

New Methods for the Determination of Elements in Trace Amounts,
W73-10862 5A

Base for a Model of the Slapy Reservoir Ecosystem,
W73-10916 5C

Comparison of Flame and Flameless Atomic Absorption for the Determination of Calcium,
W73-11037 2K

MICHIGAN
Spectrographic Analysis of Metals in Freshwater Sediments,
W73-10407 5A

Influence of Na3NTA and Na4 EDTA upon the Activation of Metals in River and Lake Sediments in Michigan,
W73-10408 5B

Application of Selected Industrial Engineering Techniques to Waste Water Treatment Plants,
W73-10723 5D

An Investigation of the Sesmic Wave Propagation Properties of a Thin Unsaturated Layer as a Wave Guide,
W73-10888 4B

Reconnaissance of the Manistee River, A Coldwater River in the Northwestern Part of Michigan's Southern Peninsula,
W73-10985 7C

MICROBIAL DEGRADATION
Microbial Changes and Possible Ground Water Pollution from Poultry Manure and Beef Cattle Feedlots in Georgia,
W73-10403 5B

Persistence of Parathion in Six California Soils Under Laboratory Conditions,
W73-10476 5B

Distribution Pattern of Phytoplankton and Bacteria, Microbial Decomposition of Organic Matter and Bacterial Production in Eutrophic, Stratified Lake,
W73-10901 5C

Microbial Decomposition of Pentachlorophenol,
W73-11048 5B

MICROCALORIMETRY
Bacterial Identification by Microcalorimetry,
W73-10848 5A

MICROWAVE RADIOMETERS
Multi-Sensor Detection and Tracking of Controlled Oil Spills,
W73-10467 5B

MIDGES
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

MIGRATION
Diurnal Vertical Migration of an Estuarine Cladoceran, Podon Polyphemoides, in the Chesapeake Bay,
W73-10941 2L

MIGRATION PATTERNS
Diurnal Periodicity in the Phytoplankton Assemblage of a High Mountain Lake,
W73-10461 5C

MIGRATION (SPAWNING)
Migration of Sturgeon (Acipenseridae) in the Volga During Winter, (In Russian),
W73-10614 2I

MINE ACIDS
Geohydrology,
W73-10790 4B

MINE DRAINAGE
Establishing Priorities in Mine Drainage Reduction, A Cost-Effectiveness Approach,
W73-10624 5G

Dewatering of Mine Drainage Sludge -Phase II,
W73-10724 5D

Investigation of use of Gel Material for Mine Sealing,
W73-10880 5G

MINE SEALING
Investigation of use of Gel Material for Mine Sealing,
W73-10880 5G

MINERAL INDUSTRY
Geohydrology,
W73-10790 4B

Groundwater Wells Serve Mining Industry,
W73-10799 8A

MINERALOGY
Mineralogy of Suspended Sediment off the Southeastern United States,
W73-10759 2J

MINICOMPUTERS
Through the Mini Maze,
W73-11015 7C

MINNESOTA
Freshwater Algae From the Itasca State Park Minnesota, IV. Cyanophta, Rhodophyta, Chloromonadophyceae, and Cryptophyceae,
W73-10544 5A

Water Quality Management Plan, Interim St. Croix River Basin.
W73-10689 5G

MISSING DATA
A Test of Equality of Means of Correlated Variates With Missing Data on One Response,
W73-11013 7C

MISSISSIPPI DELTA
Observations on Wind, Tidal, and Density-Driven Currents in the Vicinity of the Mississippi River Delta,
W73-10752 2J

MISSISSIPPI RIVER
Observations on Wind, Tidal, and Density-Driven Currents in the Vicinity of the Mississippi River Delta,
W73-10752 2J

MIXING
Precise Water Velocity Measurements Using Photogrammetric Techniques,
W73-10678 5B

Effective Mixing in Shallow Bodies of Water with and without Density Stratification,
W73-10719 5D

MIXTURES
Method for Exposing Bacterial Cultures on Solid Media to a Defined Gas Mixture Using Nylon Bags,
W73-11049 5A

MODEL ORDINANCE
Model Flood Plain Zoning Ordinance,
W73-10691 6F

MODEL STUDIES
Oxygen-Carbon Dioxide-Nutrients Relationships in the Northeastern Pacific Ocean and Southeastern Bering Sea,
W73-10532 5B

Processes Affecting the Oceanic Distribution of Carbon Dioxide,
W73-10534 5B

The Construction of a Probability Distribution for Rainfall on a Watershed by Simulation,
W73-10842 2B

A Proposed Model for Flood Routing in Abstracting Ephemeral Channels,
W73-10844 2E

The Modelling of the Ecosystem of Lake Dalnee on an Electronic Computer,
W73-10899 5C

MOISTURE POTENTIAL
Filters With a Constant Moisture Potential at the Surface (Fil'try s postoyannym potentsialom vlagi na poverkhnosti),
W73-10774 2G

MOLECULAR STRUCTURE
Gas-Liquid-Solid Chromatography of Free Acids,
W73-10473 5A

Gas Chromatographic Separation, by Carbon Number and Hydrocarbon Type, of Saturated Hydrocarbon Mixtures and Different Naphthas Over Molecular Sieves 13X,
W73-11035 5A

MOLECULAR WEIGHT FRACTIONATION
A Preliminary Investigation of Organic-Inorganic Associations in a Stagnating System,
W73-11004 5B

MOLYBDENUM BLUE METHOD
A Biological Evaluation of the Molybdenum Blue Method for Orthophosphate Analysis,
W73-10943 5A

MONITORING
Development of an Oil/Water Pollution Monitor,
W73-10491 5A

Simultaneous Quantitation of Salmonella Species and Pseudomonas Aeruginosa. I. Polluted Waters. II. Persistence of Pathogens in Sludge Treated Soils. III. Analysis of Waste Treatment Sludges for Salmonella Species as a Surveillance Tool,
W73-10549 5B

A Network for Continuous Monitoring of Water Quality in the Sabine River Basin, Texas and Louisiana,
W73-10683 5A

Through the Mini Maze,
W73-11015 7C

Detectors for Measurement of Water Pollution.
W73-11016 5A

MONTANE RIVER
Primary Production of a Montane River,
W73-10923 5C

MONTEREY BAY (CALIF)
On the Storage of Seawater Samples for Ammonia Determination,
W73-10518 5A

MONTHLY
Computation of Monthly Solid Precipitation from Total Monthly Precipitation and Average Monthly Air Temperature (Raschet mesyachnykh summ tverdykh osadkov po obshchim mesyachnym summam osadkov i srednim mesyachnym znacheniyam temperat ury vozdukha),
W73-10452 2C

Objective and Subjective Analysis of Transition Probabilities of Monthly Flow on an Ephemeral Stream,
W73-10843 2E

MOSQUITO CONTROL
Effects of Mosquito Control Ditching on Estuarine Ecosystems,
W73-10410 5G

MOSQUITOES
Insect-Production of Blood-Sucking Mosquitoes Culex Pipiens L. and Allotheobaldia Longiareolata Macq. in Shower Installations Under Conditions of a Hot Climate, (In Russian),
W73-10647 2I

Breeding Places of Mosquitoes in the Area of the Oertze Lowland (Luenburger Heide): 1. Breeding Places of Aedes Punctor Kirby,
W73-10648 2I

MOSSES
Desiccation Injury in Mosses: II. The Effect of Moisture Stress on Enzyme Levels,
W73-10522 2I

MOUNTAIN LAKE (MASS)
The Origin, Effects and Control of Turbidity in an Urban Recreational Lake,
W73-10406 5B

MOUNTAIN LAKES
A High-Mountain Lake (Vorderer Finstertaler See, Kuehtai, Austria) As a Model of Energy Flow Through A Freshwater Ecosystem, (In German),
W73-10870 2H

MOUNTAINS
Some Results and Ways of Developing Methods of Streamflow Measurement in Mountain Countries (Nekotoryye itogi i puti razvitiya sposobov rascheta stoka v usloviyakh gornykh stran),
W73-10449 7B

Water Resources of Mountain Lakes in Soviet Central Asia (Vodnyye resursy gornykh ozer Sredney Azii),
W73-10450 2H

Effects of Orography on Distribution of Precipitation in Mountain Basins (Vliyaniye nekotorykh elementov orografii na raspredeleniye osadkov v gornykh basseynakh),
W73-10451 2B

Primary Production of a Montane River,
W73-10923 5C

MOZHAISKII RESERVOIR
Food Supply of Roach Underyearlings Rutilus rutilus (L.) in the Mozhaiskii Reservoir (In Russian),
W73-10458 2H

MS-222
Residues of MS-222 in Northern Pike, Muskellunge, and Walleye,
W73-10496 5A

MUD
A Two-Layer Model of Mud Transport in the Thames Estuary,
W73-10443 2L

Transport and Escape of Fine-Grained Sediment from Shelf Areas,
W73-10756 2J

MUD (FLOATING)
Study on the Acoustic Characteristics of Under-Water: Floating Mud-I, (In Japanese),
W73-10803 5B

MULTIDISCIPLINARY APPROACH
The Development of A Plan of Study--An Interagency Approach to Multiobjective Planning and Evaluation of Water and Land Resource Use,
W73-10622 6A

MULTIELEMENTAL ANALYSIS
Trace Element Analysis by Proton-Induced X-Ray Excitation,
W73-10508 5A

MULTIPLE-PURPOSE PROJECTS
Methodological Improvements in Measuring Economic Effects of Multipurpose Water Resource Projects.
W73-10417 6B

Ecological Significance of the Discharge of Treated Waste Waters into Coastal Waters,
W73-10876 5C

MULTIPLE-PURPOSE RESERVOIRS
Methodological Improvements in Measuring Economic Effects of Multipurpose Water Resource Projects.
W73-10417 6B

MUNICIPAL WASTES
Process for Removal of Ammonia From Waste Water Streams,
W73-10594 5D

MUSCLE
Residues of MS-222 in Northern Pike, Muskellunge, and Walleye,
W73-10496 5A

MUSKELLUNGE
Residues of MS-222 in Northern Pike, Muskellunge, and Walleye,
W73-10496 5A

MUSSELS
Biology of Sea Mussels (Mytilus Californianus (Conrad) and M. Edulis (Linn.)) Before and After the Santa Barbara Oil Spill (1969),
W73-10866 5C

MUTANTS
Osmotic Reversal of Temperature Sensitivity in Escherichia coli,
W73-11028 5C

Radiation-Resistant Mutants of Salmonella typhimurium LT2: Development and Characterization,
W73-11029 5B

MYTILUS CALIFORNIANUS
Biology of Sea Mussels (Mytilus Californianus (Conrad) and M. Edulis (Linn.)) Before and After the Santa Barbara Oil Spill (1969),
W73-10866 5C

MYTILUS EDULIS
The Relationship Between Ions and Ciliary Activity in the Gill of Mytilus edulis,
W73-10543 5C

Biology of Sea Mussels (Mytilus Californianus (Conrad) and M. Edulis (Linn.)) Before and After the Santa Barbara Oil Spill (1969),
W73-10866 5C

MYXOBACTERIA
On the Isolation and the Bacteriolytic Activity of Some Myxobacteria Isolated in Water (Sur L'isolement Et L'activite Bacteriolytique de Quelques Myxobacteries Isolees De L'eau),
W73-10999 5A

APHTHA
Gas Chromatographic Separation, by Carbon Number and Hydrocarbon Type, of Saturated Hydrocarbon Mixtures and Different Naphthas Over Molecular Sieves 13X,
W73-11035 5A

ATRON PONDS
On the Qualitative Characteristics of the Phytoplankton of the Natron ('Szik') Ponds of Hungary,
W73-10933 5C

ATURAL RESOURCES
Assessment of Geothermal Energy Resources.
W73-10696 6B

Conceptual System Design for an Environmental Information Base for Management of Water and Related Resources by States,
W73-10725 10A

AVIGATION
Structure of a Multi-Year Pressure Ridge,
W73-10974 2C

ETWORKS
A Network for Continuous Monitoring of Water Quality in the Sabine River Basin, Texas and Louisiana,
W73-10683 5A

EUSTON
Contamination of Surfaces by Bacterial Neuston,
W73-10488 5A

EUTRALIZATION
Dewatering of Mine Drainage Sludge -Phase II,
W73-10724 5D

EUTRON ACTIVATION ANALYSIS
Two Instruments for Activation Analysis of Solutions by a Dilution Method,
W73-10509 7B

Rapid Determination of Very Low Nitrogen Levels in Water,
W73-10853 5A

EVADA
Influence of Surface and Near-Surface Caliche Distribution on Infiltration Characteristics and Flooding, Las Vegas Area, Nevada,
W73-10721 2E

Irrigability Classification of Soils, (Irrigable Soils of Nevada).
W73-10983 3F

EW HAMPSHIRE
Values and Cost Allocations of Surface-Water Use and Treatment,
W73-10558 6B

The Economic Effects of Pawtuckaway State Park: V. Effect of Park Use on Environmental Quality,
W73-10562 5C

EW HOPE CREEK (NC)
Edaphic Factors Override A Possible Gradient of Ecological Maturity Indices in a Small Stream,
W73-11003 5A

EW JERSEY
Report of Study on Ships Channels and Harbors,
W73-10576 5G

Unrecorded Pollution Sources and Optimum Water Quality Systems,
W73-10889 5B

NEW MEXICO
A Predictive Model for Upper Rio-Grande Index Flows,
W73-10620 4A

NEW YORK
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

Long Island's Approach to Environmental Quality,
W73-10573 5G

Floods in New York--1969,
W73-10655 2E

Geomorphology and Hydrology of Karst Drainage Basins and Cave Channel Networks in East Central New York,
W73-10665 2F

Town of Cairo Water Supply Report.
W73-10693 3D

NEW YORK BIGHT
Preliminary Analyses of Urban Wastes, New York Metropolitan Region,
W73-10471 5A

NEW YORK STATE FLOODS (1969)
Floods in New York--1969,
W73-10655 2E

NICKEL
Waste Water Treatment Process,
W73-10585 5D

Titrimetric Microdetermination of Nickel and Cobalt, Separately and in Presence of each Other,
W73-10863 5A

NILE DELTA (AFRICA)
Coastal Erosion in the Nile Delta,
W73-10681 2J

NITRATES
Microbial Changes and Possible Ground Water Pollution from Poultry Manure and Beef Cattle Feedlots in Georgia,
W73-10403 5B

Nitrate Reduction in the Vicinity of Tile Drains,
W73-10560 5B

Groundwater Contamination in the Cortaro Area, Pima County, Arizona,
W73-10826 5B

NITRILOTRIACETIC ACID
Influence of Na3NTA and Na4 EDTA upon the Activation of Metals in River and Lake Sediments in Michigan,
W73-10408 5B

Complexing Properties of Nitrilotriacetic Acid in the Lake Environment,
W73-10942 5C

NITROGEN
Determination of Ammoniacal Nitrogen in the Presence of Urea with an Ammonia Electrode,
W73-10474 5A

The Determination of Total Nitrogen in Plant Materials with an Automatic Nitrogen Analyser,
W73-10530 5A

Rapid Determination of Very Low Nitrogen Levels in Water,
W73-10853 5A

NITROGEN BACTERIA
Seasonal Changes of the Number of Nitrogen Cycle Bacteria in Bottom Sediments of a Pool,
W73-10641 5C

NITROGEN COMPOUNDS
The Determination of Total Nitrogen in Plant Materials with an Automatic Nitrogen Analyser,
W73-10530 5A

Exchange of Nutrients Salts Through the Kerch Strait (Obmen pitatel'nymi solyami cherez Kerchenskiy Proliv),
W73-10781 2K

NITROGEN CYCLE
Nitrogen Species Transformations of Sewage Effluent Releases in a Desert Stream Channel,
W73-10836 5D

Evaluation of a Turfgrass-Soil System to Utilize and Purify Municipal Waste Water,
W73-10837 5D

NITROGEN FIXATION
Biological Nitrogen Fixation in the Great Lakes,
W73-10511 5C

NORFOLK SANDBANKS (ENGLAND)
Tidal Current Asymmetries over the Norfolk Sandbanks,
W73-10430 2E

NORRIS RESERVOIR (TENN)
Local Economic Impact of Reservoir Recreation,
W73-10415 6B

NORTH CAROLINA
Effects of Mosquito Control Ditching on Estuarine Ecosystems,
W73-10410 5G

Edaphic Factors Override A Possible Gradient of Ecological Maturity Indices in a Small Stream,
W73-11003 5A

Algal Response to Detergent Phosphate Levels,
W73-11008 5C

NORTH DAKOTA
Water Resources Investigations in North Dakota, 1972.
W73-10980 7C

NORTHEAST U.S
Drilling for Water in New England,
W73-10796 8A

NORTHERN PIKE
Residues of MS-222 in Northern Pike, Muskellunge, and Walleye,
W73-10496 5A

NORWAY
The Phytoplankton of Lake Ovre Heimdalsvatn, Central South Norway, 1969-70,
W73-10644 5C

NORWAY (SORFJORD)
The Distribution of Heavy Metals in Sediments of Sorfjord, West Norway,
W73-10865 5B

NOTTINGHAM
The Economic Effects of Pawtuckaway State Park: V. Effect of Park Use on Environmental Quality,
W73-10562 5C

NUCLEAR MOISTURE METERS
New Acoustic Tool Logs Cased Holes,
W73-10705 8A

NUMERICAL ANALYSIS
Behavior of Groundwater Flow Subject to Time-Varying Recharge,
W73-10662 2F

Moisture Variation at the Soil Surface and the Advance of the Wetting Front During Infiltration at Constant Flux,
W73-10666 2G

NUTRIENT ANALYSIS
Influence of Vegetation and Substrate on Streamwater Chemistry in Northern Utah,
W73-10413 5B

NUTRIENT REQUIREMENTS
The Extent of Consumption of the Energy Contained in the Food Suspension of Ceriodaphnia Reticulata (Jurine),
W73-10930 5C

NUTRIENTS
An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

The Validity of the Application of Simple Kinetic Analysis to Heterogeneous Microbial Populations,
W73-10489 5C

Characteristics of the Nearshore Environment off the South Coast of Anvers Island, Antarctic Peninsula,
W73-10520 5A

Oxygen-Carbon Dioxide-Nutrients Relationships in the Northeastern Pacific Ocean and Southeastern Bering Sea,
W73-10532 5B

The Role of Flood Flows in Nutrient Supply and Removal as a Factor in the Eutrophication of the Connecticut River,
W73-10730 5C

Towards Production Biology in Running Water Ecosystems,
W73-10871 5C

OBSERVATION WELLS
Well Level Measurement Methods,
W73-10710 8G

OCEAN CURRENTS
Shelf Sediment Transport: Process and Pattern.
W73-10746 2J

An Introduction to Oceanic Water Motions and Their Relation to Sediment Transport,
W73-10747 2J

Suspended Sediments in Continental Shelf Waters off Cape Hatteras, North Carolina,
W73-10758 2J

OCEAN WAVE BREAKERS
Maximum Breaker Height,
W73-10975 8B

OCEAN WAVES
Maximum Breaker Height,
W73-10975 8B

Characteristics of Wave Records in the Coastal Zone,
W73-10979 8B

OCEANOGRAPHY
Long Island's Approach to Environmental Quality,
W73-10573 5G

Characteristics of Wave Records in the Coastal Zone,
W73-10979 8B

OCEANS
Processes Affecting the Oceanic Distribution of Carbon Dioxide,
W73-10534 5B

The IMCO Experience,
W73-10568 5G

Inorganic Phosphorus in Seawater,
W73-10680 2K

ODAGMIA-ORNATA
Towards Production Biology in Running Water Ecosystems,
W73-10871 5C

OHIO
Development of Design Storm Hyetographs for Cincinnati, Ohio,
W73-10679 2B

Model Flood Plain Zoning Ordinance,
W73-10691 6F

Evaluation of the Ohio Water Supply Program: Summary.
W73-10692 5G

OIL
A Rapid, Inexpensive Coulometric Determination of Sulphur in Petroleum Products,
W73-10510 5A

Pollution of the Marine Environment and the Effects Therefrom: The Case for Stricter Enforcement,
W73-10581 5C

OIL CHARACTERIZATION
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Tracing Oil as a Pollutant in Water,
W73-11024 5A

Identification of Heavier Aromatic Components in Reformed Petroleum Products by Direct Coupled Capillary Gas Chromatography-Mass Spectrometry,
W73-11044 5A

OIL FINGERPRINTING
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Tracing Oil as a Pollutant in Water,
W73-11024 5A

OIL INDUSTRY
Waste Water Treatment Process,
W73-10585 5D

OIL POLLUTION
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

The State of Marine Pollution in the Mediterranean and Legislative Controls.
W73-10553 5B

Waste Water Treatment Process,
W73-10585 5D

Control of Oil Pollution at Sea, Apparatus and Method,
W73-10591 5G

Floating Fire Extinguishing Apparatus and Catch Basin,
W73-10592 5G

Method for Separating Oil From Water Surface,
W73-10595 5G

Apparatus for Skimming Oil,
W73-10596 5G

Sea-Surface Oil Extractor,
W73-10597 5G

Floating Oil Skimming Apparatus with Oil and Water Separator,
W73-10599 5G

Oil Spillage Detection System,
W73-10603 5G

Effect of Seawater Soluble Fraction of Kerosene on Chemotaxis in a Marine Snail, Nassarius Obsoletus,
W73-10872 5C

The Bottom Fauna in an Oil-Contaminated Lake,
W73-10934 5C

OIL RECOVERY
Concept Evaluation: Recovery of Floating Oil Using Polyurethane Foam Sorbent,
W73-10884 5G

OIL SENSORS
Oil Spillage Detection System,
W73-10603 5G

OIL SKIMMERS
Apparatus for Skimming Oil,
W73-10596 5G

Sea-Surface Oil Extractor,
W73-10597 5G

Apparatus for Extracting Oil or the Like From the Surface of the Sea,
W73-10598 5G

Floating Oil Skimming Apparatus with Oil and Water Separator,
W73-10599 5G

OIL SPILLS
Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Multi-Sensor Detection and Tracking of Controlled Oil Spills,
W73-10467 5B

Oil Spillage, A Bibliography, Volume 1.
W73-10556 5B

Oil Spillage, A Bibliography, Volume 2.
W73-10557 5B

Control of Oil Pollution at Sea, Apparatus and Method,
W73-10591 5G

Floating Fire Extinguishing Apparatus and Catch Basin,
W73-10592 5G

Method for Separating Oil From Water Surface,
W73-10595 5G

Apparatus for Skimming Oil,
W73-10596 5G

Sea-Surface Oil Extractor,
W73-10597 5G

Apparatus for Extracting Oil or the Like From the Surface of the Sea,
W73-10598 5G

Floating Oil Skimming Apparatus with Oil and Water Separator,
W73-10599 5G

Oil Spillage Detection System,
W73-10603 5G

Oil on Puget Sound, an Interdisciplinary Study in Systems Engineering,
W73-10684 5B

Biology of Sea Mussels (Mytilus Californianus (Conrad) and M. Edulis (Linn.)) Before and After the Santa Barbara Oil Spill (1969),
W73-10866 5C

Concept Evaluation: Recovery of Floating Oil Using Polyurethane Foam Sorbent,
W73-10884 5G

Tracing Oil as a Pollutant in Water,
W73-11024 5A

OIL WASTES
Pollution Abatement Process for Refinery Waste Water,
W73-10582 5D

Waste Water Treatment Process,
W73-10585 5D

OIL-WATER INTERFACES
Oil/Water Interface Detector,
W73-10466 5A

OILY WATER
Oil/Water Interface Detector,
W73-10466 5A

Development of an Oil/Water Pollution Monitor,
W73-10491 5A

Oily Water Separation System,
W73-10535 5G

Concept Evaluation: Recovery of Floating Oil Using Polyurethane Foam Sorbent,
W73-10884 5G

OKLAHOMA
Chemical Equilibrium Models of Lake Keystone, Okla.,
W73-10480 5B

ON-SITE DATA COLLECTIONS
Use of a BOD Oxygen Probe for Estimating Primary Productivity,
W73-10517 5A

Processes Affecting the Oceanic Distribution of Carbon Dioxide,
W73-10534 5B

ON-SITE INVESTIGATIONS
Production of the Giant Kelp, Macrocystis, Estimated by In Situ Incorporation of C-14 in Polyenthylene Bags,
W73-10516 5B

A Field Fixation Technique for Dissolved Phosphate in Lake Water,
W73-10519 5C

ON-SITE TESTS
Use of a BOD Oxygen Probe for Estimating Primary Productivity,
W73-10517 5A

OPEN CHANNEL FLOW
Free-Surface Ideal Fluid Flows by Finite Elements,
W73-10988 8B

OPERATION AND MAINTENANCE
Application of Selected Industrial Engineering Techniques to Waste Water Treatment Plants,
W73-10723 5D

OPERATIONS RESEARCH
Input Specifications to a Stochastic Decision Model,
W73-10838 4A

OPTICAL EMISSION SPECTROSCOPY
Preliminary Analyses of Urban Wastes, New York Metropolitan Region,
W73-10471 5A

OPTIMAL FEEDBACK CONTROL THEORY
Optimal Feedback Control - A Synopsis,
W73-10887 7C

OPTIMIZATION
Lowest Cost-Per-Foot is Aim of Own Calculations,
W73-10791 8G

Input Specifications to a Stochastic Decision Model,
W73-10838 4A

Optimal Feedback Control - A Synopsis,
W73-10887 7C

ORE BODIES
Groundwater Wells Serve Mining Industry,
W73-10799 8A

OREGON
The Influence of Benthic Bark Deposits on Aquatic Community and the Quality of Natural Waters,
W73-10411 4C

Public Participation in Willamette Valley Environmental Decisions,
W73-10412 5G

Observations and Significance of Deep-Water Oscillatory Ripple Marks on the Oregon Continental Shelf,
W73-10771 2J

Dissolved Oxygen and Temperature in a Stratified Lake,
W73-11005 5B

ORGANIC ACIDS
Gas-Liquid-Solid Chromatography of Free Acids,
W73-10473 5A

ORGANIC COMPOUNDS
Studies in Chemical Ionization Mass Spectrometry,
W73-10541 5A

Separation and Preconcentration,
W73-10861 5A

Fast Liquid Chromatography,
W73-11022 5A

On-The-Fly Gas Chromatography-Infrared Spectrometry Using A Cholesteric Liquid Crystal-Effluent Interface,
W73-11034 5A

ORGANIC LOADING
Unrecorded Pollution Sources and Optimum Water Quality Systems,
W73-10889 5B

ORGANIC MATTER
Organic Matter in the Eastern Sivash (Organicheskoye veshchestvo v Vostochnom Sivashe),
W73-10783 2K

Saline and Organic Water Pollution,
W73-10833 3C

Biological Productivity and Balance of Organic Substance and Energy in Lake Baikal,
W73-10900 5C

Functions and Interactions of Dissolved Organic Matter and the Littoral Zone in Lake Metabolism and Eutrophication,
W73-10906 5C

ORGANIC MERCURY
Organic Mercury Compounds in Coastal Waters,
W73-10855 5A

ORGANIC SOLVENTS
The Extraction of the Chromium (III)-Edta Complex by Solutions of Aliquat-336 in Various Organic Solvents,
W73-10523 5A

The Use of Gas-Liquid Chromatography for Selecting Extractive Solvents for Liquid Extraction Processes,
W73-11036 5A

ORGANOPHOSPHORUS COMPOUNDS
Dynamics of Mineral and Organic Phosphorus in the Sea of Azov After, Regulation of Don River Flow (Dinamika mineral'nogo i organicheskogo fosfora v Azovskom more posle zaregulirovaniya stoka reki Dona),
W73-10782 2K

ORGANOPHOSPHORUS PESTICIDES
Method of Decontaminating an Organophosphorus Insecticide,
W73-10583 5G

OROGRAPHY
Effects of Orography on Distribution of Precipitation in Mountain Basins (Vliyaniye nekotorykh elementov orografii na raspredeleniye osadkov v gornykh basseynakh),
W73-10451 2B

ORTHOPHOSPHATE
A Biological Evaluation of the Molybdenum Blue Method for Orthophosphate Analysis,
W73-10943 5A

ORTHOPHOSPHATES
A Field Fixation Technique for Dissolved Phosphate in Lake Water,
W73-10519 5C

OSCILLATING FLOW
Wave Boundary Layers and Their Relation to Sediment Transport,
W73-10748 2J

OSCILLATORIA AGARDHII
Potential Heterotrophy in a Natural Population of Oscillatoria Agardhii Var. Isothrix Skuja,
W73-10946 5C

OSMOSIS
Osmotic Reversal of Temperature Sensitivity in Escherichia coli,
W73-11028 5C

OSMOTIC POTENTIAL
Comparative Study of the Plagiotheciaceae of Belgium with Regard to Certain Factors Influencing their Water Relationships with the Environment, (In French),
W73-10811 2I

OSTREA EDULIS
Growth and Metabolism of Ostrea edulis Larvae,
W73-10847 5C

OUTFALL
Simplified Method of Ocean Outfall Diffuser Analysis,
W73-10948 5B

OXALIC ACID
Microdetermination of Formic, Oxalic and Acetic Acids in Their Mixture by Selective Oxidation,
W73-10860 5A

OXIDATION
The Eutrophication Implications of Interactions Between Naturally Occurring Particulates and Methane Oxidizing Bacteria,
W73-10893 5C

OXIDATION LAGOONS
The Hydraulics of Waste Stabilization Ponds, Part I. The Effect of Hydraulic Flow Characteristics on Treatment Efficiency, Part II. The Effect of Wind on mixing in stratified and unstratified ponds.
W73-10414 5D

Effective Mixing in Shallow Bodies of Water with and without Density Stratification,
W73-10719 5D

Enteric Virus Survival in Algal-Bacterial Wastewater Treatment Systems-I. Laboratory Studies,
W73-11010 5D

OXIDATION-REDUCTION POTENTIAL
Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

A Preliminary Investigation of Organic-Inorganic Associations in a Stagnating System,
W73-11004 5B

OXYGEN
Dependence of Black Fly Larvae Distribution on the Oxygen Content in the Water, The Speed of Flow and the Nutritive Value of Water Streams, (In Russian),
W73-10639 2I

Studies on the Carp Culture in Running Water Pond: V. Oxygen Supply and Consumption in the Fish Pond and Estimation of the Amount of Harvestable Fish in a Pond, (In Japanese),
W73-10815 2I

OXYGEN DEMAND
Oxygen Demand of Effluent from a Bleached Kraft Pulp Mill,
W73-10868 5A

PACIFIC OCEAN
Oxygen-Carbon Dioxide-Nutrients Relationships in the Northeastern Pacific Ocean and Southeastern Bering Sea,
W73-10532 5B

PALAEMONETES KADIAKENSIS
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

PALEOLIMNOLOGY
The Limnology of Stockbridge Bowl, Stockbridge, Massachusetts,
W73-10561 5C

PARAGUAY RIVER BASIN (BRAZIL)
Hydrological Studies of the Upper Paraguay River Basin (Pantanal Region, Mato Grosso State, Brazil),
W73-10682 2E

PARATHION CHEMICAL
Persistence of Parathion in Six California Soils Under Laboratory Conditions,
W73-10476 5B

PARKENTSAY RIVER BASIN
Some Problems in the Water Regimen of Weakly Leached Cinnamon-Brown Soils in the Parkentsay River Basin (Nekotoryye voprosy vodnogo rezhima korichnevykh slabovyshchelochennykh pochv basseyna r. Parkentsay),
W73-10457 2G

PARKS
The Economic Effects of Pawtuckaway State Park: V. Effect of Park Use on Environmental Quality,
W73-10562 5C

PARTICLE SHAPE
Shape and Nature of Small Sedimentary Quartz Particles,
W73-10742 2J

Accelerated Motion of a Spheroid in Viscous Fluid,
W73-10989 2J

PARTICLE SIZE
Shape and Nature of Small Sedimentary Quartz Particles,
W73-10742 2J

Sediment Textural Patterns on San Pedro Shelf, California (1951-1971): Reworking and Transport by Waves and Currents,
W73-10770 2J

Well Development of Sand and Gravel Aquifers,
W73-10798 8A

PARTICULATE ORGANIC CARBON
The Carbon Cycle in the Epilimnion of Two Michigan Lakes,
W73-10538 5C

PASEO DEL RIO (TEX)
An Economic Evaluation of a Water-Based Urban Tourist Attraction in San Antonio, Texas,
W73-10564 6B

PATENTS
Pollution Abatement Process for Refinery Waste Water,
W73-10582 5D

Method of Decontaminating an Organophosphorus Insecticide,
W73-10583 5G

Process for Removing Metal Compound Contaminants From Waste Water,

W73-10585 5D

Waste Water Treatment,
W73-10586 5D

Removal of Mercury From Liquids Using Keratin Derivatives,
W73-10587 5D

Process for Recovery of Mineral Pollutants From Acidic Waste Streams,
W73-10588 5D

Desalination Plant,
W73-10589 3A

Apparatus For Cleaning Sewage Water,
W73-10590 5D

Control of Oil Pollution at Sea, Apparatus and Method,
W73-10591 5G

Floating Fire Extinguishing Apparatus and Catch Basin,
W73-10592 5G

Apparatus for Monitoring and Controlling Halogen Levels in a Water Treatment System,
W73-10593 5F

Process for Removal of Ammonia From Waste Water Streams,
W73-10594 5D

Method for Separating Oil From Water Surface,
W73-10595 5G

Apparatus for Skimming Oil,
W73-10596 5G

Sea-Surface Oil Extractor,
W73-10597 5G

Apparatus for Extracting Oil or the Like From the Surface of the Sea,
W73-10598 5G

Floating Oil Skimming Apparatus with Oil and Water Separator,
W73-10599 5G

Apparatus for Treating Waste Water,
W73-10600 5D

Multiple Expansion Flash Evaporator Comprising A Continuous Casing With A Central Evaporation Chamber,
W73-10601 3A

Machine for Removing Sedimentary Material From Filter Beds,
W73-10602 5F

Oil Spillage Detection System,
W73-10603 5G

Water-Softening Unit,
W73-10604 5F

Water Purifying Device,
W73-10605 5F

Filtration Process for Clarification,
W73-10606 5F

'ATH OF POLLUTANTS
Tracer Simulation Study of Potential Solute Movement in Port Royal Sound, South Carolina,
W73-10446 5B

Seasonal Fluctuations of Ionic Copper in Knights Pond, Massachusetts,
W73-10487 5B

Lead Outputs in Streamflow from a Watershed Ecosystem,
W73-10673 5B

Heavy Metals in British Waters,
W73-10851 5B

Absorption of Ammonia from Atmospheric Plumes by Natural Water Surfaces,
W73-10867 5B

'ATHOGENIC BACTERIA
Simultaneous Quantitation of Salmonella Species and Pseudomonas Aeruginosa. I. Polluted Waters. II. Persistence of Pathogens in Sludge Treated Soils. III. Analysis of Waste Treatment Sludges for Salmonella Species as a Surveillance Tool,
W73-10549 5B

Vibrio Parahaemolyticus Methodology for Isolation from Seafoods and Epidemic Specimens,
W73-10874 5A

'ATHOGENS
Survival of Maize Bacterial Stalk Rot Pathogens in Infected Tissue Under Different Moisture and Temperature Conditions,
W73-10800 3F

'AWTUCKAWAY STATE PARK (N.H.)
The Economic Effects of Pawtuckaway State Park: V. Effect of Park Use on Environmental Quality,
W73-10562 5C

'EBULATE
Direct Titrimetric Microdetermination of Fluorodifen, Linuron, Faneron, and Pebulate,
W73-10481 5A

'ENICILLIN ENZYME ELECTRODE
A Penicillin Selective Enzyme Electrode,
W73-11042 5A

'ENICILLINASE
A Penicillin Selective Enzyme Electrode,
W73-11042 5A

PENTACHLOROPHENOL
Microbial Decomposition of Pentachlorophenol,
W73-11048 5B

PERITRICHS
A Study of Ciliate Protozoa From a Small Polluted Stream in East-Central Illinois,
W73-10886 5D

PERMEABILITY
Evaluation of Techniques for Selecting Sites for Induced Infiltration Along the Alabama River,
W73-10401 4B

PESCICIDES
Methods of Estimating the Half-Life of Biological Activity of Toxic Chemicals in Water,
W73-10495 5C

PESTICIDE RESIDUES
Reverse Phase Thin Layer Chromatography of Some Aroclors, Halowaxes, and Pesticides,
W73-10492 5A

Gas Chromatographic Determination of Ethylene Thiourea Residues,
W73-10494 5A

Method for High-Speed Liquid Chromatographic Analysis of Benomyl and/or Metabolite Residues in Cow Milk, Urine, Feces, and Tissues,
W73-10547 5A

Chlorinated Hydrocarbon Pesticides and Related Compounds in Adipose Tissue from People of Japan,
W73-10854 5A

Detection of Organo-Phosphorus Pesticide Residues in Autopsy Tissues by Thin-Layer Chromatography,
W73-11023 5A

PESTICIDE TOXICITY
Methods of Estimating the Half-Life of Biological Activity of Toxic Chemicals in Water,
W73-10495 5C

Dynamics of a Salt of (2,4-Dichlorophenoxy) Acetic Acid in Fish, Water, and Hydrosol,
W73-10507 5C

The Uptake, Storage, and Release of Dieldrin and Some Effects of its Release in the Fish, Cichlasoma bimaculatum (Linnaeus),
W73-10536 5B

A Study of the Influence of Calcium on the Effects of DDT on Fishes,
W73-10537 5C

PESTICIDES
Zoological and Wildlife Reviews: The Conservation of Fish,
W73-10807 5C

Pesticide-Sediment-Water Interactions,
W73-10892 5B

PETROFABRICS
Shape and Nature of Small Sedimentary Quartz Particles,
W73-10742 2J

PHAGE TYPING
Phage-Typing of Staphylococcus aureus,
W73-11012 5A

PHARMACEUTICAL WASTES
Analyses of Dredged Wastes, Fly ash, and Waste Chemicals - New York Metropolitan Region,
W73-10462 5A

PHENYLMERCURIC ACETATE
Uptake and Biotransformation of Phenylmercuric Acetate by Aquatic Organisms,
W73-10477 5B

PHOSPHATES
Kinetic Study of Phosphate Reaction with Aluminum Oxide and Kalonite,
W73-10479 5B

A Field Fixation Technique for Dissolved Phosphate in Lake Water,
W73-10519 5C

The Fluorimetric Determination of Phosphate with Thiamine,
W73-10529 5A

Exchange of Nutrients Salts Through the Kerch Strait (Obmen pitatel'nymi solyami cherez Kerchenskiy Proliv),
W73-10781 2K

Dynamics of Mineral and Organic Phosphorus in the Sea of Azov After, Regulation of Don River Flow (Dinamika mineral'nogo i organicheskogo fosfora v Azovskom more posle zaregulirovaniya stoka reki Dona),
W73-10782 2K

Competition Between an Alga and an Aquatic Bacterium for Phosphate,
W73-10894 5C

A Biological Evaluation of the Molybdenum Blue Method for Orthophosphate Analysis,
W73-10943 5A

Algal Response to Detergent Phosphate Levels,
W73-11008 5C

PHOSPHORUS
Influence of Na3NTA and Na4 EDTA upon the Activation of Metals in River and Lake Sediments in Michigan,
W73-10408 5B

Inorganic Phosphorus in Seawater,
W73-10680 2K

Selective Determination of Hetero-Organics by a Dual-Channel Detector Based on Flame Conductivity and Emission,
W73-11040 5A

PHOTODECOMPOSITION
Comparative Studies of Thin Layer Chromatographic Systems for the Separation and Identification of Photoalteration Products of Parathion,
W73-10493 5A

PHOTOGRAMMETRY
Precise Water Velocity Measurements Using Photogrammetric Techniques,
W73-10678 5B

PHOTOGRAPHY
Currents and Sediment Transport at the Wilmington Canyon Shelfbreak, as Observed by Underwater Television,
W73-10772 2J

PHOTOSYNTHESIS
Diurnal Periodicity in the Phytoplankton Assemblage of a High Mountain Lake,
W73-10461 5C

Production of the Giant Kelp, Macrocystis, Estimated by In Situ Incorporation of C-14 in Polyenthylene Bags,
W73-10516 5B

Photosynthetic Productivity in the Ajwa Reservoir at Baroda, West India,
W73-10925 5C

PHOTOSYNTHETIC RATES
Production of the Giant Kelp, Macrocystis, Estimated by In Situ Incorporation of C-14 in Polyenthylene Bags,
W73-10516 5B

Use of a BOD Oxygen Probe for Estimating Primary Productivity,
W73-10517 5A

PHREATOPHYTES
Woody Phreatophytes Along the Brazos River and Selected Tributaries Above Possum Kingdom Lake,
W73-10745 3B

PHTHALATE ESTERS
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

PHYSICAL PROPERTIES
Atomic Fluorescence Characteristics of Copper in Various Premixed Flames,
W73-10531 5A

Reinforced Thermoplastics and Thermosets for Corrosion Control: State of the Art,
W73-10708 8G

Phytoplankton Production, Chemical and Physical Conditions in Loch Leven,
W73-10922 5C

Comparison of the Physical and Chemcial Environments of Volta Lake and Lake Nasser,
W73-10931 5C

PHYTOPLANKTON
Diurnal Periodicity in the Phytoplankton Assemblage of a High Mountain Lake,
W73-10461 5C

Biological Nitrogen Fixation in the Great Lakes,
W73-10511 5C

An Ecological Study of Three Fresh Water Ponds of Hyderabad-India: II. The Environment,
W73-10625 5C

The Phytoplankton of Lake Ovre Heimdalsvatn, Central South Norway, 1969-70,
W73-10644 5C

The Seasonal Variation of Some Ecological Efficiencies and Production Rates in the Plankton Community of Several Polish Lakes of Different Trophy,
W73-10897 5C

Distribution Pattern of Phytoplankton and Bacteria, Microbial Decomposition of Organic Matter and Bacterial Production in Eutrophic, Stratified Lake,
W73-10901 5C

Phytoplankton Production, Chemical and Physical Conditions in Loch Leven,
W73-10922 5C

Observations on Primary Production of Phytoplankton in Two Fish Ponds,
W73-10924 5C

Comparison of Some Methods of Determining the Primary Production of Phytoplankton in Ponds,
W73-10929 5C

On the Qualitative Characteristics of the Phytoplankton of the Natron ('Szik') Ponds of Hungary,
W73-10933 5C

Phytoplankton Observations in the Eastern Caribbean Sea,
W73-11006 5A

Observations on the Transparency of the Waters of the Pulicat Lake with Particular Reference to Plankton Production,
W73-11046 5C

PIEDMONT (SOUTH CAROLINA)
The Interflow Process on Sloping Watershed Areas,
W73-10563 2G

PIERS
Suggested Design and Construction Procedures for Pier Foundations.
W73-10611 8F

PIGMENTS
Edaphic Factors Override A Possible Gradient of Ecological Maturity Indices in a Small Stream,
W73-11003 5A

PIKE PERCH
Data on the Feeding of the Youngest Age Groups of Pike Perch Lucioperca Lucioperca (L.) In the Pskov-Chudskoe Lake, (In Russian),
W73-10613 2H

PIPELINES
Practical Interference Current Testing on Underground Metallic Structures,
W73-10610 8G

PLAGIOTHECIACEAE
Comparative Study of the Plagiotheciaceae of Belgium with Regard to Certain Factors Influencing their Water Relationships with the Environment, (In French),
W73-10811 2I

PLANKTON
Density Gradient Centrifugation as an Aid to Sorting Planktonic Organisms: I. Gradient Materials,
W73-10813 2I

PLANNING
Federal Interaction with States,
W73-10572 5G

Water Quality Management Plan, Interim St. Croix River Basin.
W73-10689 5G

Town of Cairo Water Supply Report.
W73-10693 3D

An Annotated Outline of a Water-Resources Development Plan for Alabama,
W73-10694 6B

W.A.L.R.U.S. I Water and Land Resource Utilization Simulation,
W73-10735 6A

Virginia Water Policy: The Imprecise Mandate,
W73-10890 6E

PLANT CELLS
Study of the State of Water and Water Exchange of a Plant Cell by IR Absorption Spectra, (In Russian),
W73-10702 7B

PLANT GROWTH
Field Laser,
W73-10958 3B

PLANT GROWTH REGULATORS
The Effect of Root Geometry on the Yield of Wheat Growing on Stored Water,
W73-10701 3F

PLANT MORPHOLOGY
The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

PLANT PHYSIOLOGY
The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

PLANT POPULATIONS
Potential Heterotrophy in a Natural Population of Oscillatoria Agardhii Var. Isothrix Skuja,
W73-10946 5C

PLANT TISSUES
Production of the Giant Kelp, Macrocystis, Estimated by In Situ Incorporation of C-14 in Polyenthylene Bags,
W73-10516 5B

The Determination of Total Nitrogen in Plant Materials with an Automatic Nitrogen Analyser,
W73-10530 5A

Study of the State of Water and Water Exchange of a Plant Cell by IR Absorption Spectra, (In Russian),
W73-10702 7B

PLASMA
The Determination of Trace Metals and Their Significance in Clinical Chemistry,
W73-11030 5A

PLASTIC PIPES
Reinforced Thermoplastics and Thermosets for Corrosion Control: State of the Art,
W73-10708 8G

PLASTICS
Reinforced Thermoplastics and Thermosets for Corrosion Control: State of the Art,
W73-10708 8G

PLOWING
The Effect of Plowing Under Corn Straw on Some Soil Properties and the Yield of Corn Under Conditions of Dry Farming and Irrigation, (In Serbo-Croatran),
W73-10637 3F

PODON POLYPHEMOIDES
Diurnal Vertical Migration of an Estuarine Cladoceran, Podon Polyphemoides, in the Chesapeake Bay,
W73-10941 2L

POISONS
A Study of the Influence of Calcium on the Effects of DDT on Fishes,
W73-10537 5C

POLAND
The Seasonal Variation of Some Ecological Efficiencies and Production Rates in the Plankton Community of Several Polish Lakes of Different Trophy,
W73-10897 5C

POLARIZATION
Fundamentals of Cathodic Protection,
W73-10784 8G

POLITICAL ASPECTS
Historical, Political and Social Factors Affecting Public Policy on River Diversion: Out-of-Basin Diversion of Connecticut River Flood Waters to the Boston Metropolitan Area,
W73-10727 3D

POLLUTANT IDENTIFICATION
A Rapid Sensitive Method For the Determination of the Chemical Oxygen Demand of Polluted Waters,
W73-10434 5A

Correlation of Oils and Oil Products by Gas Chromatography,
W73-10459 5A

Gas-Liquid-Solid Chromatography of Free Acids,
W73-10473 5A

Iron-Phosphate Compound Identification in Sewage Sludge Residue,
W73-10478 5A

Dry Ashing Technique for the Determination of Arsenic in Marine Fish,
W73-10482 5A

Rapid, Sensitive Method for Determination of Mercury in a Variety of Biological Samples,
W73-10483 5A

Reverse Phase Thin Layer Chromatography of Some Aroclors, Halowaxes, and Pesticides,
W73-10492 5A

Comparative Studies of Thin Layer Chromatographic Systems for the Separation and Identification of Photoalteration Products of Parathion,
W73-10493 5A

Gas Chromatographic Determination of Ethylene Thiourea Residues,
W73-10494 5A

Ultrastructure of Staphylococcus epidermidis after Freeze-Etching and Thin Sectioning,
W73-10500 5A

Studies of the Cell Envelope of Vibrio Parahaemolyticus,
W73-10501 5A

Hydrolysis of Aqueous Solutions of Sodium 2,2-Dichloropropionate Under Self-Induced Alkaline Conditions,
W73-10506 5B

Trace Element Analysis by Proton-Induced X-Ray Excitation,
W73-10508 5A

A New, Sensitive Method For the Determination of Streptomycin,
W73-10514 5A

The Atomic Absorption Determination of Zinc with a Graphite Furnace,
W73-10515 5A

The Fluorimetric Determination of Phosphate with Thiamine,
W73-10529 5A

Studies in Chemical Ionization Mass Spectrometry,
W73-10541 5A

Gas Chromatography of Organonitrogen Pesticides, Using a Nitrogen-Specific Detection System,
W73-10548 5A

Simultaneous Quantitation of Salmonella Species and Pseudomonas Aeruginosa. I. Polluted Waters. II. Persistence of Pathogens in Sludge Treated Soils. III. Analysis of Waste Treatment Sludges for Salmonella Species as a Surveillance Tool,
W73-10549 5B

Halogenated Compounds for the Sensitive Detection of Clostridia by Gas Chromatography,
W73-10550 5A

Bacterial Identification by Microcalorimetry,
W73-10848 5A

Occurrence of some Chlorinated Aliphatic Hydrocarbons in the Environment,
W73-10850 5B

Rapid Determination of Very Low Nitrogen Levels in Water,
W73-10853 5A

Chlorinated Hydrocarbon Pesticides and Related Compounds in Adipose Tissue from People of Japan,
W73-10854 5A

Organic Mercury Compounds in Coastal Waters,
W73-10855 5A

New Methods for the Determination of Elements in Trace Amounts,
W73-10862 5A

Titrimetric Microdetermination of Nickel and Cobalt, Separately and in Presence of each Other,
W73-10863 5A

The Distribution of Heavy Metals in Sediments of Sorfjord, West Norway,
W73-10865 5B

On the Isolation and the Bacteriolytic Activity of Some Myxobacteria Isolated in Water (Sur L'isolement Et L'activite Bacteriolytique de Quelques Myxobacteries Isolees De L'eau),
W73-10999 5A

Experimental Treatment of Surface Water Purification by Lagoons: Chemical and Microbiological Aspects, (Traitement Experimental d'Epuration d'Une eau de Surface Par Lanunage: Aspects Chimiques et Microbiologiques),
W73-11000 5B

A Zoogloea Bacterium with Gelatinous Mucopolysaccharide Matrix,
W73-11009 5A

Phage-Typing of Staphylococcus aureus,
W73-11012 5A

Fast Liquid Chromatography,
W73-11022 5A

Tracing Oil as a Pollutant in Water,
W73-11024 5A

Differentiation of Some Enterococci by Gas Chromatography,
W73-11027 5A

Osmotic Reversal of Temperature Sensitivity in Escherichia coli,
W73-11028 5C

Radiation-Resistant Mutants of Salmonella typhimurium LT2: Development and Characterization,
W73-11029 5B

POLLUTANTS
Pollution in Some British Estuaries and Coastal Waters.
W73-10554 5B

A Prototype Totalising Current-Meter (Mark II); A Self-Moored Version for Near-Surface Use Especially in Foul Water Estuaries in Connection with Pollutant Dispersal Studies,
W73-10580 5B

Ecological Significance of the Discharge of Treated Waste Waters into Coastal Waters,
W73-10876 5C

POLLUTION ABATEMENT
Method of Decontaminating an Organophosphorus Insecticide,
W73-10583 5G

Control of Oil Pollution at Sea, Apparatus and Method,
W73-10591 5G

Floating Fire Extinguishing Apparatus and Catch Basin,
W73-10592 5G

Method for Separating Oil From Water Surface,
W73-10595 5G

Apparatus for Skimming Oil,
W73-10596 5G

Sea-Surface Oil Extractor,
W73-10597 5G

Apparatus for Extracting Oil or the Like From the Surface of the Sea,
W73-10598 5G

Floating Oil Skimming Apparatus with Oil and Water Separator,
W73-10599 5G

Apparatus for Treating Waste Water,
W73-10600 5D

Oil Spillage Detection System,
W73-10603 5G

Dynamics of Waste Accumulation: Disposal Versus Recycling,
W73-10739 5G

Pricing of Pollution: The Coase Theorem in the Long Run,
W73-10740 5G

POLLUTION TAXES (CHARGES)
Dynamics of Waste Accumulation: Disposal Versus Recycling,
W73-10739 5G

Pricing of Pollution: The Coase Theorem in the Long Run,
W73-10740 5G

POLYCHAETES
Study of the Contamination of Arenicola Marina L. by Cobalt-60, (Etude de la Contamination d'Arenicola Marina L. (Annelide Polychete) Par LM Cobalt-60),
W73-10551 5C

POLYCHLORINATED BIPHENYLS
Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-10490 5B

Reverse Phase Thin Layer Chromatography of Some Aroclors, Halowaxes, and Pesticides,
W73-10492 5A

Geographic Differences in Phytoplankton Sensitivity to PCBS,
W73-10849 5C

Chlorinated Hydrocarbon Pesticides and Related Compounds in Adipose Tissue from People of Japan,
W73-10854 5A

POLYURETHANE FOAMS
Concept Evaluation: Recovery of Floating Oil Using Polyurethane Foam Sorbent,
W73-10884 5G

PONDEROSA PINE
Predicting Degree Day Snow Melt Factors with Crown Closure in Arizona Ponderosa Pine,
W73-10697 2E

PONDS
An Evaluation of Current Practices in Seepage Control,
W73-10828 4A

Results of the Study of Some Links of the Food Chain in a Carp Pond in Czechoslovakia,
W73-10917 5C

Some Observations on Primary and Fish Production in Experimental Fish Ponds in Malacca, Malaysia,
W73-10918 5C

Observations on Primary Production of Phytoplankton in Two Fish Ponds,
W73-10924 5C

The Primary Productivity of a Fish-Pond at Ile-Ife, Nigeria,
W73-10928 5C

Comparison of Some Methods of Determining the Primary Production of Phytoplankton in Ponds,
W73-10929 5C

On the Qualitative Characteristics of the Phytoplankton of the Natron ('Szik') Ponds of Hungary,
W73-10933 5C

POROUS MEDIA
Friction Factor and Reynolds Number in Porous Media Flow,
W73-10991 2F

PORT FACILITIES
Report of Study on Ships Channels and Harbors,
W73-10576 5G

PORT ROYAL SOUND (SC)
Tracer Simulation Study of Potential Solute Movement in Port Royal Sound, South Carolina,
W73-10446 5B

POTABLE WATER
Evaluation of the Ohio Water Supply Program: Summary.
W73-10692 5G

Concentration of Virus from Water by Electro-Osmosis and Forced-Flow Electrophoresis: II. Improvement of Methodology and Application to Tap Water,
W73-10817 5F

POTASSIUM
A Simple Modification of a Flame Photometer for Routine Trace Potassium Analysis,
W73-10852 5A

POTASSIUM COMPOUNDS
Population Dynamics and the Effect of Inorganic Ions on Certain Microcrustacea,
W73-10542 5C

POTASSIUM FERTILIZER
The Effect of Potassium on the Water Regime of the Cotton Plant, (In Azerbaijamian),
W73-10633 3F

POTENTIAL EVAPOTRANSPIRATION
Frequency Analyses of the Ratio of Actual to Potential Evapotranspiration for the Study of Climate and Vegetation Relationships,
W73-10421 2D

POULTRY
Microbial Changes and Possible Ground Water Pollution from Poultry Manure and Beef Cattle Feedlots in Georgia,
W73-10403 5B

POWERHOUSES
The Cluster Layout--A New Concept for Pumper-Storage,
W73-10618 8C

POWERPLANTS
Biological Productivity of Kurakhov's Power Station Cooling Reservoir,
W73-10913 5C

PRECIPITATION AMOUNTS FORECASTING
Peatmos Probability of Precipitation Forecasts as an Aid in Predicting Precipitation Amounts,
W73-10426 2B

PRECIPITATION (ATMOSPHERIC)
Peatmos Probability of Precipitation Forecasts as an Aid in Predicting Precipitation Amounts,
W73-10426 2B

Effects of Orography on Distribution of Precipitation in Mountain Basins (Vliyaniye nekotorykh elementov orografii na raspredeleniye osadkov v gornykh basseynakh),
W73-10451 2B

Computation of Monthly Solid Precipitation from Total Monthly Precipitation and Average Monthly Air Temperature (Raschet mesyachnykh summ tverdykh osadkov po obshchim mesyachnym summam osadkov i srednim mesyachnym znacheniyam temperat ury vozdukha),
W73-10452 2C

Interception of Precipitation by Vegetation and its Determination in Water-Balance Investigations (Perekhvat atmosfernykh osadkov rastitel'nost'yu i yego uchet pri vodnobalansovykh issledovaniyakh),
W73-10453 2B

Water Regime of Sod-Brown Soils and Relation of Tea-Leaf Yield to Precipitation (Vodnyy rezhim dernovo-burozemnykh pochv i zavisimost' urozhaya chaynogo lista ot osadkov),
W73-10776 2G

PRECIPITATION (ATOMOSPHERIC)
Water Balance in Soviet Central Asisa (Vodnyy balans territorii Sredney Azii).
W73-10448 2A

PRECIPITATION INTENSITY
Peatmos Probability of Precipitation Forecasts as an Aid in Predicting Precipitation Amounts,
W73-10426 2B

PRECONCENTRATION
Separation and Preconcentration,
W73-10861 5A

PRESSURE RIDGES
Structure of a Multi-Year Pressure Ridge,
W73-10974 2C

PRICE RIVER BASIN (UTAH)
Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Price River Basin, Utah,
W73-10423 2K

PRIMARY PRODUCTION
The Chalk-Stream Ecosystem,
W73-10921 5C

PRIMARY PRODUCTIVITY
Enhancement of Net Primary Productivity by Herbivore Grazing in Aquatic Laboratory Microcosms,
W73-10460 5C

Diurnal Periodicity in the Phytoplankton Assemblage of a High Mountain Lake,
W73-10461 5C

An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

Use of a BOD Oxygen Probe for Estimating Primary Productivity,
W73-10517 5A

Biological Productivity of Lakes Krivoe and Krugloe,
W73-10896 5C

The Seasonal Variation of Some Ecological Efficiencies and Production Rates in the Plankton Community of Several Polish Lakes of Different Trophy,
W73-10897 5C

The Production Processes in Several Polish Lakes,
W73-10898 5C

Production and Decomposition in the Eulittoral Zone of Lakes,
W73-10903 5C

Energy Transformations Through Primary Productivity and Fish Production in Some Tropical Freshwater Impoundments and Ponds,
W73-10915 5C

Some Observations on Primary and Fish Production in Experimental Fish Ponds in Malacca, Malaysia,
W73-10918 5C

Intensification of Fish Ponds Production,
W73-10919 5C

Primary Production of a Montane River,
W73-10923 5C

Observations on Primary Production of Phytoplankton in Two Fish Ponds,
W73-10924 5C

The Regulation of Net Primary Production in Lake George, Uganda, East Africa,
W73-10926 5C

Comparative Trends of Primary Productivity and Some Chemical Parameters in Lake Maggiore on a Pluriannual Basis,
W73-10927 5C

The Primary Productivity of a Fish-Pond at Ile-Ife, Nigeria,
W73-10928 5C

Comparison of Some Methods of Determining the Primary Production of Phytoplankton in Ponds,
W73-10929 5C

Edaphic Factors Override A Possible Gradient of Ecological Maturity Indices in a Small Stream,
W73-11003 5A

PROBABILITY

Shelf Sediment Transport: A Probability Model,
W73-10755 2J

The Construction of a Probability Distribution for Rainfall on a Watershed by Simulation,
W73-10842 2B

Objective and Subjective Analysis of Transition Probabilities of Monthly Flow on an Ephemeral Stream,
W73-10843 2E

PROBABLE MAXIMUM PRECIPITATION

Peatmos Probability of Precipitation Forecasts as an Aid in Predicting Precipitation Amounts,
W73-10426 2B

PRODUCTIVITY

Productivity Problems of Freshwaters.
W73-10895 5C

Biological Productivity of Lakes Krivoe and Krugloe,
W73-10896 5C

PROTECTION

California's Marine Program,
W73-10577 5G

PROTON ACTIVATION ANALYSIS

Trace Element Analysis in Water by Proton Activation,
W73-11033 5A

PROTOTYPES

Mechanical Harvesting of Water Hyacinth in Shell Creek Reservoir, Charlotte County, Florida,
W73-10962 3B

PROTOZOA

A Study of Ciliate Protozoa From a Small Polluted Stream in East-Central Illinois,
W73-10886 5D

PROVENANCE

Sources and Sinks of Suspended Matter on Continental Shelves,
W73-10757 2J

Mineralogy of Suspended Sediment off the Southeastern United States,
W73-10759 2J

Onshore Transportation of Continental Shelf Sediment: Atlantic Southeastern United States,
W73-10767 2J

PSEUDOCODIUM FLORIDANUM

A New Species of Pseudocodium (Chlorophyta, Siphonales) from the West Coast of Florida,
W73-10470 5A

PSEUDOMONAS

Competition Between an Alga and an Aquatic Bacterium for Phosphate,
W73-10894 5C

PSEUDOMONAS AERUGINOSA

Simultaneous Quantitation of Salmonella Species and Pseudomonas Aeruginosa. I. Polluted Waters. II. Persistence of Pathogens in Sludge Treated Soils. III. Analysis of Waste Treatment Sludges for Salmonella Species as a Surveillance Tool,
W73-10549 5B

U.S. DEPARTMENT OF COMMERCE

PSKOV-CHUDSKOE LAKE
Data on the Feeding of the Youngest Age Groups of Pike Perch Lucioperca Lucioperca (L.) In the Pskov-Chudskoe Lake, (In Russian),
W73-10613 2H

PSYCHOLOGICAL ASPECTS
An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

PUBLIC PARTICIPATION
Public Participation in Willamette Valley Environmental Decisions,
W73-10412 5G

PUBLICATION
Hydrology and Water Resources in Arizona and the Southwest, Volume 2.
W73-10818 2A

PUGET SOUND (WASH)
Oil on Puget Sound, an Interdisciplinary Study in Systems Engineering,
W73-10684 5B

PULP AND PAPER INDUSTRY
Oxygen Demand of Effluent from a Bleached Kraft Pulp Mill,
W73-10868 5A

PULP WASTES
Oxygen Demand of Effluent from a Bleached Kraft Pulp Mill,
W73-10868 5A

Effects of Kraft Mill Effluent on a Marine Benthic Community,
W73-10869 5C

PUMPED STORAGE
The Cluster Layout--A New Concept for Pumper-Storage,
W73-10618 8C

An Evaluation of the Possible Effects of Water Diversion of the Connecticut River on the Biology of Anadromous Fish in the River,
W73-10729 2I

PUSH-NET SAMPLING SYSTEM
A Quantitative Push-Net System for Transect Studies of Larval Fish and Macrozooplankton,
W73-10485 7B

QUARTZ
Shape and Nature of Small Sedimentary Quartz Particles,
W73-10742 2J

RADAR IMAGES
Side-Look Radar Provides a New Tool for Topographic and Geological Surveys,
W73-10615 7B

RADIATION
60 GHz Radiometric Local Vertical Sensor Experiment,
W73-10743 7B

Summary of CO2 Laser-Water Hyacinth Laboratory Research,
W73-10957 3B

Radiation-Resistant Mutants of Salmonella typhimurium LT2: Development and Characterization,
W73-11029 5B

RADIO WAVES
60 GHz Radiometric Local Vertical Sensor Experiment,
W73-10743 7B

RADIOACTIVE DATING
Dating Cave Calcite Deposits by the Uranium Disequilibrium Method: Some Preliminary Results from Crowsnest Pass, Alberta,
W73-10978 2J

RADIOACTIVITY
Study of the Contamination of Arenicola Marina L. by Cobalt-60, (Etude de la Contamination d'Arenicola Marina L. (Annelide Polychete) Par LM Cobalt-60),
W73-10551 5C

RADIOACTIVITY TECHNIQUES
Dynamics of a Salt of (2,4-Dichlorophenoxy) Acetic Acid in Fish, Water, and Hydrosol,
W73-10507 5C

Rapid Determination of Very Low Nitrogen Levels in Water,
W73-10853 5A

RADIOMETRIC VERTICAL SENSOR
60 GHz Radiometric Local Vertical Sensor Experiment,
W73-10743 7B

RADISH
Comsumption of Water and Frequency of Irrigation in Radish (Raphanus sativus L.), By Neutron Moderation Method in Soil Moisture Determinations, (In Portuguese),
W73-10629 3F

RAIN
Direct Measurement of Less Than 1 Part-Per-Billion Fluoride in Rain, Fog, and Aerosols with an Ion-Selective Electrode,
W73-10526 5A

The Indirect Spectrophotometric Determination of the Sulphate Ion With 2-Aminoperimidine,
W73-10527 5A

RAIN GAGES
Initial Wetting Losses Incurred by Ground Level Stereo Gages,
W73-10659 2G

RAINFALL
The Construction of a Probability Distribution for Rainfall on a Watershed by Simulation,
W73-10842 2B

RAINFALL DISPOSITION
Effects of Orography on Distribution of Precipitation in Mountain Basins (Vliyaniye nekotorykh elementov orografii na raspredeleniye osadkov v gornykh basseynakh),
W73-10451 2B

A Proposed Model for Flood Routing in Abstracting Ephemeral Channels,
W73-10844 2E

Water Disposition in Ephemeral Stream Channels,
W73-10846 2E

RAINFALL-RUNOFF RELATIONSHIPS
Synthesis and Evaluation of Urban-Regional Hydrologic Rainfall-Runoff Criteria,
W73-10416 2A

Runoff Characteristics of California Streams,
W73-10447 2E

The Application of a Simple Rainfall-Runoff Model to a Catchment with Incomplete Data Coverage,
W73-10656 2A

Development of Design Storm Hyetographs for Cincinnati, Ohio,
W73-10679 2B

Significance of Antecedent Soil Moisture to a Semiarid Watershed Rainfall Runoff Relation,
W73-10841 2G

Hydrologic Modeling, Parameter Estimation, and Watershed Characteristics,
W73-10964 2A

RANUNCULUS-FLUITANS
Ranunculus Fluitans Lamarck in Lyon,
W73-10646 5B

RARE EARTH ELEMENTS
Preliminary Analyses of Urban Wastes, New York Metropolitan Region,
W73-10471 5A

RATE OF APPLICATION
Water Infiltration Under Center-Pivots,
W73-10698 3F

REACTION RATE
How Conditions Affect Reaction Rate of Well-Treating Acids,
W73-10707 8A

REAL COSTS
Through the Mini Maze,
W73-11015 7C

RECHARGE
Behavior of Groundwater Flow Subject to Time-Varying Recharge,
W73-10662 2F

Hydrologic Studies Using the Boussinesq Equation with a Recharge Term,
W73-10671 2F

RECHARGE PONDS
Fate of Suspended Sediment During Basin Recharge,
W73-10668 2J

RECORD KEEPING
Notes on Developing Ground Waters,
W73-10711 4B

The Health and Care of Wells,
W73-10794 8B

RECORDS
Well Operation,
W73-10714 8A

RECREATION
Local Economic Impact of Reservoir Recreation,
W73-10415 6B

RECREATION DEMAND
Computer Simulation of Recreational Boating Activities,
W73-10623 6A

An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

RECREATION FACILITIES
A Sequential Decision Approach in Recreational Analysis,
W73-10619 6B

An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

RECYCLING
Dynamics of Waste Accumulation: Disposal Versus Recycling,
W73-10739 5G

Saline and Organic Water Pollution,
W73-10833 3C

RED ROCK CANYON FAN (NEV.)
Influence of Surface and Near-Surface Caliche Distribution on Infiltration Characteristics and Flooding, Las Vegas Area, Nevada,
W73-10721 2E

REFINERY WASTES
Pollution Abatement Process for Refinery Waste Water,
W73-10582 5D

REFORMATES
Identification of Heavier Aromatic Components in Reformed Petroleum Products by Direct Coupled Capillary Gas Chromatography-Mass Spectrometry,
W73-11044 5A

REGENERATION CHAMBERS
Water-Softening Unit,
W73-10604 5F

REGIMEN
Some Problems in the Water Regimen of Weakly Leached Cinnamon-Brown Soils in the Parkentsay River Basin (Nekotoryye voprosy vodnogo rezhima korichnevykh slabovyshchelochennykh pochv basseyna r. Parkentsay),
W73-10457 2G

REGIONS
Some Results and Ways of Developing Methods of Streamflow Measurement in Mountain Countries (Nekotoryye itogi i puti razvitiya sposobov rascheta stoka v usloviyakh gornykh stran),
W73-10449 7B

REGISTRATION
International Co-operation for Pollution Control,
W73-10566 5G

REGRESSION ANALYSIS
A Method for Computing Regression Coefficients Utilizing Incomplete Observations,
W73-10533 7B

A Predictive Model for Upper Rio-Grande Index Flows,
W73-10620 4A

Predicting Degree Day Snow Melt Factors with Crown Closure in Arizona Ponderosa Pine,
W73-10697 2E

What is the Role of Flood Flows in the Pollution of the Connecticut River and its Amelioration,
W73-10731 5B

REGRESSION COEFFICIENTS
A Method for Computing Regression Coefficients Utilizing Incomplete Observations,
W73-10533 7B

REGULATED FLOW
Dynamics of Mineral and Organic Phosphorus in the Sea of Azov After, Regulation of Don River Flow (Dinamika mineral'nogo i organicheskogo fosfora v Azovskom more posle zaregulirovaniya stoka reki Dona),
W73-10782 2K

REHABILITATION
Ecosystem Studies in Connection with the Restoration of Lakes,
W73-10935 5C

REHABILITATION (WELLS)
Less Time, Fewer Hazards with Pelletized Acid,
W73-10709 8G

RELIABILITY
Loading and Design of Transmission Towers,
W73-10616 8C

REMOTE SENSING
Snow Studies Using Thermal Infrared Measurements from Earth Satellites,
W73-10435 2C

Water Quality Determinations In the Virgin Islands from ERTS-A Data,
W73-10437 5B

Multi-Sensor Detection and Tracking of Controlled Oil Spills,
W73-10467 5B

A Network for Continuous Monitoring of Water Quality in the Sabine River Basin, Texas and Louisiana,
W73-10683 5A

Electromagnetic Depth Sounding Experiment Across Santa Clara Valley,
W73-10720 4B

60 GHz Radiometric Local Vertical Sensor Experiment,
W73-10743 7B

Currents and Sediment Transport at the Wilmington Canyon Shelfbreak, as Observed by Underwater Television,
W73-10772 2J

REPRODUCTION
Agrometeorological Indicators of the Maize Development in the Reproduction Period, (In Bulgarian),
W73-10635 3F

RESEARCH
International Environmental Controls in the Scientific Age,
W73-10567 5G

RESEARCH AND DEVELOPMENT
The Water Resources Programs of the U.S. Geological Survey,
W73-10674 2E

RESEARCH APPLICATION
Synthesis and Evaluation of Urban-Regional Hydrologic Rainfall-Runoff Criteria,
W73-10416 2A

RESEARCH VESSELS
Modifications of the Birge-Ekman Box Corer for Use with Scuba or Deep Submergence Research Vessels,
W73-10486 7B

RESERVOIR OPERATION
Stochastic Models Applied to Operation of Reservoirs in the Upper Colorado River Basin in Texas,
W73-10565 2A

RESERVOIR SILTING
The Effect of Silting on Flow Profile Upstream of Weirs--A Case Study,
W73-10994 8B

Sedimentation Studies of Bhakra Reservoir,
W73-10998 2J

RESERVOIRS
Raw Water Transmission System for Springfield, Mass.,
W73-10687 8A

Productivity of Aquatic Organism Communities of Different Trophic Levels in Kiev Reservoir,
W73-10911 5C

Biological Productivity of Kurakhov's Power Station Cooling Reservoir,
W73-10913 5C

Biological Productivity of the Rybinsk Reservoir,
W73-10914 5C

Base for a Model of the Slapy Reservoir Ecosystem,
W73-10916 5C

Photosynthetic Productivity in the Ajwa Reservoir at Baroda, West India,
W73-10925 5C

RESIDENTIAL WATER
Water Use, (AWWA Committee Report).
W73-10741 6D

RESOURCE ALLOCATION
Values and Cost Allocations of Surface-Water Use and Treatment,
W73-10558 6B

The Development of A Plan of Study--An Interagency Approach to Multiobjective Planning and Evaluation of Water and Land Resource Use,
W73-10622 6A

RESOURCES
Ocean Utilization and Coastal Zone Development.
W73-10579 2L

A Comparative Study of Resource Analysis Methods,
W73-10737 6A

RESOURCES DEVELOPMENT
Department of Interior Program,
W73-10571 5G

Federal Interaction with States,
W73-10572 5G

RESPIRATION
Edaphic Factors Override A Possible Gradient of Ecological Maturity Indices in a Small Stream,
W73-11003 5A

REVERSE OSMOSIS
Water Purifying Device,
W73-10605 5F

REVIEWS
The International Hydrological Decade--A Preliminary Evaluation of a Cooperative Effort in the Earth Science Field,
W73-10424 2A

Pesticide-Sediment-Water Interactions,
W73-10892 5B

REYNOLDS NUMBER
Friction Factor and Reynolds Number in Porous Media Flow,
W73-10991 2F

RHEOLOGY
Nonlinear Stability of Plane Poiseuille Flow of Viscoelastic Liquids,
W73-10428 2E

RHODOPHYTA
Freshwater Algae From the Itasca State Park Minnesota, IV. Cyanophta, Rhodophyta, Chloromonadophyceae, and Cryptophyceae,
W73-10544 5A

RHONE RIVER
Ranunculus Fluitans Lamarck in Lyon,
W73-10646 5B

RICE GROWING
Rice Growing in Deep Water in Mali,
W73-10628 3F

RIO GRANDE RIVER
A Predictive Model for Upper Rio-Grande Index Flows,
W73-10620 4A

RIPPLE MARKS
Observations and Significance of Deep-Water Oscillatory Ripple Marks on the Oregon Continental Shelf,
W73-10771 2J

RIVER BASINS
Effects of Orography on Distribution of Precipitation in Mountain Basins (Vliyaniye nekotorykh elementov orografii na raspredeleniye osadkov v gornykh basseynakh),
W73-10451 2B

RIVER THAMES (ENGLAND)
Productivity and Energy Flow at all Trophic Levels in the River Thames, England,
W73-10920 5C

RIVERS
Primary Production of a Montane River,
W73-10923 5C

ROACH
Food Supply of Roach Underyearlings Rutilus rutilus (L.) in the Mozhaiskii Reservoir (In Russian),
W73-10458 2H

Seasonal Dynamics of Biological Indices of Roach Rutilus Rutilus (L.) with Different Food Supplies, (In Russian),
W73-10484 2I

The Reactions of Roach (Rutilus rutilus (L.)) to Changes in the Concentration of Dissolved Oxygen and Free Carbon Dioxide in a Laboratory Channel,
W73-11011 5C

ROAD CONSTRUCTION
Guidelines for Hydraulic Considerations in Highway Planning and Location.
W73-10657 8B

Guidelines for Hydrology.
W73-10658 8B

ROAD DESIGN
Guidelines for Hydraulic Considerations in Highway Planning and Location.
W73-10657 8B

Guidelines for Hydrology.
W73-10658 8B

ROCK MECHANICS
Air Blast Drilling with Rotary Rock Bits,
W73-10797 8C

ROCKY MOUNTAIN REGION
Field Experiments on Freezing and Thawing at 3.350 Meters in the Rocky Mountains of Colorado, U.S.A.,
W73-10976 2C

ROMANIA
Resistance to Drought of Some Corn Single Hybrids Developed at the ICCPT-Fundulea and of Their Component Lines, (In Rumanian),
W73-10864 3F

ROOT DEVELOPMENT
The Effect of Root Geometry on the Yield of Wheat Growing on Stored Water,
W73-10701 3F

ROOT SYSTEM
On the Geotropic Growth of the Root, (In German),
W73-10632 2I

ROSTHERNE BROOK
The Effects of Pollution on Gammarus Pulex (L) Subsp, Pulex (Schellenberg) in the Inlet Streams of Rostherne Mere, Cheshire,
W73-11047 5C

ROTARY DRILLING
Surface-Hole Techniques Should be Simple and Cheap,
W73-10706 8A

Efficiency of Various Methods of Drilling Wells for Water Supply,
W73-10789 8A

Lowest Cost-Per-Foot is Aim of Own Calculations,
W73-10791 8G

ROTATING DISK ELECTRODE
Measurement of Current and Potential Distribution at Rotating-Disk Electrodes,
W73-10498 7B

ROUTING
Effects of Time Step Size in Implicit Dynamic Routing,
W73-10676 2E

RUNOFF
Runoff Characteristics of California Streams,
W73-10447 2E

Water Balance in Soviet Central Asisa (Vodnyy balans territorii Sredney Azii).
W73-10448 2A

Water Balance and Runoff Losses in the Fergana Valley and Golodnaya Steppe (Struktura vodnogo balansa i poteri rechnogo stoka v Ferganskoy doline i Golodnoy stepi),
W73-10456 2A

Color It Evaporation,
W73-10829 2D

RUNOFF FORECASTING
Snow Studies Using Thermal Infrared Measurements from Earth Satellites,
W73-10435 2C

RURAL AREAS
Local Economic Impact of Reservoir Recreation,
W73-10415 6B

RYBINSK RESERVOIR (USSR)
Biological Productivity of the Rybinsk Reservoir,
W73-10914 5C

SAANICH INLET (B C)
Deep Water Renewal in Saanich Inlet, an Intermittently Anoxic Basin,
W73-10432 5B

SABINE RIVER BASIN (TEX AND LA)
A Network for Continuous Monitoring of Water Quality in the Sabine River Basin, Texas and Louisiana,
W73-10683 5A

SALINE LAKES
Diatoms in Alkaline, Saline Lakes: Ecology and Geochemical Implications,
W73-10545 5C

The Uniqueness of Salt Lake Ecosystems,
W73-10907 5C

SALINE SOILS
Effect of Depth and Quality of Ground Water on Soil Salinization: A Field Study with a Fluctuating Water Table,
W73-10441 2G

SALINE WATER
Chloride Balance of Some Farmed and Forested Catchments in Southwestern Australia,
W73-10669 2K

Saline and Organic Water Pollution,
W73-10833 3C

SALINE WATER INTRUSION
Mathematical Simulation of Tidal Time-Averages of Salinity and Velocity Profiles in Estuaries,
W73-10436 2L

SALINITY
Effect of Depth and Quality of Ground Water on Soil Salinization: A Field Study with a Fluctuating Water Table,
W73-10441 2G

Suspended Sediments in Continental Shelf Waters off Cape Hatteras, North Carolina,
W73-10758 2J

SALINIZATION HAZARD
Salinity Problems of Impoundments and Their Management,
W73-10734 5G

SALMONELLA
Salmonellae and Edwardsiella Tarda in Gull Feces: A Source of Contamination in Fish Processing Plants,
W73-10463 5B

SALMONELLA SPP
Simultaneous Quantitation of Salmonella Species and Pseudomonas Aeruginosa. I. Polluted Waters. II. Persistence of Pathogens in Sludge Treated Soils. III. Analysis of Waste Treatment

Sludges for Salmonella Species as a Surveillance Tool,
W73-10549 5B

SALMONELLA TYPHIMURIUM LT2
Radiation-Resistant Mutants of Salmonella typhimurium LT2: Development and Characterization,
W73-11029 5B

SALT BALANCE
Chloride Balance of Some Farmed and Forested Catchments in Southwestern Australia,
W73-10669 2K

SALT MARSHES
Effects of Mosquito Control Ditching on Estuarine Ecosystems,
W73-10410 5G

A Comparison of Microarthropod Populations in Sewage-Exposed and Sewage-Free Spartina Salt Marshes,
W73-10814 5C

SALTCEDAR
Woody Phreatophytes Along the Brazos River and Selected Tributaries Above Possum Kingdom Lake,
W73-10745 3B

SALTS
Underground Corrosion and Salt Infiltration,
W73-10712 4C

Exchange of Nutrients Salts Through the Kerch Strait (Obmen pitatel'nymi solyami cherez Kerchenskiy Proliv),
W73-10781 2K

SALVINIA MINIMA
Growth of a Floating Aquatic Weed, Salvinia Under Standard Conditions,
W73-11007 5C

SALVINIA MOLESTA
Growth of a Floating Aquatic Weed, Salvinia Under Standard Conditions,
W73-11007 5C

SAMPLE PREPARATION
Two Instruments for Activation Analysis of Solutions by a Dilution Method,
W73-10509 7B

A Rapid, Inexpensive Coulometric Determination of Sulphur in Petroleum Products,
W73-10510 5A

Detection of Organo-Phosphorus Pesticide Residues in Autopsy Tissues by Thin-Layer Chromatography,
W73-11023 5A

Separation and Characterization of Dimethylnitrobiphenyl and Dimethylbiphenylamine Isomers by Chromatographic and Spectrometric Methods,
W73-11032 5A

Trace Element Analysis in Water by Proton Activation,
W73-11033 5A

Spectrophotometric Determination of Sulfate Ion with Barium Iodate and the Linear Starch Iodine System,
W73-11045 5A

SAMPLE PRESERVATION
On the Storage of Seawater Samples for Ammonia Determination,
W73-10518 5A

A Field Fixation Technique for Dissolved Phosphate in Lake Water,
W73-10519 5C

SAMPLE SIZE DETERMINATION
Optimum Sample Sizes for the Comparison of the Control and Treatment,
W73-10503 7B

SAMPLE STORAGE
A Field Fixation Technique for Dissolved Phosphate in Lake Water,
W73-10519 5C

SAMPLING
Modifications of the Birge-Ekman Box Corer for Use with Scuba or Deep Submergence Research Vessels,
W73-10486 7B

Contamination of Surfaces by Bacterial Neuston,
W73-10488 5A

A Solution to Small Sample Bias in Flood Estimation,
W73-10840 2E

At-Stream-Velocity Pumping Sediment Sampling System,
W73-10992 2J

SAN ANTONIO (TEXAS)
An Economic Evaluation of a Water-Based Urban Tourist Attraction in San Antonio, Texas,
W73-10564 6B

SAN FERNANDO EARTHQUAKE
The San Fernando Earthquake: A Lesson In Highway and Bridge Design,
W73-10612 8A

SAND WAVES
Migration of Tidal Sand Waves in Chesapeake Bay Entrance,
W73-10765 2J

SANTA BARBARA OIL SPILL
Biology of Sea Mussels (Mytilus Californianus (Conrad) and M. Edulis (Linn.)) Before and After the Santa Barbara Oil Spill (1969),
W73-10866 5C

SANTA CLARA VALLEY (CALIFORNIA)
Electromagnetic Depth Sounding Experiment Across Santa Clara Valley,
W73-10720 4B

SARGASSO SEA
Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-10490 5B

SATELLITES (ARTIFICIAL)
Test Results of Six-Month Test of Two Water Electrolysis Systems,
W73-10685 2K

60 GHz Radiometric Local Vertical Sensor Experiment,
W73-10743 7B

SAURY (SPAWNING)
Distribution of the Spawning Portion of the Saury Population Cololabis satra (Brev.) in the Pacific Ocean and Sea of Japan in Relation to the Temperature of the surface Water Layer, (In Russian),
W73-10521 2I

SCALE STRUCTURE (FISH)
Scale Structure of the Amur Keta Oncorhynchus Keta (Walb.) as an Index of Growth and Living Conditions During the Freshwater Stage of Life, (In Russian),
W73-10642 2I

SCENDESUMUS
Competition Between an Alga and an Aquatic Bacterium for Phosphate,
W73-10894 5C

SCENEDESMUS OBLIQUUS
The Effect of Calcium on Growth and Morphogenesis of Chlorella, Golenkinia, and Scenedesmus,
W73-10540 5C

SCENEDESMUS QUADRICAUDA
Enteric Virus Survival in Algal-Bacterial Wastewater Treatment Systems-I. Laboratory Studies,
W73-11010 5D

SCENIC HIGHWAYS
An Investigation of Colorado River Trips: A User Study,
W73-10819 6G

SCUBA DIVING
Modifications of the Birge-Ekman Box Corer for Use with Scuba or Deep Submergence Research Vessels,
W73-10486 7B

SCUDS
Toxicity, Residue Dynamics, and Reproductive Effects of Phthalate Esters in Aquatic Invertebrates,
W73-11020 5C

SEA ICE
Structure of a Multi-Year Pressure Ridge,
W73-10974 2C

SEA OF AZOV
Collection of Papers of the Hydrometeorological Observatory of the Black Sea and Sea of Azov Basins (Sbornik rabot Basseynovoy gidrometeorologicheskoy observatorii Chernogo i Azovskogo morey).
W73-10779 2K

Dynamics of Mineral and Organic Phosphorus in the Sea of Azov After, Regulation of Don River Flow (Dinamika mineral'nogo i organicheskogo fosfora v Azovskom more posle zaregulirovaniya stoka reki Dona),
W73-10782 2K

SEA OF JAPAN
Distribution of the Spawning Portion of the Saury Population Cololabis satra (Brev.) in the Pacific Ocean and Sea of Japan in Relation to the Temperature of the surface Water Layer, (In Russian),
W73-10521 2I

SEA WATER
Marina Del Rey: A Study of Environmental Variables in a Semi-Enclosed Coastal Water,
W73-10465 5B

Adsorption of Chlorinated Hydrocarbons from Seawater by a Crosslinked Polymer,
W73-10490 5B

SEA WATER

Characteristics of the Nearshore Environment off the South Coast of Anvers Island, Antarctic Peninsula,
W73-10520 5A

Inorganic Phosphorus in Seawater,
W73-10680 2K

Collection of Papers of the Hydrometeorological Observatory of the Black Sea and Sea of Azov Basins (Sbornik rabot Basseynovoy gidrometeorologicheskoy observatorii Chernogo i Azovskogo morey).
W73-10779 2K

Dynamics of Silicon in the Black Sea as Observed Along the Cape Khersones-Bosporus Profile (Dinamika kremniya v Chernom more po materialam nablyudeniy na razrezemys Khersones--proliv Bosfor),
W73-10780 2K

Exchange of Nutrients Salts Through the Kerch Strait (Obmen pitatel'nymi solyami cherez Kerchenskiy Proliv),
W73-10781 2K

Dynamics of Mineral and Organic Phosphorus in the Sea of Azov After, Regulation of Don River Flow (Dinamika mineral'nogo i organicheskogo fosfora v Azovskom more posle zaregulirovaniya stoka reki Dona),
W73-10782 2K

Occurrence of some Chlorinated Aliphatic Hydrocarbons in the Environment,
W73-10850 5B

Heavy Metals in British Waters,
W73-10851 5B

Halogenated Hydrocarbons in and Over the Atlantic,
W73-10873 5B

SEAFOOD

Vibrio Parahaemolyticus Methodology for Isolation from Seafoods and Epidemic Specimens,
W73-10874 5A

SEALANTS

Investigation of use of Gel Material for Mine Sealing,
W73-10880 5G

SEASONAL

Seasonal Dynamics of Biological Indices of Roach Rutilus Rutilus (L.) with Different Food Supplies, (In Russian),
W73-10484 2I

Seasonal Fluctuations of Ionic Copper in Knights Pond, Massachusetts,
W73-10487 5B

Seasonal Changes of the Number of Nitrogen Cycle Bacteria in Bottom Sediments of a Pool,
W73-10641 5C

Seasonal Fluctuations in the Water Content of Various Plant Formations in Haute-Ardenne,
W73-10643 2I

The Seasonal Variation of Some Ecological Efficiencies and Production Rates in the Plankton Community of Several Polish Lakes of Different Trophy,
W73-10897 5C

SEAWATER

On the Storage of Seawater Samples for Ammonia Determination,
W73-10518 5A

Delaware Marine Related Study,
W73-10574 5G

SECONDARY PRODUCTIVITY

An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

The Production Processes in Several Polish Lakes,
W73-10898 5C

SEDIMENT CONTROL

Coastal Erosion in the Nile Delta,
W73-10681 2J

Sedimentation Studies of Bhakra Reservoir,
W73-10998 2J

SEDIMENT LOAD

Sediment Transport by Streams Draining into the Delaware Estuary,
W73-10425 2L

SEDIMENT SORTING

The Significance of Wave Parameters In the Sorting of Beach Pebbles,
W73-10431 2J

SEDIMENT SOURCES

Sources and Sinks of Suspended Matter on Continental Shelves,
W73-10757 2J

SEDIMENT TRANSPORT

Reconnaissance of Chemical Quality of Surface Water and Fluvial Sediment in the Price River Basin, Utah,
W73-10423 2K

Sediment Transport by Streams Draining into the Delaware Estuary,

STAPHYLOCOCCUS AUREUS
Phage-Typing of Staphylococcus aureus,
W73-11012 5A

STAPHYLOCOCCUS EPIDERMIDIS
Ultrastructure of Staphylococcus epidermidis after Freeze-Etching and Thin Sectioning,
W73-10500 5A

STATE GOVERNMENTS
Proceedings of the 1971 OSTAC Annual Meeting, State Department, Washington, D.C. 2-3 June 1971.
W73-10570 5G

Conceptual System Design for an Environmental Information Base for Management of Water and Related Resources by States,
W73-10725 10A

STATISTICAL METHODS
An Analysis of Factors Governing Productivity in Lakes and Reservoirs,
W73-10475 5C

Optimum Sample Sizes for the Comparison of the Control and Treatment,
W73-10503 7B

A Method for Computing Regression Coefficients Utilizing Incomplete Observations,
W73-10533 7B

Factorial Experiments in Concrete Research,
W73-10609 8F

Mass Balance and Spectral Analysis Applied to Karst Hydrologic Networks,
W73-10661 2F

Role of Modern Methods of Data Analysis for Interpretation of Hydrologic Data in Arizona,
W73-10839 6B

Objective and Subjective Analysis of Transition Probabilities of Monthly Flow on an Ephemeral Stream,
W73-10843 2E

Information Content of Time-Variant Data,
W73-10969 7C

A Test of Equality of Means of Correlated Variates With Missing Data on One Response,
W73-11013 7C

An Estimator For the Size of an Animal Population,
W73-11017 7C

STATISTICAL MODELS
Stochastic Models Applied to Operation of Reservoirs in the Upper Colorado River Basin in Texas,
W73-10565 2A

Shelf Sediment Transport: A Probability Model,
W73-10755 2J

STOCHASTIC PROCESSES
Input Specifications to a Stochastic Decision Model,
W73-10838 4A

STOCKBRIDGE BOWL (MASS)
The Limnology of Stockbridge Bowl, Stockbridge, Massachusetts,
W73-10561 5C

STOICHIOMETRIC MODELS
Processes Affecting the Oceanic Distribution of Carbon Dioxide,
W73-10534 5B

STOKES LAW
A Finite Element Solution for Two-Dimensional Density Stratified Flow,
W73-10418 2H

STORAGE
Frozen Prepared Microbiological Culture Media,
W73-10857 5A

STRATIFICATION
Stratification of Tropical Epiphylls,
W73-10645 2I

STRATIFIED FLOW
A Finite Element Solution for Two-Dimensional Density Stratified Flow,
W73-10418 2H

A Two-Layer Model of Mud Transport in the Thames Estuary,
W73-10443 2L

Effect of Bottom Topography, Eddy Diffusivity, and Wind Variation on Circulation in a Two-Layer Stratified Lake,
W73-10973 2H

STRATIGRAPHY
Nearshore Sedimentary Processes as Geologic Studies,
W73-10773 2J

STRAY CURRENT CORROSION
Practical Interference Current Testing on Underground Metallic Structures,
W73-10610 8G

STREAMFLOW
Converting Chaparral to Grass to Increase Streamflow,
W73-10831 3B

Significance of Antecedent Soil Moisture to a Semiarid Watershed Rainfall Runoff Relation,
W73-10841 2G

Bed Material Characteristics and Transmission Losses in an Ephemeral Stream,
W73-10845 2E

Reconnaissance of the Manistee River, A Coldwater River in the Northwestern Part of Michigan's Southern Peninsula,
W73-10985 7C

STREAMS
The Chalk-Stream Ecosystem,
W73-10921 5C

An Analysis of Stream Temperatures in Louisiana,
W73-10987 2G

STREPTOCOCCUS
Differentiation of Some Enterococci by Gas Chromatography,
W73-11027 5A

STREPTOMYCIN
A New, Sensitive Method For the Determination of Streptomycin,
W73-10514 5A

STRUCTURAL DESIGN
Suggested Design and Construction Procedures for Pier Foundations.
W73-10611 8F

STURGEON
Migration of Sturgeon (Acipenseridae) in the Volga During Winter, (In Russian),
W73-10614 2I

SUBLETTE COUNTY (WYO)
Hydraulic Testing and Sampling of Water Well Number 2, Project Wagon Wheel, Sublette County, Wyoming,
W73-10445 4B

SUBMERGED FLOW
Comparison of Bridge Backwater Relations,
W73-10990 2E

SUBSIDENCE
Subsidence Damage in Southern Arizona,
W73-10825 2F

SUBSTRATE MATERIALS
Nitrate Reduction in the Vicinity of Tile Drains,
W73-10560 5B

SUBSTRATE UTILIZATION
Effects of Iron on Activated Sludge Treatment,
W73-10512 5D

SUBSURFACE RUNOFF
The Interflow Process on Sloping Watershed Areas,
W73-10563 2G

SUBSURFACE WATER AVAILABILITY
Seismograph and Resistivity Use in Shallow Groundwater Search,
W73-10793 8G

SUBSYSTEM INTERRELATIONS
The Gulf Environmental Program,
W73-10575 5G

SUGAR BEETS
Overhead Irrigation of Sugar Beet on Silty Loam: The Effect of Sprinkling and N-Manuring on Yields and Essential Quality Factors, (In German),
W73-10810 3F

SULFATES
The Indirect Spectrophotometric Determination of the Sulphate Ion With 2-Aminoperimidine,
W73-10527 5A

SULFATES

Spectrophotometric Determination of Sulfate Ion with Barium Iodate and the Linear Starch Iodine System,
W73-11045 5A

SULFUR
A Rapid, Inexpensive Coulometric Determination of Sulphur in Petroleum Products,
W73-10510 5A

Selective Determination of Hetero-Organics by a Dual-Channel Detector Based on Flame Conductivity and Emission,
W73-11040 5A

SURF
The Significance of Wave Parameters In the Sorting of Beach Pebbles,
W73-10431 2J

Wave Boundary Layers and Their Relation to Sediment Transport,
W73-10748 2J

Predicting Initial Motion and Bedload Transport of Sediment Particles in the Shallow Marine Environment,
W73-10749 2J

Wave Estimates for Coastal Regions,
W73-10751 2J

SURFACE WATER
An Evaluation of Current Practices in Seepage Control,
W73-10828 4A

SURFACE WATERS
Guide to World Inventory of Sea, Lake and River Ice.
W73-10427 2C

Geohydrologic Reconnaissance and Study Plan for Water Resources Investigations in the Baroda-Broach Area, Gujarat, India,
W73-10439 4A

The Indirect Spectrophotometric Determination of the Sulphate Ion With 2-Aminoperimidine,
W73-10527 5A

Water-Temperature Data Acquisition Activities in the United States,
W73-10986 7C

SURFACES
Evaporation from Free-Water Surfaces in Soviet Central Asia (Ispareniye a vodnoy poverkhnosti v usloviyakh Sredney Azii),
W73-10454 2D

Filters With a Constant Moisture Potential at the Surface (Fil'try s postoyannym potentsialom vlagi na poverkhnosti),
W73-10774 2G

SURFACTANTS
Surfactants in Sewage and Their Possible Removal, (In Italian),
W73-10634 5D

SURGE TANKS
The Feasibility of Flow Smoothing Stations in Municipal Sewage Systems,
W73-10722 5D

SURVEYS
Field Evaluation and Design Considerations of Aerobic Digestion,
W73-10738 5D

Water Resources Investigations in North Dakota, 1972.
W73-10980 7C

SURVIVAL
Enteric Virus Survival in Algal-Bacterial Wastewater Treatment Systems-I. Laboratory Studies,
W73-11010 5D

SUSPENDED LOAD
Fate of Suspended Sediment During Basin Recharge,
W73-10668 2J

Sources and Sinks of Suspended Matter on Continental Shelves,
W73-10757 2J

Suspended Sediments in Continental Shelf Waters off Cape Hatteras, North Carolina,
W73-10758 2J

Mineralogy of Suspended Sediment off the Southeastern United States,
W73-10759 2J

Comments on the Dispersal of Suspended Sediment Across the Continental Shelves,
W73-10761 2J

Some Specific Problems in Understanding Bottom Sediment Distribution and Dispersal on the Continental Shelf,
W73-10762 2J

Implications of Sediment Dispersal From Bottom Current Measurements; Some Specific Problems in Understanding Bottom Sediment Distribution and Dispersal on the Continental Shelf--A Discussion of Two Papers,
W73-10763 2J

At-Stream-Velocity Pumping Sediment Sampling System,
W73-10992 2J

SUSPENDED SOLIDS
Determination of Nanogram Levels of Silver in Suspended Materials of Streams Retained by A Membrane Filter with the 'Sampling-Boat' Technique,
W73-10429 2K

SUSQUEHANNA RIVER BASIN
Establishing Priorities in Mine Drainage Reduction, A Cost-Effectiveness Approach,
W73-10624 5G

SWAMPS
Some Ecological Aspects of a Nesting Colony of Herons,
W73-10651 2H

SWEDEN
The Application of a Simple Rainfall-Runoff Model to a Catchment with Incomplete Data Coverage,
W73-10656 2A

SYNTHETIC HYDROLOGY
Stream Baseflow Prediction by Convolution of Antecedent Rainfall Effects,
W73-10675 2A

SYSTEMATICS
A New Species of Pseudocodium (Chlorophyta, Siphonales) from the West Coast of Florida,
W73-10470 5A

Freshwater Algae From the Itasca State Park Minnesota, IV. Cyanophta, Rhodophyta, Chloromonadophyceae, and Cryptophyceae,
W73-10544 5A

Desmids from Southeast United States of America, (Desmidieen aus dem Sudosten der Vereinigten Staaten von Amerika),
W73-10546 5A

Bibliography on the Ecology and Taxonomy of Marine Algae,
W73-10949 5C

Phage-Typing of Staphylococcus aureus,
W73-11012 5A

SYSTEMS ANALYSIS
Hydrology as a Science,
W73-10820 10A

Base for a Model of the Slapy Reservoir Ecosystem,
W73-10916 5C

TEA PLANTS
Water Regime of Sod-Brown Soils and Relation of Tea-Leaf Yield to Precipitation (Vodnyy rezhim dernovo-burozemnykh pochv i zavisimost' urozhaya chaynogo lista ot osadkov),
W73-10776 2G

TECHNOLOGY
International Co-operation for Pollution Control,
W73-10566 5G

TELEMETERY
An On-Site Hydrologic Data Recording System,
W73-10677 7B

TELEVISION (UNDERWATER)
Currents and Sediment Transport at the Wilmington Canyon Shelfbreak, as Observed by Underwater Television,
W73-10772 2J

TEMPERATURE COMPENSATED ELECTRODE
A Study to Improve Dissolved Oxygen Analysis Techniques to Facilitate Water Quality Field Survey Applications,
W73-10559 5A

TEMPERATURE CONTROL
Test Results of Six-Month Test of Two Water Electrolysis Systems,
W73-10685 2K

TEMPERATURE EFFECTS
Nitrate Reduction in the Vicinity of Tile Drains,
W73-10560 5B

TENDING TREATMENTS
Effects of Heavy Tending Treatments on the Microclimate in Young Crops of Spruce, (In Czech),
W73-10649 2I

TENNESSEE
Local Economic Impact of Reservoir Recreation,
W73-10415 6B

TEST WELLS
Hydraulic Testing and Sampling of Water Well Number 2, Project Wagon Wheel, Sublette County, Wyoming,
W73-10445 4B

Notes on Developing Ground Waters,
W73-10711 4B

TESTING
Influence of Water Quality in Maintaining Whiteness When Laundering White Fabrics,
W73-10420 5G

TESTING PROCEDURE
Primary Production of a Montane River,
W73-10923 5C

TESTING PROCEDURES
Comparison of Some Methods of Determining the Primary Production of Phytoplankton in Ponds,
W73-10929 5C

TEXAS
An Economic Evaluation of a Water-Based Urban Tourist Attraction in San Antonio, Texas,
W73-10564 6B

Stochastic Models Applied to Operation of Reservoirs in the Upper Colorado River Basin in Texas,
W73-10565 2A

A Predictive Model for Upper Rio-Grande Index Flows,
W73-10620 4A

Groundwater Resources of Coke County, Texas,
W73-10744 4B

Woody Phreatophytes Along the Brazos River and Selected Tributaries Above Possum Kingdom Lake,
W73-10745 3B

'Iron Water' from Wells: Causes and Prevention,
W73-10785 4B

Microbial Community Structure in Contaminated Estuarian Sediments,
W73-11025 5C

TEXTILES
Influence of Water Quality in Maintaining Whiteness When Laundering White Fabrics,
W73-10420 5G

THALASSIOSIRA PSEUDONANA
Geographic Differences in Phytoplankton Sensitivity to PCBS,
W73-10849 5C

THAMES ESTUARY (ENGLAND)
A Two-Layer Model of Mud Transport in the Thames Estuary,
W73-10443 2L

THAWING
Field Experiments on Freezing and Thawing at 3.350 Meters in the Rocky Mountains of Colorado, U.S.A.,
W73-10976 2C

THERMAL POLLUTION
The State of Marine Pollution in the Mediterranean and Legislative Controls.
W73-10553 5B

Precise Water Velocity Measurements Using Photogrammetric Techniques,
W73-10678 5B

THERMAL STRATIFICATION
Dissolved Oxygen and Temperature in a Stratified Lake,
W73-11005 5B

THERMOCLINE
Data on Selected Lakes in Washington, Part I,
W73-10654 2H

THERMOPLASTICS
Reinforced Thermoplastics and Thermosets for Corrosion Control: State of the Art,
W73-10708 8G

THIAMINE
The Fluorimetric Determination of Phosphate with Thiamine,
W73-10529 5A

THIN LAYER CHROMATOGRAPHY
Comparative Studies of Thin Layer Chromatographic Systems for the Separation and Identification of Photoalteration Products of Parathion,
W73-10493 5A

Residues of MS-222 in Northern Pike, Muskellunge, and Walleye,
W73-10496 5A

Detection of Organo-Phosphorus Pesticide Residues in Autopsy Tissues by Thin-Layer Chromatography,
W73-11023 5A

THIN LAYER CHROMATOGRAPHY (REVERSE PHASE)
Reverse Phase Thin Layer Chromatography of Some Aroclors, Halowaxes, and Pesticides,
W73-10492 5A

THROUGHFALL
Influence of Vegetation and Substrate on Streamwater Chemistry in Northern Utah,
W73-10413 5B

THUNDERSTORMS
Weather Modification in Arizona, 1971,
W73-10832 3B

Bed Material Characteristics and Transmission Losses in an Ephemeral Stream,
W73-10845 2E

TIDAL EFFECTS
Mathematical Simulation of Tidal Time-Averages of Salinity and Velocity Profiles in Estuaries,
W73-10436 2L

Tidal Currents and Zig-Zag Sand Shoals in a Wide Estuary Entrance,
W73-10982 2L

TIDAL MARSHES
Beneficial Aquatic Plants in Coastal Areas,
W73-10955 3B

TIDES
Tidal Current Asymmetries over the Norfolk Sandbanks,
W73-10430 2E

TILE DRAINS
Nitrate Reduction in the Vicinity of Tile Drains,
W73-10560 5B

TILLERING NODES
Additional Water-Retaining Forces of Hardened Tillering Nodes of Winter Wheat During Their Drying and Freezing, (In Russian),
W73-10704 3F

TIME OF CONCENTRATION
Effective Mixing in Shallow Bodies of Water with and without Density Stratification,
W73-10719 5D

TIOGA RIVER (PA)
Establishing Priorities in Mine Drainage Reduction, A Cost-Effectiveness Approach,
W73-10624 5G

TISSUE
Analysis of Soluble Beryllium By Gas Chromatography,
W73-10497 5A

Distribution of Vibrio Parahaemolyticus in the Natural Environment,
W73-10875 5B

TOPOGRAPHIC MAPPING
Side-Look Radar Provides a New Tool for Topographic and Geological Surveys,
W73-10615 7B

TOXICITY
Geographic Differences in Phytoplankton Sensitivity to PCBS,
W73-10849 5C

Toxic Effects of Mercury on the Activated Sludge Process,
W73-11026 5C

TRACE ELEMENTS
Determination of Nanogram Levels of Silver in Suspended Materials of Streams Retained by A Membrane Filter with the 'Sampling-Boat' Technique,
W73-10429 2K

The Determination of Vandium in Brines by Atomic Absorption Spectroscopy,
W73-10442 5A

The Direct Determination of Chromium in Urine by Selective Volatilization with Atom Reservoir Atomic Absorption,
W73-10525 5A

Trace Element Analyses of Columbia River Water and Phytoplankton,
W73-10806 5A

A Simple Modification of a Flame Photometer for Routine Trace Potassium Analysis,
W73-10852 5A

New Methods for the Determination of Elements in Trace Amounts,
W73-10862 5A

Trace Metals in Cores from the Great Marsh, Lewes, Delaware.
W73-10971 2J

Some Trace Element Concentration Variations Observed in Marine Organisms that Suggest Caution in Sampling,
W73-11021 5A

The Determination of Trace Metals and Their Significance in Clinical Chemistry,
W73-11030 5A

Trace Element Determination with Semiconductor Detector X-Ray Spectrometers,
W73-11031 5A

Trace Element Analysis in Water by Proton Activation,
W73-11033 5A

TRACE ELEMENTS

The Application of Flameless Atomic Absorption in Hydrogenochemical Analysis,
W73-11039 2K

TRACE LEVELS

The Fluorimetric Determination of Phosphate with Thiamine,
W73-10529 5A

Rapid Determination of Very Low Nitrogen Levels in Water,
W73-10853 5A

New Methods for the Determination of Elements in Trace Amounts,
W73-10862 5A

TRACERS

The Hydraulics of Waste Stabilization Ponds, Part I. The Effect of Hydraulic Flow Characteristics on Treatment Efficiency, Part II. The Effect of Wind on mixing in stratified and unstratified ponds.
W73-10414 5D

Tracer Simulation Study of Potential Solute Movement in Port Royal Sound, South Carolina,
W73-10446 5B

Accumulation of Fallout Cesium 137 in Soils and Sediments in Selected Watersheds,
W73-10667 5B

Effective Mixing in Shallow Bodies of Water with and without Density Stratification,
W73-10719 5D

TRACKING TECHNIQUES

Tracing Oil as a Pollutant in Water,
W73-11024 5A

TRAINING

Water and Related Land Resources Training Needs Study, Comprehensive Planning for Water and Related Land Resources in Alabama,
W73-10695 9A

TRANCE ELEMENTS

Trace Element Analysis by Proton-Induced X-Ray Excitation,
W73-10508 5A

TRANSMISSION TOWERS

Loading and Design of Transmission Towers,
W73-10616 8C

TRANSMISSIVITY

Transmissivity Distribution in the Tucson Basin Aquifer,
W73-10827 2F

TRANSPARENCY

Observations on the Transparency of the Waters of the Pulicat Lake with Particular Reference to Plankton Production,
W73-11046 5C

TRANSPIRATION

Analysis of Water Consumption of Various Grape Cultivars,
W73-10440 2D

TREATMENT

Effect of a Grass and Soil Filter on Tucson Urban Runoff: A Preliminary Evaluation,
W73-10835 5D

TREATMENT FACILITIES

Application of Selected Industrial Engineering Techniques to Waste Water Treatment Plants,
W73-10723 5D

TRIANGLE LAKE (ORE)

Dissolved Oxygen and Temperature in a Stratified Lake,
W73-11005 5B

TRICKLING FILTERS

A Study of Ciliate Protozoa From a Small Polluted Stream in East-Central Illinois,
W73-10886 5D

TROPHIC LEVEL

The Seasonal Variation of Some Ecological Efficiencies and Production Rates in the Plankton Community of Several Polish Lakes of Different Trophy,
W73-10897 5C

Biological Productivity of Different Types of Lakes,
W73-10909 5C

Trophic Structure of Lake Tatsu-Numa, An Acidotrophic Lake in Japan, With Special Reference to the Importance of the Terrestrial Community,
W73-10910 5C

Results of the Study of Some Links of the Food Chain in a Carp Pond in Czechoslovakia,
W73-10917 5C

Productivity and Energy Flow at all Trophic Levels in the River Thames, England,
W73-10920 5C

Edaphic Factors Override A Possible Gradient of Ecological Maturity Indices in a Small Stream,
W73-11003 5A

TROPICAL REGIONS

Lake George, Uganda. Studies on a Tropical Freshwater Ecosystem.
W73-10905 5C

TUCSON

Technical, Economic and Legal Aspects Involved in the Exchange of Sewage Effluent for Irrigation Water for Municipal use, Case Study - City of Tucson,
W73-10402 5D

TURBIDITY

The Origin, Effects and Control of Turbidity in an Urban Recreational Lake,
W73-10406 5B

TURBULENT FLOW

Nonlinear Stability of Plane Poiseuille Flow of Viscoelastic Liquids,
W73-10428 2E

TURF GRASSES

Evaluation of a Turfgrass-Soil System to Utilize and Purify Municipal Waste Water,
W73-10837 5D

TWO-DIMENSIONAL FLOW

A Finite Element Solution for Two-Dimensional Density Stratified Flow,
W73-10418 2H

TWO-SAMPLE PROCEDURE

A Two-Sample Procedure for Selecting the Population with the Largest Mean From Several Normal Populations with Unknown Variances,
W73-11014 7C

U.S. GEOLOGICAL SURVEY

The Water Resources Programs of the U.S. Geological Survey,
W73-10674 2E

ULTRASONICS

Development of an Oil/Water Pollution Monitor,
W73-10491 5A

ULTRASTRUCTURE

Ultrastructure of Staphylococcus epidermidis after Freeze-Etching and Thin Sectioning,
W73-10500 5A

ULTRAVIOLET RADIATION

Multi-Sensor Detection and Tracking of Controlled Oil Spills,
W73-10467 5B

Separation and Characterization of Dimethylnitrobiphenyl and Dimethylbiphenylamine Isomers by Chromatographic and Spectrometric Methods,
W73-11032 5A

ULVA LACTUCA

The Effect of Nutrient Fertilization on the Benthic Alga Ulva Lactuca,
W73-10944 5C

UNCONSOLIDATED AQUIFERS

Well Development of Sand and Gravel Aquifers,
W73-10798 8A

UNDERGROUND POWERPLANTS

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Design and construction of hydraulic structures; weather modification; and evaporation control at the Bureau of Reclamation, Denver, Colorado.
- Eutrophication at the Water Resources Center of the University of Wisconsin, jointly sponsored by the Soap and Detergent Association and the Agricultural Research Service.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Public water supply treatment technology at the American Water Works Association.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Thermal pollution at the Department of Sanitary and Water Resources Engineering of Vanderbilt University.
- Water quality requirements for freshwater and marine organisms at the College of Fisheries of the University of Washington.
- Wastewater treatment and management at the Center for Research in Water Resources of the University of Texas.
- Methods for chemical and biological identification and measurement of pollutants at the Analytical Quality Control Laboratory of the Environmental Protection Agency.
- Coastal pollution at the Oceanic Research Institute.
- Water treatment plant waste pollution control at American Water Works Association.
- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 6, NUMBER 18
SEPTEMBER 15, 1973

W73-11051 -- W73-11700

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Resources Research, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription is $45 (domestic), $56.25 (foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

SPECIAL NOTICE - PRICE INCREASE

Demand Order for Microfiche

Because of the high cost of handling individual requests for microfiche, we have found it necessary to raise the price for this service. Effective August 16, 1973, the price for a report in microfiche will be raised from 95¢ to $1.45 for domestic orders and from $2.45 to $2.95 for foreign orders, unless announced at a higher price. Microfiche announced at a price higher than $1.45 will continue to be sold at the announced price. The $1.50 added charge for foreign orders continues to apply. Deposit Account holders will be charged the increased price automatically. The price charged will be reflected on the monthly statement.

SELECTED
WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Resources Research, U.S. Department of the Interior

SMITHSONIAN - LIBRARY

VOLUME 6, NUMBER 18
SEPTEMBER 15, 1973

W73-11051 — W73-11700

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has basic responsibilities for water, fish, wildlife, mineral, land, park, and recreational resources. Indian and Territorial affairs are other major concerns of America's "Department of Natural Resources."

The Department works to assure the wisest choice in managing all our resources so each will make its full contribution to a better United States—now and in the future.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Resources Research and other Federal water resources agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

SALT AND NONELECTROLYTE INTERACTIONS IN WATER,
Pittsburgh Univ., Pa.
E. M. Arnett.
Available from the National Technical Information Service as PB-218 548, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 836, October 1972. 60 p, 22 fig, 32 tab. 14-30-2570.

Descriptors: *Solutes, *Enthalpy, *Entropy, Thermodynamics, Aqueous solutions, Salts.
Identifiers: *Nonelectrolytes, Salting-out, Nuclear magnetic resonance.

The interaction of nonelectrolytes with water and aqueous salt solutions has been investigated by several methods and several systems. Complete thermodynamics (delta G, delta H, delta S) of salting-out and salting-in have been investigated for a number of nonelectrolytes in aqueous salt solutions. The results constitute the only such systematic study of salting enthalpies and entropies. Conversely, the interaction of sodium chloride and some other salts with water-glycerol acetate binaries has been probed by thermodynamics and 23Na nmr. The relation of these results to interactions of cellulose acetate with salt water are considered. The behavior of the highly aqueous systems described here appears to be singular and is undoubtedly related to the unique ability of cool water to form extended three dimensional structured systems. CHEMICAL CYCLES WITH ENERGY CIRCUIT MODELS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
H. T. Odum.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 223-259, 1972. 27 fig, 1 tab, 35 ref. AEC Contract AT-(40-1)-4150.

Descriptors: *Model studies, *Geochemistry, *Sea water, *Ecosystems, Water chemistry, Mathematical models, Analog models, Chemical reactions, Ecology, Environmental effects.
Identifiers: *Energy circuit models.

An understanding of the large and complex systems of cycles of the earth, the seas, and man requires the simplification that comes with making models. Among the modeling and modular languages being developed for synthesis of macrosystems, an energy language may be used to consider the chemical cycles that sustain the sea. The language is a formalization of concepts of energy flow in which pathways represent either the energy flow driven by single forces or those driven by populations of forces. Each driven flow has opposing forces of frictional, inertial, or static nature, the latter derived from downstream storages of potential energy. Since the pathways represent all energy flows, and since theorems of the language allow all flows of matter and information to have their energy values at their points of action in the system, a common denominator is provided for all parts of all kinds of systems. The energy circuit language may be helpful in organizing understanding and hypotheses about which flows are linear, which are multiplicative actions, which are important, and which receive outside forcing energies. By diagramming subsystems and subcycles, it is possible to focus on various ideas about the origin, stability, and changes in the sea as related to man and other changing patterns. Identifiers: *USSR, *International Association of Scientific Hydrology (IASH).

The 15th General Assembly of the International Union of Geodesy and Geophysics was held in Moscow, July 30-August 14, 1971. Of the approximately 40 symposia arranged, several were under the direction of the International Association of Scientific Hydrology (IASH), now known as the International Association of Hydrological Sciences. These symposia included: water and air pollution (including 15 papers devoted to water-quality control and 20 papers to groundwater contamination); mathematical models in geophysics (19 papers); snow and ice in mountainous areas (57 papers); and water balance in semienclosed bodies of water (9 papers). The program of IASH activities for 1971-75 included symposia on statistical methods in hydrology (United States, 1972); hydrology of lakes (Finland, 1973); solution of hydrologic problems in the absence of sufficient data (Spain, 1973); artificial recharge of groundwater (United States, 1973); problems of snow mechanics (Switzerland, 1973); water balance (France, 1974); influence of man on water balance and the hydrologic regime (France, 1974); interaction of surface waters and groundwater (France, 1974); mathematical modeling of water-resources systems (German Democratic Republic, 1975); and distribution of snow in connection with surface roughness (France, 1975). Noxious Brush and Weed Control Research Highlights-1972, Vol 3, p 16-17, 1972. 2 photo. OWRR C-3191 (No 3699) (1).

Descriptors: *Water yield, *Sediment yield, *Small watersheds, *Burning, Soil erosion, Runoff, Demonstration watersheds, Slopes, Vegetation effects, Rainfall-runoff relationships.

Water yield, sedimentation, and water quality were measured following a burn and were related to various degrees of cover and slope. During the study, 12 watersheds were selected and fenced. Four of the watersheds were on level areas (2.7 to 3.7%), four were on moderate slopes (7.8 to 20.1%), and four were on steep slopes (37.3 to 60.6%). One watershed of each degree of slope was burned without any prepared firelines. The moderate slope produced more runoff than the control only after a very intense storm of 2.18 inches/hr. The steep watershed (slope 52.8%) that had been burned produced from 887 to 34,765 gal/acre for storms that ranged in intensity from 0.10 to 2.18 inches/hr. Burning did not cause a significant release of sediment on the level areas, and only the most intense storm caused sediment to move on the moderate slope. However, a slow in-

tensity storm, an intense storm, and a moderately intense storm all caused significant soil movement on the steep watershed that had been burned. Degree of slope appears to account for most of the variation between watersheds. Burning increases calcium two to eight times and doubles the amount of magnesium. Turbidity of water was unchanged on the level areas, slightly increased on the moderate slopes, and increased as high as 2.9 ppm on the burned steep slope compared to 1.0 on the steep control. WATER RESOURCES INVENTORY OF CONNECTICUT: PART 6. UPPER HOUSATONIC RIVER BASIN,
Geological Survey, Hartford, Conn.
M. A. Cervione, Jr., D. L. Mazzaferro, and R. L. Melvin.
Connecticut Water Resources Bulletin No 21, 1972. 84 p, 50 fig, 4 plate, 27 tab, 108 ref.

Descriptors: *Water resources, *Surface waters, *Groundwater, *Water quality, *Connecticut, Precipitation (Atmospheric), Streamflow, Runoff, Water wells, Aquifers, Water yield, Chemical analysis, Sediment transport, Hydrologic data, Basic data collections, Maps, Curves.
Identifiers: *Upper Housatonic River basin (Conn).

The upper Housatonic River basin report area in Connecticut has an abundant supply of water of generally good quality, which is derived from precipitation. Annual precipitation has averaged about 46 inches over a 30-year period. Of this, approximately 22 inches of water is returned to the atmosphere each year by evaporation and transpiration. For the 30-year period 1931 through 1960, the annual runoff from precipitation averaged 24 inches (294 billion gallons). During the same period, inflows from Massachusetts and New York have averaged 220 and 64 billion gallons per year, respectively. A total average annual runoff of 578 billion gallons is therefore available. Stratified-drift aquifers are the only ones generally capable of yielding more than 100 gpm to individual wells. Drilled, screened wells tapping this unit yield from 17 to 1,400 gpm, with a median yield of 200 gpm. About 37% of the wells sampled yielded water with more than 200 mg/liter dissolved solids, and 50% yielded water with more than 120 mg/liter hardness. The quantity of suspended sediment transported by streams under natural conditions is negligible. (Woodard-USGS)
W73-11555

CLIMATE CHANGE AND THE INFLUENCE OF MAN'S ACTIVITIES ON THE GLOBAL ENVIRONMENT,
National Center for Atmospheric Research, Boulder, Colo.
W. W. Kellogg.
Available from NTIS Springfield, Va., 22151 as PB-213 676, Price $3.75 printed copy; $0.95 microfiche. Paper presented at Symposium on Energy, Resources and the Environment, July 11, 1972, Kyoto, Japan: Mitre Corporation Document M72-166, September 1972. 23 p, 7 fig.

Descriptors: *Climatology, *Climates, *Weather modification, *Environment, Sea ice, Carbon dioxide, Weather, Temperature, Heat balance, Albedo, Irrigation.
Identifiers: *Climatic change.

The history of changes in the earth's climate are traced from the earliest times to the present as recorded in the rocks and ice caps. Man's potential impact on the climate is discussed including the impact of carbon dioxide, particulate matters, 'albedo' changes, irrigation, and the direct release of heat. The results of man's activities are uncertain at this moment, but some preliminary computer calculations indicate that man can influence the climate of the earth, and that the direction of this influence in the decade to come must be that of a warming essentially in the Northern Hemisphere. The Arctic Ocean pack ice represents an unstable part of the ocean-atmosphere system in that a warming that would remove the pack ice would produce a major one-way transition. The impacts of such a transition would be very grave for some regions of the earth, but cannot be spelled out to become a disaster for mankind. (Knapp-USGS)
W73-11562

ELECTRICAL-ANALOG MODEL STUDY OF A HYDROLOGIC SYSTEM IN SOUTHEAST FLORIDA,
Geological Survey, Tallahassee, Fla.
C. A. Appel.
Geological Survey Open-file report 73004, 1973. 51 p, 14 fig, 29 ref.

Descriptors: *Hydrologic systems, *Surface-groundwater relationships, *Aquifer characteristics, *Canals, *Analog models, *Florida, Hydrologic data, Correlation analysis, Aquifers, Water level fluctuations, Pumping, Groundwater recharge, Hydrogeology.

The hydrologic system of southeast Florida consists of the Biscayne aquifer, a system of levees and canals, and related water-control facilities. Because the canals cut into the highly permeable aquifer, the aquifer and canals form a hydraulically connected system. Thus, manipulation of water levels in a canal influences levels in the aquifer and conversely, pumping from the aquifer affects conditions in nearby canals. An electrical analog model of the hydrologic system was developed for estimating the transitory response of naturally occurring as well as man-induced stresses on the hydrologic system. Factors considered in constructing the analog model and analysis of results are described. A summary is presented of a model application to determine the quantity of water needed to maintain canals at specified stages in the southern part of Dade County during dry periods. The comparison between observed and model-derived responses to stress applied to the aquifer during the 1962 test period indicate that the analog model is feasible and useful in the analysis of problems. (Woodard-USGS)
W73-11570

2B. Precipitation

A CATALOG OF HYDROCLIMATOLOGICAL DATA FOR ALASKA'S COASTAL ZONE,
Alaska University, College. Inst. of Water Resources.
R. F. Carlson, and G. Weller.
Available from the National Technical Information Service as PB-221 375, $5.00 in paper copy, $0.95 in microfiche. Alaska Institute of Water Resources Report No 25 (Sea Grant Report 72-2), May 1972. 56 p. OWRR A-999-ALAS (2).

Descriptors: *Hydrologic data, *Climatic data, *Coasts, *Alaska, *Publications, Information retrieval, Documentation, Bibliographies, Water resources development, Land development, Conservation, Ecology, Environment, Precipitation (Atmospheric), Ice, Snow.
Identifiers: Hydroclimatological catalog (Alaska coasts).

A complete understanding of Alaska's coastal water zone is important to resource development, conservation, and environmental concerns. This data catalog contains a listing of 192 hydroclimatological data sources of Alaska's coastal zone. Each source listing has three parts: an information citation, the nature of the data available, and the location for which all or part of the data is available. The information citation is comprised of six parts: the agency which compiled the data, the title of the source, the authors, the publication date of the source, the dates for which the data are applicable, and the library accession number of the source, which is the main University library, unless another is indicated. SPECTRA OF TURBULENT FLUCTUATIONS OVER OCEAN WAVES,
Naval Postgraduate School, Monterey, Calif.
G. S. Bingham.
Available from NTIS, Springfield, Va 22151 as AD-753 624, Price $3.00 printed copy; $0.95 microfiche. M Sc Thesis, September 1972. 62 p, 24 fig, 22 ref.

Descriptors: *Weather forecasting, *Air-water interfaces, *Oceans, *Ocean waves, *Waves (Water), Turbulence, Winds, Analytical techniques, Spectroscopy.
Identifiers: Spectral analysis, Wind-wave coupling, BOMEX, Sea-air interaction.

Several applied problems, especially long range atmospheric prediction, have created considerable interest in the contributory effects of the near surface boundary layer over the oceans. Significant progress occurred in 1969 with respect to observational studies as a result of the Barbados Oceanographic and Meteorological Experiment (BOMEX). Bomex took place in the Atlantic Ocean east-northeast of Barbados, West Indies. Spectral analyses were performed on turbulence data obtained over ocean waves during BOMEX. Results of seven selected periods were examined with respect to predictions in recent nonlinear and linear wind-wave coupling theories. Peaks in the velocity spectra occurred at the frequency of the wave spectra peaks (0.1 hz). At a frequency (0.26 hz) slightly higher than that of the wave spectrum peak the wind-wave phase relationship changes abruptly. This change occurred at a frequency where the wave phase speed was roughly two-thirds the mean wind speed at the level of measurement. At this same frequency the wind-wave correlation approached zero, and increased momentum transfer was observed. An examination of the amplitude ratio results confirmed the frequency of minimum wave induced disturbance to be at about 0.26 hz. (Woodard-USGS)

LARGE-SCALE AND LONG-TERM FLUCTUATIONS IN SOME ATMOSPHERIC AND OCEANIC VARIABLES,
National Weather Service, Silver Spring, Md. Extended Forecast Div.
J. Namias.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 27-48, 1972. 19 fig, 38 ref.

Descriptors: *Climatology, *Synoptic analysis, *Air-water interfaces, Weather, Climates, Ocean circulation, Air circulation, Air masses.
Identifiers: *Air-sea interactions.

Climatic fluctuations in the atmosphere of a month, season, or year are produced by circulation phenomena which, if persistent enough, may produce decadal, millenial and longer climatic aberrations. Recent short-period climatic fluctuations differ only in degree and not in kind from

great fluctuations of the past. Ocean variability is of a similar sort. When underlying sea-surface temperatures are studied in conjunction with these patterns, it is clear that the two media, air and sea, are coupled. The coupling takes place largely through heat exchange between sea and air and through water advection and mixing. For example, anomalous warm water temperatures in the cold months seem to encourage cyclone growth, while the cyclones frequently lessen evaporative heat losses by dampening the lower air with rain and by reducing back radiation through the formation of clouds. 2C. Snow, Ice, and Frost

A PRINCIPLES STUDY OF FACTORS AFFECTING THE HYDROLOGICAL BALANCE OF THE LEMON GLACIER SYSTEM AND ADJACENT SECTORS OF THE JUNEAU ICEFIELD, SOUTHEASTERN ALASKA, 1965-1969,
Michigan State Univ., East Lansing. Dept. of Geology.
M. M. Miller.
Available from the National Technical Information Service as PB-221 330, $6.00 in paper copy, $0.95 in microfiche. Completion Report Institute of Water Research, Michigan State University, Lansing, 1972. 294 p, 108 ref. OWRR B-002-MICH (4). 14-01-0001-1067.

Descriptors: *Glaciers, *Water balance, *Heat balance, Meteorological data, *Alaska.
Identifiers: Lemon Creek Glacier (Alas), Ptarmigan Glacier (Alas), Mass balance (Glaciers), *Juneau icefields.

The purpose is to consider those factors permitting establishment of the relationship between glacier mass balance, water balance, and heat balance and to include an overall assessment of the controlling meteorological parameters. The main analyses concern observations as they pertain to long-term trends affecting the regime of the Lemon and Ptarmigan Glaciers in southeastern Alaska. Initially it was hoped that the measurements could be made in greater detail than in any previous glacier investigations in southeast Alaska. To some extent this aim has been accomplished. Certainly more closely-spaced and more frequently checked observation sites were employed than in the study of the Lemon Glacier reported in 1964. Observations were also extended to include collection of data during periods of winter accumulation as well as in the summer ablation season. Considered in conjunction with a glacio-hydrological study on the Ptarmigan Glacier, and conducted in even more detail in the period 1966-1969, these data facilitate historical comparisons and add to the potential for forecasting future water budget trends. In a regional framework, this study provides information on a uniquely well-defined and completely self-contained glacier system ideally situated as a control location in the long-term glacio-climatic studies since 1946 on the Juneau Icefield, as well as for comparison with other coastal glacier systems originating in the complex of contiguous icefields in south and southeastern Alaska.

GREAT GLACIATIONS IN THE HISTORY OF THE EARTH (VELIKIYE OLEDENENIYA V ISTORII ZEMLI),
Akademiya Nauk SSSR, Moscow. Geologicheskii Institut.
B. M. Keller.
Sovetskaya Geologiya, No 9, p 26-35, September 1972. 1 fig, 54 ref.

Descriptors: *Glaciation, *Glaciers, *Glacial sediments, *Geologic time, Precambrian era, Paleozoic era, Quaternary period, Radioactive dating, Age.
Identifiers: USSR, *Geochronology, *Paleogeography, Tillites, Phanerozoic time, Riphean era, Ordovician period, Carboniferous period, Permian period.

Past great glaciations have been reliably established for Huronian deposits of the Canadian shield (tillites of the Gowganda formation dating back some 2 billion years in age), Upper Riphean deposits of Australia and South Africa, Wendian deposits of the Northern Hemisphere, Ordovician deposits of Africa, Upper Carboniferous and Lower Permian deposits of the Gondwana system, and anthropogenic (Quaternary) deposits. Great glaciations recur every 300 million years, and for the Phanerozoic generally coincide with the most important epochs of folding. The interval of time between two great glaciations corresponds to the duration of a cosmic year, this periodicity being particularly evident for the last two cosmic years. (Josefson-USGS)
W73-11095

INFLOW TO RIVERS IN THE PAMIRS (PITANIYE REK PAMIRA),
Moscow State Univ. (USSR). Chair of Hydrology.
S. Korimov.
Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 5, p 110-113, September-October 1972. 2 fig, 2 tab, 7 ref.

Descriptors: *Inflow, *Rivers, *Mountains, *Streamflow, *Runoff, Groundwater, Melt water, Snowmelt, Glaciers, Rainfall, Air temperature, Watersheds (Basins), Elevation, Hydrograph analysis, Estimating.
Identifiers: *USSR (Pamirs).

Estimates are made of the groundwater, snowmelt, and glacier contribution to annual streamflow for 15 rivers in the Pamirs. The groundwater contribution to streamflow varies between 20% and 53%. Glacier and snowmelt components of runoff are 13%-57% and 12%-50% of the total streamflow, respectively. The proportion of total annual runoff which occurs as rainfall is 0% to 3%. Studies are made of relations of snowmelt and glacier components of runoff to basin elevation and of April-September runoff of the Lyangar River to air temperature. (Josefson-USGS)

Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 5, p 103-106, September-October 1972. 1 fig, 7 ref.

Descriptors: *Glaciers, Glaciation, Glacial drift, Radioactive dating, Age, Pleistocene epoch, Recent epoch.
Identifiers: *USSR (Gorno-Altay Autonomous Oblast), *Glacier retreat.

Radiocarbon dating of glacial formations in the Chegan-Uzun and Chegan River valleys (Gorno-Altay Autonomous Oblast) reveals that the age of glaciers range from 3,200 plus or minus 600 years to 25,300 plus or minus 600 years. The Sofiyskiy glacier, measuring 7 km in length and located at absolute elevations of 2,600-2,615 m, is the largest of all glaciers in upper reaches of the Chegan River. In 1898-1939, the average rate of retreat of the glacier was 24 m/yr, and in 1939-62 it was 18.3 m/yr. In 1963-71, the rate of glacier recession dropped to 10 m/yr. Comparison of the average shrinkage rate in the Late Pleistocene (about 1 m/yr) and Holocene (about 2.4 m/yr) with that for the last 100 years (about 17 m/yr) suggests a continued rise in the glacier's rate of decline. CONTINUOUS OBSERVATIONS OF THE STRUCTURAL CHANGES IN DEFORMING POLYCRYSTALLINE ICE,
Washington Univ., Seattle. Dept. of Atmospheric Sciences.
R. M. Sprenger.
Available from NTIS, Springfield, Va., 22151 as AD-755 336, Price $3.00 printed copy; $0.95 microfiche. Scientific Report, November 1972. 69 p, 17 fig, 1 tab, 25 ref, append. ONR Contract N00014-67-A-0103-0007.

Descriptors: *Ice, *Glaciology, *Cryology, *Crystallography, Investigations, Deformation, Temperature, Crystals, Ice cover, Stress, Melting, Mathematical studies, Photography, Analytical techniques.
Identifiers: *Ice deformation, Ice mechanics, Ice structure changes.

An apparatus was constructed to continuously observe structural changes accompanying the deformation of polycrystalline ice. Thin sections of natural glacier ice and arctic sea ice were subjected to compressive stresses of several bars at temperatures near the melting point. Polarized light was used to obtain photographic sequences of the deformation. The observations were designed so as not to interrupt the deformation, in contrast to previous studies. Grain boundary migration and basal glide were observed over a wide range of stresses and temperatures, while polygonization and various types of recrystallization were restricted to small stress-temperature regions. No voids or cracks were formed in the ice during these experiments. Regelation and intercrystalline sliding were not detected. Photographs and tracings of the deformation sequences and other quantitative data related to the observations are included. (Woodard-USGS)

Descriptors: *Ice, *Ice jams, *Rivers, Meteorology, Ice breakup, Water level fluctuations, Deltas, Winter, Forecasting.
Identifiers: *Danube River, Ice thickness.

The 171-km-long Soviet reach of the Danube between Reni and Vilkovo was investigated for development of ice-jam forecasting techniques. The ice regime in lower reaches of the Danube is highly unstable. The probability of occurrence of ice phenomena is 82% and the probability of establishment of complete ice cover is 54% (1931-69). Depending upon hydrometeorological conditions in winter, the length of period between the first appearance of ice and its complete removal varies in individual years between 1 and 95 days. Ice formation and growth and decay of ice cover are accompanied by ice jams which occur at narrow river bends, islands, and channel constrictions. The thickness of ice jams is determined by a number of hydrometeorological factors including intensity of autumnal and winter cooling, severity of winter conditions, river discharges, intensity of spring processes (ice breakup), and presence of fast or floating ice. Specific examples are given of ice jams on the reach in winters of 1946-47, 1953-54, and 1966-67. (See also W73-11688) (Josefson-USGS)

Descriptors: *Ice, *Ice cover, *Forecasting, Synoptic analysis, Air circulation, Autumn, Winter.
Identifiers: *Dnieper River.

Fall and winter ice phenomena on the Dnieper River at Rechitsa, Sozh River at Gomel', and Desna River at Chernigov were investigated in 1938-67 for quantitative descriptions of macrosynoptic processes in the antecedent period of ice formation, and for influence of these processes on time of formation of complete ice cover in the Upper Dnieper basin. A graph shows the relation of the time of formation of complete ice cover at these locations to the index of macrosynoptic processes in August and September. This quantitative index can be used to forecast the time of formation of complete ice cover on these reaches by October 1, a month in advance of its earliest occurrence in the region. 2D. Evaporation and Transpiration

COMPARISON OF SIMULATED AND ACTUAL EVAPORATION FROM MAIZE AND SOIL IN A LYSIMETER,
Connecticut Agricultural Experiment Station, New Haven.
P. E. Waggoner, and N. C. Turner.
Agric Meteorol. Vol 10, No 1/2, p 113-123. 1972.
Identifiers: Diffusivity, *Evaporation, Humidity, Leaf, Lysimeter, *Maize-M, Net radiation, *Simulated evaporation, Simulators, Soils, Stomatal resistance, Temperature, Ventilation.

Evaporation from maize and soil in a pair of lysimeters in a maize crop, ventilation and net radiation above the crop canopy, temperature and humidity above and below the canopy, and leaf area and stomatal resistance in six strata of the canopy were observed during 12 1-hr periods. The measured evaporation was mimicked by an algebraic simulator of energy exchange in 6 canopy strata plus a 7th stratum occupied by bare stems and the soil surface when the observed stomatal resistance or a resistance that varied realistically with radiation was specified. If a constant stomatal resistance was specified, the simulation was inaccurate. Accurate simulation of evaporation from the soil required that diffusivity be decreased more rapidly within the lower canopy than the observed decrease in horizontal wind.--Copyright 1972, Biological Abstracts, Inc.

RADIATION, EVAPORATION AND THE MAINTENANCE OF TURBULENCE UNDER STABLE CONDITIONS IN THE LOWER ATMOSPHERE,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
W. Brutsaert.
Boundary-Layer Meteorology, Vol 2, p 309-325, 1972. 51 ref. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-water interfaces, Estimating equations, Mass transfer, Water cooling, Diffusion, Atmosphere.
Identifiers: *Turbulent diffusion.

An expression is derived relating the critical flux Richardson number with the critical (gradient) Richardson number. In contrast to an earlier analysis by Townsend (1958), which is restricted to the atmosphere well outside the earth's boundary layer, the present treatment is intended specifically for turbulent flow in the lower atmosphere and it takes account of the effect of evaporation on the stability. The effect of radiation on the rate of destruction of the mean square of the temperature fluctuations is obtained by considering the radiative flux divergence in a stratified atmsophere and by using a simple functional relationship to represent empirical emissivity data. Evaporation and radiation increase the critical Richardson number by a sensible amount depending on the atmospheric conditions, mainly temperature, humidity and the gradients. There is no definite critical Richardson number but rather a range between 0.25, below which turbulence is very likely, and somewhat higher than 0.5, above which turbulence is improbable. The value of the critical Richardson number can be expressed in terms of evaporation, radiation and the ratio (sigma sub w/u*) which also appears not to have a definite critical value. Evaporation and radiation cause the ratio (sigma sub w/u*) to be larger than unity under neutral conditions. These results, based on the assumption of Reynold's analogy, KH ± KM, are consistent with the available experimental evidence. (EPA)
W73-11343

A POWER WIND LAW FOR TURBULENT TRANSFER COMPUTATIONS,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
W. Brutsaert, and G-T Yeh.
Water Resources Research, Vol 6, No 5, p 1387-1391, October 1970. 2 tab, 40 ref. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-water interfaces, Estimating equations, Mass transfer, Water cooling, *Winds.
Identifiers: *Turbulent diffusion.

The parameters C and m of a power law for the wind profile u ± Cu* (z/z sub o)sup m, where u* is the friction velocity and z sub o is the roughness length of the surface, are determined as functions of the roughness and of the Monin-Obukhov stability length L through comparison with the log linear law for stable conditions and the interpolation law for unstable conditions. As expected, for neutral conditions the results show that m and C are approximately equal to 1/7 and 6, respectively. Parameter C increases slightly whereas m decreases with decreasing stability. (EPA)

COMPUTING EVAPOTRANSPIRATION BY GEOSTROPHIC DRAG CONCEPT,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
J. A. Mawdsley, and W. Brutsaert.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 99, No HY1, Proc Paper 9483 p 99-110, Jan 1973. 4 fig, 3 tab, 2 append. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-water interfaces, Estimating equations, Mass transfer, Water cooling, Diffusion, Atmosphere.
Identifiers: *Turbulent diffusion.

A procedure for computing regional evapotranspiration has been derived and tested. The assumptions underlying the model are essentially those used in the one dimensional mass transfer methods, but the shear stress is determined by means of (Tau sub o) ± rho (C sub g)squared (V sub go)squared in which rho ± the density of the air; C sub g ± the geostrophic drag coefficient as first proposed by Lettau; and V sub g ± the surface geostrophic wind. The main advantage of the method is that all data needed in the computation, i.e. the surface temperature, the pressure of the air, the specific humidity at two levels in the atmospheric boundary layer, and the surface geostrophic wind speed can be obtained from standard meteorological data. Generally, good agreement was obtained between mean monthly evapotranspiration computed for a number of stations and the corresponding evaporation data obtained from Class-A pans. (EPA)
W73-11345

UNIFIED FORMULATION OF WALL TURBULENCE,
Ebasco Services Inc., New York.
G-T Yeh.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol 98, No HY12, p 2263-2271, December 1972. 3 fig, 2 append. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-water interfaces, Estimating equations, Mass transfer, Water cooling, Diffusion, *Turbulent flow.
Identifiers: *Turbulent diffusion.

By incorporating the effect of the viscosity into the roughness length model, allowing the total shear stress to vary linearly, and modifying the mixing length, the present theory gives good results for the entire flow region. The resulting equation covers the smooth wall as well as the rough wall flow. The equation also provides a single formula to describe the velocity profile in the three near-wall regions for a smooth surface. (EPA)
W73-11346

SENSITIVITY OF THE SOLUTION FOR HEAT FLUX OR EVAPORATION TO OFF-DIAGONAL TURBULENT DIFFUSIVITIES,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
G-T Yeh, and W. Brutsaert.
Water Resources Research, Vol 7, No 3, p 734-735, June 1971. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-water interfaces, Estimating equations, Mass transfer, Water cooling, Diffusion, Atmosphere.
Identifiers: *Turbulent diffusion.

The purpose is to study the effect of the terms containing the off-diagonal diffusivity components on the solution of the case of evaporation or turbulent heat transfer from a strip at ground level of width 2 (x sub o) extending laterally to infinity. It was concluded that the effect of the off-diagonal diffusivity may be considered negligible in the calculation of evaporation from large surfaces. (EPA)
W73-11347

PERTURBATION SOLUTION OF AN EQUATION OF ATMOSPHERIC TURBULENT DIFFUSION,
Cornell Univ., Ithaca, N.Y. School of Civil and Environmental Engineering.
G-T Yeh, and W. Brutsaert.
Journal of Geophysical Research, Vol 75, No 27, p 5173-5177, September 20, 1970. 1 fig, 6 ref. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-water interfaces, Estimating equations, Mass transfer, Water cooling, Diffusion, Atmosphere.
Identifiers: *Turbulent diffusion.

The regular perturbation method with a small parameter is applied to solve a turbulent transfer equation in the lower atmosphere without the lateral effect. From this solution the effect of longitudinal diffusion on evaporation is shown to be negative but negligible for evaporating surfaces larger than, say, 100 cm in the direction of the wind. (EPA)
W73-11348

A SOLUTION FOR SIMULTANEOUS TURBULENT HEAT AND VAPOR TRANSFER BETWEEN A WATER SURFACE AND THE ATMOSPHERE,
Cornell Univ., Ithaca, N.Y., School of Civil and Environmental Engineering.
G. T. Yeh, and W. Brutsaert.
Boundary - Layer Meteorology Vol 2, p 64-82, 1971. EPA 16130 DIP.

Descriptors: *Evaporation, *Heat transfer, *Air-Water interfaces, Estimating equations, Mass transfer, Water cooling, Diffusion, Atmosphere.
Identifiers: *Turbulent diffusion, Water vapor transfer.

Interaction between sensible heat and water vapor diffusion in the lower atmosphere leads to the necessity of solving two simultaneous turbulent diffusion equations. This solution is obtained by the construction of Green's function which when incorporated in the boundary conditions produces two integral equations. These are solved by transformation into two algebraic equations by means of the Laplace Transformation. The results show how for a simple steady-state case, sensible heat and water vapor transfer and also the water surface temperature depend on the meteorological conditions and the rate of change of energy content of the water body. Due to advection, the water surface temperature and the turbulent fluxes vary in the downwind direction. However, for practical calculations of the mean evaporation or heat transfer, the error introduced by the use of an average temperature is usually quite small and negligible. (EPA)

VIRGINIA SMALL STREAMS PROGRAM, PRELIMINARY FLOOD-FREQUENCY RELATIONS,
Geological Survey, Richmond, Va.
E. M. Miller.
Open-file report, 1971. 28 p, 13 fig, 9 ref, 1 append.

Descriptors: *Floods, *Flood frequency, *Small watersheds, *Virginia, *Frequency analysis, Regression analysis, Hydrologic data, Equations, Analytical techniques, Correlation analysis, Frequency curves, Streamflow, Flood forecasting.

Techniques are presented for estimating the probable magnitude and frequency of floods on small streams in Virginia. Also included is the history and current status of the cooperative program of small stream flood frequency investigations in Virginia. Regression equations are based on records collected on streams that are virtually unaffected by the influences of urbanization. Therefore, the relations should not be used for estimating flood magnitudes and frequencies for streams with appreciable amounts of urbanization in their basins. Graphical techniques were used to define flood-frequency curves for small stream sites with the 5 to 10 years of available record. Also for the 1964-70 period, frequency curves were drawn for 20 long term record gaging stations in the Atlantic Slope basins and 14 long term record gaging stations in the Ohio River basins. Frequency curves using annual peaks for the total period of record were available for all the long term stations. The regression equations are applicable for estimating the 2, 5, and 10-year flood magnitudes at small stream sites in Virginia. (Woodard-USGS)

MINIMUM FLOW IN THE IBERIAN PENINSULA (MINIMAL'NYY STOK REK PIRENEYSKOGO POLUOSTROVA),
Moscow State Univ. (USSR). Chair of Hydrology.
K. S. Sivasami.
Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 5, p 81-86, September-October 1972. 3 fig, 2 tab, 8 ref.

Descriptors: *Low flow, *Low flow freqency, *Average flow, Rivers, River basins, Drainage area, Water balance, Variability, Mass curves, Maps.
Identifiers: USSR, *Iberian Peninsula, Spain, Portugal.

Characteristics of minimum flow in the Iberian Peninsula were based on observations of runoff at 294 hydrologic stations located principally on unregulated river reaches in Spain. Twenty-six percent of the stations had a period of record of more than 30 years, 44% had a period of record of more than 20 years, and 30% had a period of record of less than 20 years. Seventy-three percent of the stations had a drainage area of less than 1,000 sq km, 21% had a drainage area between 1,000 and 5,000 sq km, and only 6% had a drainage area of more than 5,000 sq km. Average monthly minimum flow from the peninsula is 29.00 cu km, of which 19.84 cu km (68.4%) is flow into the Atlantic Ocean and 9.16 cu km (31.6%) is flow into the Mediterranean Sea. The average rate of minimum monthly flow for the entire peninsula is 1.60 liter/sec/sq km. For the Atlantic slope it is 1.57 liter/sec/sq km, and for the Mediterranean slope it is 1.6 liter/sec/sq km. The coefficients of variation of average monthly mimimum flow vary widely. (Josefson-USGS)

Descriptors: *Turbidity, Average, *Rivers, *River basins, Lake basins, Drainage area, Discharge (Water), Rocks, Maps.
Identifiers: *USSR (Armenian SSR).

Average turbidity of rivers in the Armenian SSR is based on data for 22 rivers in the Kura and Araks River basins, and Lake Sevan basin. Maximum average turbidity occurs in the Kura River basin (270 g/cu m) and minimum average turbidity, in the Lake Sevan basin (60 g/cu m). For rivers in the Araks basin, turbidity averages 188 g/cu m. The average turbidity of all rivers in the Republic is 173 g/cu m. A map shows the division of the Republic into 7 zones, where turbidity values range from less than 100 g/cu m to more than 600 g/cu m. (Josefson-USGS)

INVESTIGATION OF SEASONAL VARIABILITY OF RUNOFF ON RIVERS IN THE ALTAY AND SAYAN MOUNTAIN SYSTEMS (ISSLEDOVANIYE VNUTRIGODOVOY NERAVNOMERNOSTI STOKA REK ALTAYA I SAYAN),
Moscow State Univ. (USSR). Chair of Hydrology.
V. D. Bykov, A. N. Vazhnov, and I. S. Fedorova.
Vestnik Moskovskogo Universiteta, Seriya V, Geografiya, No 5, p 23-31, September-October 1972. 3 fig, 2 tab, 5 ref.

Descriptors: *Runoff, *Rivers, *Mountains, *Variability, *Seasonal, Annual, Precipitation (Atmospheric), Floods, Melt water, Snowmelt, Glaciers, Elevation, River basins, Mass curves.
Identifiers: *USSR (Altay Mountains), *USSR (Sayan Mountains).

Changes in seasonal runoff with basin elevation and the relation of seasonal runoff to annual runoff were investigated for upper reaches of the Ob' and Yenisey Rivers and for reaches along the left bank of the Angara River. The relations obtained can be used to compute runoff characteristics for rivers in the Altay and Sayan mountain systems. (Josefson-USGS)

HYDROGRAPHIC STUDY OF THE SHELF AND SLOPE WATERS OF NEW YORK BIGHT,
State Univ. of New York, Stony Brook. Marine Sciences Research Center.
M. J. Bowman, and P. K. Weyl.
Available from NTIS AD-748 012, Springfield, Va. 22151, Price $3.00 printed copy; 95 cents microfiche. Technical Report Series No 16, August 1972. 46 p, 37 fig, 11 ref. ONR Contract No N00014-68-C-0298.

Descriptors: *Oceanography, *Atlantic Ocean, *Continental shelf, *Continental slope, New York, Water properties, Water temperature, Salinity, Ocean currents, Data collections, Sampling, Measurement, Boats, Hydrologic data, Ocean circulation.
Identifiers: *New York Bight, Gulf Stream, Temperature-salinity front.

Data are summarized from three oceanographic cruises made during 1970 and 1971 to investigate the physical characteristics of the shelf and slope waters of New York Bight. There was a sharp temperature-salinity front over the continental slope during the months of June 1970 and April 1971. Associated with this front was a subsurface warm tongue delineated by a temperature maximum which intersected the edge of the shelf at a depth of about 150 meters. Data obtained in August 1971 showed no evidence of any temperature front over the slope but suggested the existence of an irregular salinity gradient. Three factors appear to be important in the dynamics of the formation and dispersion of the subsurface warm tongue over the continental slope. These are the existence of the temperature-salinity front and the associated convergence zone, the meanderings of the Gulf Stream and the creation of warm eddies, and the intrusion of Labrador water into the Bight. (Woodard-USGS)

DISAGGREGATION PROCESSES IN STOCHASTIC HYDROLOGY,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering.
R. D. Valencia, and J. C. Schaake, Jr.
Water Resources Research, Vol 9, No 3, p 580-585, June 1973. 11 ref.

Descriptors: *Hydrology, *Time series analysis, *Stochastic processes, Data collections, Seasonal, Streamflow, Runoff, Simulation analysis, Mathematical models, Systems analysis.
Identifiers: *Disaggregation processes, Covariance, Variance, Parameter estimation, Matalas' multivariate model, Autoregressive models, Functional noise approximation, Sequential data generation.

The need to preserve both long-term and short-term variance and covariance properties of hydrologic processes has led to the development of numerous stochastic models during the past few years. Among these are the models first proposed by Mandelbrot and Wallis for preserving the Hurst phenomenon. All these models use sequential generation schemes, and some require the process to be stationary without seasonal variations. A technique is presented for generating multiple hydrologic time series in which both the short-term and long-term variance and covariance properties, including seasonal variations, are preserved. The technique combines any of the presently used models for sequentially generating annual events with a disaggregation model for generating seasonal, monthly, weekly, or daily events within a year. The model presented herein does not necessarily generate data sequentially, although the autoregressive models of any order are special cases of this model. If an annual series has been generated by this or any other model, this model may be used to generate a parallel series of seasonal events from the given series of annual events. The model has been used for rainfall generation in Puerto Rico, streamflow generation in Argentina and the United States, and for generation of hourly water demands in the Boston water distribution system. PHYSICAL MODELS OF LARGE SCALE OCEAN CIRCULATION,
Yale Univ., New Haven, Conn. Dept. of Geology and Geophysics.
G. Veronis.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 19-25, 1972. 2 fig, 3 ref.

Descriptors: *Ocean circulation, *Ocean currents, *Water chemistry, Oceanography, Winds, Tracers, Stratification, Thermal stratification, Topography.

Large scale ocean circulation is generated by wind stresses and by heat fluxes and salt fluxes (associated with evaporation and precipitation) at the surface. Flow below the wind-driven circulation is attributed to differences generated by differential solar insolation between equator and pole. The result is a poleward flow everywhere in the deep ocean. Boundary layer flow compensates for the unidirectional interior flow. This boundary current is on the western side of each basin. Western oceanic boundary regions (both abyssal and coastal) as well as regions of substantial topographic relief should be selected as sites for dense sampling. These regions are in contact with the deep water sources for most of the world's oceans and should provide the geochemist with the freshest concentrations of various tracers for each ocean. WATER RECORDS OF THE U.S. VIRGIN ISLANDS, 1962-69,
Geological Survey, Washington, D.C.
T. M. Robison.
Data report, 1973. 163 p, 4 fig, 2 ref.

Descriptors: *Streamflow, *Groundwater, *Water quality, *Virgin Islands, *Basic data collections, Water level fluctuations, Runoff, Gaging stations, Discharge measurement, Flow rates, Aquifers, Chemical analysis, Water analysis, Water chemistry, Water resources.

The surface water, quality of water, and groundwater records of the Virgin Islands from 1962 through 1969 are presented. The location of stations are shown on individual island maps. Each island map is followed by the tabulation of water records for that island. The records were collected by the Caribbean District of the Water Resources Division, U.S. Geological Survey, in financial cooperation with the Government of the Virgin Islands of the United States and the National Park Service. The base data collected at streamflow stations consist of records of stage and measurements of discharge. In addition, observations of factors affecting the stage-discharge relation, weather records, and other information are used to

supplement base data. A descriptive statement is given for each quality-of-water data station, usually combined with the description for a streamflow station or observation-well station. This statement includes the location of the sampling station, drainage area, period of record, records available, and selected extremes. Groundwater level data were obtained from a network of observation wells located at significant places in important aquifers. A well description precedes each data table. Included are the type, geology and location of the well, the extremes of water level, and the period of record. (Woodard-USGS)

AN INVESTIGATION OF FLOODS IN HAWAII THROUGH SEPTEMBER 30, 1972,
Geological Survey, Honolulu, Hawaii. Water Resources Div.
R. H. Nakahara.
Basic Data Release--Progress Report No 15, March 1973. 207 p, 5 fig, 1 tab.

Descriptors: *Floods, *Peak discharge, *Streamflow, *Hawaii, *Basic data collections, Hydrologic data, Gaging stations, Stream gages, Crest-stage gages, Flood frequency, Flood damage, Flood control, Annual peak discharge, Reviews.

This progress report contains records of annual peak stage and discharge at gaging stations through September 30, 1972, and a compilation of peak discharges at miscellaneous sites. At the close of the water year, flood data were being collected from 64 regular gaging stations and 93 crest-stage gaging stations on Kauai, Oahu, Molokai, Maui, and Hawaii. Annual flood peaks were recorded somewhere in the state during each month of the year except May, September, and October. Also included are annual maximum discharges, by water years, for each station. Floods, mainly because of the high frequency of intense rainfall, are common in Hawaii. Flood damages to crops, homes, highways, and other facilities, and pollution of bays and estuaries from storm runoff and sediment discharge occur nearly every year. Knowledge of the magnitude and probable frequency of floods is necessary for the proper design of control and conveyance structures, pollution abatement facilities, and planning for use of flood plains. DRAININGS OF ICE-DAMMED SUMMIT LAKE, BRITISH COLUMBIA,
Department of the Environment, Ottawa (Ontario). Water Resources Branch.
R. Gilbert.
Canada Department of the Environment, Inland Waters Directorate Scientific Series No 20, 1972. 17 p, 8 fig, 14 ref, 3 append.

Descriptors: *Lakes, *Glaciers, *Dam failure, *Melting, Canada, Ice breakup, Leakage, Water balance, Water temperature.
Identifiers: *Ice-dammed lakes, *Summit Lake (B C).

Drainings of ice-dammed Summit Lake, B. C., occurred in 1961, 1965, 1967, 1968, and 1970. In 1968, tests were carried out on a water balance model for the lake equating inflow and precipitation to volume change in the filling lake, determination of overflow when full, and detection of water leakage under or through the ice dam. The water balance study indicated that if one half of the area of the damming glacier contributed inflow, a leak of 3 to 5 cu m per sec existed in August 1968, three months before the fourth draining. Lake water temperatures were recorded from July to September 1968 and in July 1969. Warmest water (2.6 deg C) was found farthest from the dam in early summer. Temperature decreased at all locations from mid-July. The existence of a small tunnel associated with a continuous leak, and enlarging of this tunnel by melt provides a rational explanation for the catastrophic drainings. Heat generated by potential energy loss during draining is sufficient to account for tunnel enlargement. For the drainings of 1965, 1967, 1968, and 1970, lake water temperatures of 0.2 deg C, 0.9 deg C, 0.15 deg C, and 1.1 deg C, respectively, were required to account completely for tunnel enlargement in the terminal stages. (Knapp-USGS)

Water levels fluctuate widely in the Snake River, Wyoming because of the demands for irrigation waters by Idaho potato growers. This study was conducted to determine whether these fluctuations had any significant effect on the biota in the river. Five samples of exposed streambed (0.092 sq m by 0.1 m deep) were collected after flow was reduced from 2.8 to 0.3 cu m per sec. in less than 5 minutes, and aquatic invertebrates separated. A total of 15,490 invertebrates weighing 13.6 g were identified. Dipterans, caddisflies, mayflies, and stoneflies, in that order, were most abundant. A drift net and a migration trap placed below the riffles before drawdown showed that all of the macroinvertebrates in the exposed areas were left stranded. It was estimated that in a 3-km stretch of the river over 3 billion invertebrates were destroyed. In addition, 55 sculpins were left stranded in three 0.84 sq meter areas. The results indicate that fluctuating water levels may be more harmful to the production of sport fish than the actual destruction of prey organisms since algae and higher aquatic plants, which provide necessary habitat for these organisms, are also destroyed. Extreme low water levels may be more detrimental to productivity than fluctuating flows since other studies have shown that many organisms cannot adapt to alternating lotic and lentic habitats. It is concluded that flow conditions will have to be altered to improve the productivity of this area of the Snake River. (Little-Battelle)

FORMATION AND FORECAST OF COMPONENTS IN THE HYDROLOGIC REGIMEN OF RIVERS (FORMIROVANIYE I PROGNOZY ELEMENTOV GIDROLOGICHESKOGO REZHIMA REK).
Ukrainskii Nauchno-Issledovatelskii Gidro-Meteorologicheskii Institut, Kiev (USSR).

Ukrainskiy Nauchno-Issledovatel'skiy Gidrometeorologicheskiy Institut Trudy, No 112, L. T. Pashova, editor, Moscow, 1972. 88 p.

Descriptors: *Rivers, *Regimen, *Forecasting, Flood routing, Floods, Channels, Reservoirs, Hydrographs, Streamflow, Runoff, Discharge (Water), Inflow, Water loss, Melt water, Snowmelt, Ice jams, Ice cover, Meteorological data, Digital computers, Optimization.
Identifiers: *Ukraine, Travel time, Nomograms.

Streamflow forecasting, flood-wave movement, and ice regime of rivers are investigated in this collection of 8 papers. Dynamics of snowmelt losses during a spring flood are described, and methods are developed for preparing a short-term forecast of spring-flood hydrographs based on channel inflow and for forecasting quarterly inflow of water to Dnieper River reservoirs during the cold period of the year. To compute travel time on tributary reaches of rivers and propagation of flood waves along the cascade of Dnieper River reservoirs, the M-220 digital computer was used. Formation of ice jams on the Soviet reach of the Danube is discussed together with the possibility of forecasting the time of formation of complete ice cover in the Upper Dnieper basin based on quantitative descriptions of macrosynoptic processes. Descriptors: *Flood forecasting, *Hydrographs, *Hydrograph analysis, *Meteorological data, Flood routing, Channels, Inflow, Discharge (Water), Runoff, Rainfall, Time lag, Snowmelt, Snow, Curves.
Identifiers: Travel time.

Short-term forecasts of snowmelt runoff were based on lag time curves for the Teterev River at Makalevichi (drainage area--7,890 sq km; length--229 km), Uzh River at Polesskoye (drainage area--5,690 sq km; length--168 km), and Sozh River at Gomel' (drainage area--38,900 sq km; length--543 km). Channel inflow for the Uzh and Teterev Rivers was calculated from average snowmelt intensity for the basin, while channel inflow for the Sozh River was calculated from snowmelt intensity in the zone of maximum discharge with allowance for regulation of runoff by snow cover and basin surface, dynamics of snowmelt losses, and rainfall during the snowmelt period. To determine beginning dates of snowmelt and to define parameters of lag time curves, the runoff of small basins was used. Channel inflow was calculated from data of a hydrometeorological network. Descriptors: *Water loss, *Snowmelt, *Runoff, *Spring, *Small watersheds, Snow, Snow cover, Water equivalent, Water yield, Precipitation (Atmospheric), Soil moisture, Snow surveys, Probability, Curves, Equations.
Identifiers: *Ukraine, Nomograms.

A method is proposed for calculating snowmelt losses during a flood by considering the dynamics of snomelt losses in time and the regulating capacity of snow cover. Data used for computations in the 42-sq-km Golovesnya River basin include snowmelt intensity, precipitation, area of water yield, and snowmelt runoff conditions. Snowmelt was claculated from the temperature coefficient of melting and from the Shulyakovskiy nomogram, and water yield was determined at different values of the water-retaining capacity of snow. Runoff conditions were determined from the relation of soil moisture to depth of soil freezing. Methods are presented for defining curves of probability for the water equivalent of snow, and an evaluation is made of the computed snowmelt losses. (See also W73-11688) (Josefson-USGS)

BEHAVIOR OF GROUNDWATER FLOW SUBJECT TO TIME-VARYING RECHARGE,
Water Resources Engineers, Inc., Springfield, Va.
M. T. Tseng, and R. M. Ragan.
Water Resources Research, Vol 9, No 3, p 734-742, June 1973. 12 fig, 9 ref.

Descriptors: *Hydrologic systems, *Water resources development, *Groundwater movement, *Groundwater recharge, *Aquifers, *Methodology, Mathematical models, Systems analysis, Engineering, Planning, Streams.

The knowledge of dynamic response in a free surface groundwater flow system is of practical importance in many engineering applications. Problems such as drainage systems, earth dam designs, stream base flow estimate, and more recently groundwater pollution have been the major concerns of engineers and hydrologists. A numerical method is presented that is practical for application to the near field study of localized recharge for engineering feasibility and planning efforts. The dynamic response of two-dimensional unconfined aquifers subject to localized recharge is investigated. The variations of free surface profiles, discharges, and the flow patterns with respect to time in both fully penetrated and partially penetrated aquifer systems have been obtained by solving the governing partial differential equations numerically. The method treats the nonlinear free surface boundary as an initial condition, and the overall flow region has been solved as a boundary value problem at a given time. The numerical results agree with experimental data obtained from Hele-Shaw models. The method may be applied to study the quantitative and qualitative changes in groundwater reservoirs resulting from artificial or natural recharge. The method gives a point of departure for study of groundwater pollution. (Bell-Cornell)

Descriptors: *Groundwater movement, *Tracers, *Radioactivity techniques, *Instrumentation,

Tracking techniques, Radioisotopes, Adsorption, Water wells.

A method to determine groundwater flow in single wells is based on introducing an isotope solution into the borehole as an indicator and measuring the direction of the water movement with a probe. In the probe, detection of the indicator substance is indirect. It is absorbed by ion exchangers and then, after the removal of the probe, the amount of te absorbed indicator is measured. The dimensions of the device allow its use in 150 mm holes. (K-napp-USGS)

Identifiers: *USSR (Tuva ASSR), *Mineral springs, Mineralization, Radon, Balneology.

To construct a map of mineral water in East Siberia on a scale of 1:2,500,000 investigations were conducted in the Tuva ASSR in 1966-67. Mineral water in the Republic is divided into 8 types: (1) nitrogen thermal water; (2) carbonated thermal water; (3) carbonated nonthermal water (temperature < 20 deg C); (4) radon nonthermal water; (5) sodium-chloride saline water; (6) acidic water (pH < 5.5); (7) low-salinity, nonthermal water in a weak hydrogen-sulfide solution (H2S > 0.01 g/liter); and (8) arsenic-bearing water. Five hydromineral regions are identified: (1) the Eastern Sayan region of carbonated water and nitrogen thermal springs; (2) the Altay-Western Sayan region of nitrogen thermal springs; (3) the Khubsugul'skaya region of nitrogen thermal springs; (4) the Tuva region of mineral water of mixed composition; and (5) the Ubsu-Nur region of chloride and sulfate waters and brines. Thermal and carbonated waters are associated with fractures and recent volcanism; radon waters are confined to granitoid intrusions; and saline water is developed within intermontane valleys. As a result of investigations, the number of known mineral springs in the Republic has increased from 22 to 34. (Josefson-USGS)

THE ENVIRONMENTAL TRITIUM CONCENTRATION OF UNDERGROUND WATER AND ITS HYDROLOGICAL INTERPRETATION,
Commonwealth Scientific and Industrial Research Organization, Glen Osmond (Australia). Div. of Soils.
G. B. Allison, and J. W. Holmes.
Journal of Hydrology, Vol 19, No 2, p 131-143, June 1973. 5 fig, 3 tab, 23 ref.

Descriptors: *Tritium, *Groundwater movement, *Water balance, Recharge, Discharge (Water), Tracers, Mixing, Springs, Australia, Model studies.

Models which attempt to correlate the tritium concentration of water taken from aquifers to aquifer parameters are discussed. One model takes into account flow along individual streamlines and relates aquifer parameters to the observed tritium concentration at outflow. For the Gambier Plain unconfined aquifer in southern Australia, the calculated tritium concentration at outflow derived from known aquifer parameters is 0.7 T.U. The measured tritium concentration of several springs at outflow is also 0.7 T.U. Using the complete mixing model and the approximation that samples withdrawn from the aquifer on Eyre Peninsula, South Australia, are fully mixed, the mean annual recharge for the area is estimated at 3 cm/yr. (Knapp-USGS)

THE INFLUENCE OF DELAYED DRAINAGE ON DATA FROM PUMPING TESTS IN UNCONFINED AQUIFERS,
Sheffield Univ. (England). Dept. of Civil and Structural Engineering.
N. S. Boulton.
Journal of Hydrology, Vol 19, No 2, p 157-169, June 1973. 2 fig, 9 ref.

Descriptors: *Aquifer testing, *Drawdown, *Water yield, Aquitards, Permeability, Hydrogeology, Anisotropy, Equations.
Identifiers: Delayed yield.

Equations are given for the flow to a pumped well in an aquifer having uniform anisotropy and overlain by a low-permeability aquitard. The water table is assumed to be located in the aquitard. Drainage from the capillary zone above the water table is taken into account. The formation constants may be evaluated by using type curves. A well-known pumping test is reanalyzed, using the given equations. The time-drawdown curves can be explained only by the existence of a low-permeability stratum in the vicinity of the water table. In this example the slow draining of the unsaturated zone above the water table seems to be a significant factor in determining the shape of the time-drawdown curves. (Knapp-USGS)

AVAILABILITY OF GROUNDWATER FOR PUBLIC-WATER SUPPLY IN CENTRAL AND SOUTHERN ESCAMBIA COUNTY, FLORIDA: INTERIM REPORT, JULY 1972,
Geological Survey, Tallahassee, Fla.
H. Trapp, Jr.
Geological Survey open-file report 72029, 1973, 100 p, 5 fig, 14 ref, 1 append.

Descriptors: *Groundwater resources, *Water wells, *Aquifers, *Water quality, *Florida, Well data, Aquifer characteristics, Water yield, Groundwater recharge, Water utilization, Water supply, Water resources development, Chemical analysis, Hydrologic data, Data collections, Water levels, Test wells, Drillers logs.
Identifiers: *Escambia County (Fla), *Pensacola (Fla).

Earlier hydrologic studies show that ample quantities of soft water of low dissolved solids content are obtainable from the sand-and-gravel aquifer in central and southern Escambia County, Fla. Some wells drilled for the city of Pensacola have yielded water with unacceptably high amounts of iron and carbon dioxide, and some wells have had low yields. The city, therefore, is seeking hydrologic information, including water-quality data, in an effort to avoid the high cost of well abandonment and to plan for future expansion of the water-supply system. The project area extends from the western end of Santa Rosa Island, through Pensacola to State Road 196 north of Quintette. The investigation included the collection of well data, chemical analyses of water samples, test drilling, radioactivity logging of test holes and other wells, and water-level measurements. Quality-of-water maps have been updated from the first year's report (See W72-09267), and graphic logs of the test holes drilled during the second year of the project are presented. (Woodard-USGS)

GROUND-WATER QUALITY IN WISCONSIN THROUGH 1972,
Geological Survey, Madison, Wis.
C. L. R. Holt, Jr., and E. L. Skinner.
Wisconsin Geological and Natural History Survey Information Circular No 22, 1973. 148 p, 6 fig, 2 tab, 46 ref.

Descriptors: *Hydrogeology, *Groundwater movement, *Groundwater resources, *Water quality, *Wisconsin, Hydrologic data, Reviews, Evaluation, Water yield, Water analysis, Chemical analysis, Geochemistry, Dissolved solids, Aquifers, Water wells, Erosion rates.

Available information on the quality of groundwater in Wisconsin is summarized. Major sources for this information are more than 30 technical reports that describe groundwater resources and quality in river basins, counties, and special study areas. A background of chemical-quality data is presented on groundwater as it occurs in natural and man-modified environments. These data constitute a base for planning and managing the water and land resources of Wisconsin. The water quality monitoring program for goundwater is described. In Wisconsin, the average dissolved-solids content of groundwater discharged to lakes and streams and from wells is about 200 mg/liter; groundwater discharge is estimated to be 16 billion gallons per day; about 87 tons per square mile of mineral matter is being dissolved annually from soil and rocks. 2G. Water in Soils

A NEW METHOD FOR THE SOIL MOISTURE MEASUREMENT (MOMIN'S METHOD),
J. Kubo.
Available from NTIS, Springfield, Va 22151 as N-72 28349, Price $3.00 printed copy; $0.95 microfiche. National Aeronautics and Space Administration Technical Translation TT F-14394, July 1972. 8 p, 3 fig, 4 ref. (Translation of 'Shin Dojo Suibun Sokuteiho (Momin Ho No Jisshi)', Agricultural Meteorology (Japan), Vol 8, p 108-110, 1953.

Descriptors: *Soil moisture meters, *Soil moisture, Measurement, Thermal conductivity, Instrumentation, Methodology, Soil temperature, Correlation analysis, Thermometer.
Identifiers: Metallic plate.

A new method for soil moisture measurement which utilizes thermal conductivity is presented. In the traditional method of utilizing the thermal conductivity, a metallic plate buried in the soil is heated electrically and its temperature measured, but this method is quite troublesome. In the experiment, the latter half of the bulb of a mercury thermometer was wound with a heating wire. This heating part was electrically and thermally insulated from the soil. The bulb was heated by a constant electric current, and the time was measured in seconds for the temperature to rise by 5 deg C. The principle of this method is that within the bulb, the half on which the heating wire is wound gains heat, while the other half, which is in contact with the soil, loses heat in a certain proportion due to the thermal conductivity of the soil. When the variation in the soil temperature is large, the linear relationship must be determined for at least 2 to 3 kinds of temperature range. Furthermore, if the contact between the tip of the bulb and the soil is not perfect, an unexpected error may be created; it also becomes necessary to obtain a linear relationship for each soil where the apparatus is installed. (Woodard-USGS)

ANALYSIS OF SOIL TEMPERATURES IN THE ARID ZONE OF INDIA BY FOURIER TECHNIQUES,
Central Arid Zone Research Inst., Jodphur (India).
A. Krishnan, and R. S. Kushwaha.
Agric Meteorol. Vol 10 No 1/2, p 55-64, 1972. Illus.
Identifiers: *Arid lands, Fourier avalysis, Harmonics, *India, Infiltration, Mass, Moisture, Monsoons, Rainfall, *Soil temperature.

Harmonic analyses of weekly means of soil temperatures were made at Jodhpur, India with sandy to loamy sand soil (clay content 6-8%). The amplitudes and phase angles corresponding to various depths in respect of different harmonics are presented. The amplitudes for various depths vary between 4.8 deg C and 9.1 deg C for first harmonic and decrease sharply with higher order harmonics. The values for 4th harmonic are 0.12-0.64 deg C only. The warmest soil near the soil surface occurs on June 28 while at 120 cm depth, the highest temperature maximum occurs on July 29, a delay of 1 mo. The 2nd and 3rd harmonics represent 8-22 and 0.6-4% of total variance, respectively. This effect of monsoon period on soil temperature profile at Jodhpur is due to infiltration of rainfall. The change in soil temperature pattern after July due to occurrence of the southwest monsoon is well reflected, if the 3rd harmonic is superimposed on the sum of the 1st 2 harmonics. The thermal diffusivity computed from amplitude variation and from phase displacement do not agree-showing the non-applicability of the theory of heat conduction in a semi-infinite homogeneous medium for Jodhpur soil. The mass movement of moisture during the monsoon and flow of moisture in the vapor phase probably invalidate the application of this simple theory.--Copyright 1972, Biological Abstracts, Inc.

MOISTURE TRANSFER AND FROST HEAVE IN LOAMS,
B. I. Dalmatov, V. D. Karlov, and V. M. Sokolova.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 53-59, 1971. 4 fig, 2 tab, 6 ref.

Descriptors: *Frost action, *Moisture content, *Soil water movement, *Frost heaving, Heat transfer, Freezing, Thawing, Unsaturated flow, Soil mechanics.

The moisture transfer process in loam depends on density and moisture content. Analysis for this process was based on the methods of heat transfer theory. Moisture transfer potential fully characterizes the moisture migration intensity, and the migration depends basically on moisture gradient. The experimentally established relationship between moisture transfer potential and initial moisture volume of loam has a linear character. Experiments on frost heave were carried out with loam samples having different densities and consistencies. A linear relationship between frost heave and initial moisture content was established. Testing of nonsaturated samples showed the influence of volume increase in water on frost heave, the formation of new pores and microfissures, and shrinkage. (Knapp-USGS)

BEHAVIOUR OF FINE SANDS AND SILTS DURING THE RISE OF GROUND-WATER LEVEL,
Ceskoslovenska Akademie Ved, Prague. Ustav Teoretiche a Aplikovane Mechaniky.
J. Havilicek.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 121-126, 1971. 3 fig, 4 ref.

Descriptors: *Soil mechanics, *Foundations, *Saturation, *Silts, *Bearing strength, Water level fluctuations, Water table, Sands, Infiltration, Soil strength, Soil engineering, Soil physical properties, Soil structure, Soil water, Soil moisture.
Identifiers: *Soil liquefaction.

Saturation of some dry silty soils leads to their liquefaction. This phenomenon is particularly important for countries where the summers are very hot and dry, the winters rainy, and where the subsoil is silty. In the calculation of the bearing capacity of silty soils, decrease of safe foundation depth must be taken into account. (Knapp-USGS)

PORE PRESSURE MEASUREMENTS IN AELOTROPIC PEAT,
Helsinki Univ. of Technology, Otaniemi (Finland). Dept. of Civil Engineering.
K. V. Helenelund.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 127-134, 1971. 6 fig, 9 ref.

Descriptors: *Peat, *Pore pressure, *Anisotropy, *Soil physical properties, *Soil tests, Soil strength, Consolidation, Shear, Soil mechanics.
Identifiers: *Aelotropic peat.

Pore pressures in fibrous peat show great variations in the pore water pressure depending on the direction of the applied stress. High pore water pressures are observed in vertical tests with the major principal stress perpendicular to the horizontal fiber plane of the peat. Considerably smaller pore water pressures are observed in horizontal tests, with the major principal stress acting parallel to the fiber plane. Due to the tensile strength of the fibers, the lateral displacements in vertical unconfined compression tests are small, and the dilatation is compensated by high pore water pressures. In horizontal tests the lateral tensile strength perpendicular to the fiber plane is small, the cross section of the sample increases, and the pore water pressure decreases. In this case a part of the load is carried by an effective fiber stress in an early stage of the test. The increase in pore water pressure is small until the angle between the fiber plane and the major principal stress exceeds 30 deg, and a considerable increase in the pore water pressure is observed when this angle exceeds 60 deg. (Knapp-USGS)
W73-11195

RELATIONSHIPS BETWEEN VOLUME AND PORE-WATER CHANGE AND SHEAR STRESS IN GRANULAR SOILS,
Ceskoslovenska Akademie Ved, Prague. Ustav Teoreticke a Aplikovane Mechaniky.
B. Kamenov.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 143-154, 1971. 6 fig, 11 ref.

Descriptors: *Soil mechanics, *Soil tests, *Sands, *Pore water, Stress, Strain, Shear, Compressive strength, Soil strength, Pore pressure, Density, Porosity.

Shear box and triaxial tests were made on Zbraslav sand. The shear box tests used constant and variable sample height, and both drained and undrained triaxial tests were made with initial pore-water pressure and with different cell pressures and initial densities. The influence of volume strain and pore-water pressure gradients on the shearing resistance was studied. The relations were linear and influenced by the loading path and stress level, by the geometrical arrangement of the structural system in question, and by the kinematic conditions of the deformation process. A method to find the residual shearing resistance based on the zero gradient of volume strain and pore-water pressure in triaxial tests is proposed. The residual resistance of granular soils was independent of the loading path. It is affected by the nature of the tested material and, if crushing of grains could take place, by the stress level in the failure plane. (Knapp-USGS)

BEHAVIOUR OF TRANSITION SOILS UNDER THE EFFECT OF WATER,
Technical Univ. of Budapest (Hungary).
A. Kezdi, L. Marczal, E. Biczok, and I. Kabai.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 165-176, 1971. 12 fig, 1 tab, 4 ref.

Descriptors: *Soil mechanics, *Soil moisture, *Soil strength, Soil structure, Loess, Silts, Sands, Clays, Bearing strength, Water levels, Saturation, Infiltration, Permeability, Hydraulic conductivity, Soil physical properties.
Identifiers: Soil liquefaction.

In Hungary most of the land surface is covered with transition soils between sand and clay. These soils include silts and silty fine sands. In the transition soils severe erosion occurs under the effect of surface water movement. When the soils are saturated, the weak cohesion rapidly disappears and the soil disintegrates; under the effect of inundation the loaded soil collapses. The phenomena taking place at the surface of grains are predominantly physical processes involving the interaction of water and surfaces of rough grains. The bond between the grains is weak, and the strength responds quickly and very sensitively to the change in water content. In the transition soils the pores are commonly large enough to allow a relatively free movement of water. Under the effect of dynamic load, these soils behave very elastically. (Knapp-USGS)

COEFFICIENT OF PERMEABILITY OF HIGHLY PLASTIC CLAYS,
Kanazawa Univ. (Japan). Dept. of Engineering.
Y. Nishida, H. Koike, and S. Nakagawa.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 219-224, 1971. 5 fig, 5 ref.

Descriptors: *Permeability, *Clays, *Clay minerals, *Void ratio, Consolidation, Adsorption, Compaction, Soil physical properties, Expansive clays, Soil water movement.

From theoretical calculation of the water flow in the pore space of clays where the individual particles are surrounded by absorbed water layers, a relationship was established between the coefficient of permeability and the void ratio. By extending the use of the Hazen-Poisseuille equation to highly plastic clays, the coefficient of permeability was found to be proportional to the 5th power of the void ratio. (Knapp-USGS)

USE OF PHYSICAL METHODS TO EXPAND SOIL SURVEY INTERPRETATIONS OF SOIL DRAINAGE CONDITIONS,
Wisconsin Univ., Madison. Dept. of Soil Science.
J. Bouma.
Soil Science Society of America Proceedings, Vol 37, No 3, p 413-421, May-June 1973. 9 fig, 36 ref.

Descriptors: *Hydraulic conductivity, *Model studies, *Soil water movement, Numerical analysis, Hydraulic models, Permeability, Soil physical properties, Soil surveys, Soil physics.

Complex numerical procedures and simple approximate physical methods, both requiring hydraulic conductivity and moisture retention data, can be used to calculate hydrodynamic soil behavior for a variety of simplified boundary conditions. Two approximate methods were applied to four Wisconsin soils in which measurements of hydraulic conductivity had been made in situ. Two soils that had been placed previously in different drainage classes on the basis of differences in soil mottling, actually had comparable hydrologic properties. Soil survey methods do not provide the quantitative data needed for predicting what soil behavior will be under environmental conditions that have changed temporarily or permanently. (Knapp-USGS)

RELATIONSHIPS BETWEEN SATURATED HYDRAULIC CONDUCTIVITY AND MORPHOMETRIC DATA OF AN ARGILLIC HORIZON,
Wisconsin Geological and Natural History Survey, Madison.
J. L. Anderson, and J. Bouma.
Soil Science Society of America Proceedings, Vol 37, No 3, p 408-413, May-June 1973. 3 fig, 2 tab, 14 ref.

Descriptors: *Hydraulic conductivity, *Saturated flow, *Soil water movement, Tracers, Sampling, Pores, Permeameters, Cores, Equations.
Identifiers: *Soil morphometry, *Pore geometry.

A method of calculating saturated hydraulic conductivity in soil on the basis of morphometric data yielded reproducible results for seven soil peels sampled in the argillic horizon of a Batavia silt loam. Calculated values were reasonably close to those measured in situ with the double tube method. The method was also successfully applied to impregnated horizontal sections through soil cores. Dye studies demonstrated the validity of some of the underlying assumptions of the method, which predicts a strong relationship between core height and measured hydraulic conductivity. Experiments confirmed this relationship and a representative core size was defined for the studied horizon using the morphometric data. (Knapp-USGS)

STEADY-STATE SEEPAGE IN A HILLSIDE,
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
G. C. A. Morin, and A. W. Warrick.
Soil Science Society of America Proceedings, Vol 37, No 3, p 346-351, May-June 1973. 4 fig, 2 tab, 11 ref.

Descriptors: *Seepage, *Soil water movement, *Equations, *Slopes, Mathematical studies, Flow nets, Overland flow, Infiltration, Soil erosion.

Two-dimensional seepage of water from a hillside adjoining a flat horizontal plane at its lower end was solved using the complex potential function. The complex potential is a function of position and can be used to determine the hydraulic potential, the stream function, and the velocity distribution. The flow velocity and direction are closely related to movement of chemical constituents into and from the soil surface, amount of subsurface flow and surface flow, erosion hazards and seepage spots. Two cases were considered: in the first a straight slope of finite length intersects an infinitely wide horizontal plane; in the second, a horizontal plane of finite width is between two symmetric hillsides. Flow nets and graphical relations show the flow patterns. (Knapp-USGS)

RETENTION AND RELEASE OF SOIL WATER AS RELATED TO MINERALOGY OF THE SOIL CLAYS,
Indian Agricultural Research Inst., New Delhi. Div. of Soil Science and Agricultural Chemistry.
M. H. Ali, and T. D. Biswas.
J Indian Soc Soil Sci. Vol 19, No 4, p 363-368. 1971. Illus.
Identifiers: *Clays (Bentonite), Illite, Kaolinite, Mineralogy, Montmorillonite, Retention, *Soil water.

Retention and release of water were maximum in bentonite (clay) followed by illite and kaolinite. With rise in matric suction, the difference in the retention by these clay minerals decreased. At 10 centibar, bentonite retained 244% more water than kaolinite, whereas at 15 bar, it was merely 9%. The black soils, being very fine textured and having montmorillonite as the dominant clay mineral, retained and released the largest amount of water, followed, in general, by the alluvial (illitic) and lateritic (kaolinitic) soils. Moreover, the water retention curves of the back, alluvial, red and lateritic soils resemble those of bentonite, illite, and kaolinite respectively. Both the nature and amount of the clays are important factors in determining the water retention characteristics of soils.--Copyright 1972, Biological Abstracts, Inc.

Identifiers: Distribution, *India (Ib watershed), Morphology, *Soils, Watersheds.

Widely different soils following sequences of geomorphic components were recognized and arranged in 2 catenas in lower Ib watershed covering parts of the districts of Sundergarh and Sambalpur in Orissa State (India). Topographic variations regulate hydrological conditions modifying soil climate as locally arid or locally humid which, in turn, influences pedogenic processes. Morphological features like depth, color distribution of clay in profiles, etc. and also physico-chemical properties of different members of these 2 catenas distinctly indicate the heterogeneity in soil development and reflect direct relationship with different hydrological conditions modifying soil climate due to topographical variations, while overhead climate and parent materials are of subsidiary values.--Copyright 1972, Biological Abstracts, Inc.

MEASUREMENT OF CONTACT ANGLE OF WATER IN SOILS AND SAND,
Indian Inst. of Tech., Kharagpur. Dept. of Agricultural Engineering.
Dhan Pal, and S. B. Varade.
J Indian Soc Soil Sci. Vol 19, No 4, p 339-343. 1971.
Identifiers: *Contact angle (Water), Equations, Measurement, Poiseuilles equation, *Sand, *Soils.

The contact angle of water in soils and sand was measured using the infiltration and capillary rise method respectively. The contact angle of water to the soil is not 0 and even in wettable soil the effective contact angle is much larger. The order of magnitude of the soil-water contact angle among 5 soils was as follows: Sandy loam soil > red soil > laterite soil > black soil > clay soil. In sand, the magnitude of contact angle was not influenced by the treatment of hydrophobic substance such as pyrogallol used in present study. The Poiseuille's

equation worked well for soils but not for pure sand.-oCopyright 1972, Biological Abstracts, Inc.

CAPILLARY-DIFFUSION AND SELF-DIFFUSION OF LIQUID WATER IN UNSATURATED SOILS,
Kentucky Univ., Lexington. Dept. of Agronomy.
V. L. Quisenberry, Jr.
M Sc Thesis, 1971. 79 p, 18 fig, 31 ref. OWRR A-011-KY (2).

Descriptors: *Soil moisture, *Diffusion, *Capillary water, *Unsaturated flow, *Kentucky, Soils, Soil water movement, Saturated flow, Laboratory tests, Analytical techniques, Inflow, Discharge (Water), Moisture content, Agriculture.
Identifiers: Diffusion coefficients (Soils).

Capillary-diffusion and self-diffusion coefficients were determined by laboratory methods for several Kentucky soils: Maury silt loam, Pembroke silt loam, Eden silty clay loam, Burgin silty clay loam, Henry silt loam, Huntington loam, and Yolo loam. Capillary-diffusion coefficients were measured by use of inflow and outflow methods. With both methods the capillary-diffusion coefficients decreased very rapidly with decreasing water content. The soils with lower clay contents had higher diffusion coefficients over the entire moisture content range studied, 0 to 1 bar tension, than the soils with the higher clay contents. A comparison of the two methods showed that the inflow method yielded slightly higher capillary-diffusion coefficients for the Yolo, Huntington, and Pembroke. The inflow method gave coefficients about an order of magnitude greater than the outflow method for the Burgin silty clay loam. This difference was explained on the basis of the swelling property of the dominant clay mineral in the soil, montmorillonite. The two methods yielded approximately the same values for the Maury and the Eden. (Woodard-USGS)

THE CLASSIFICATION OF ARID ZONE SOILS: I. AN APPROACH TO THE CLASSIFICATION OF ARID ZONE SOILS USING DEPOSITIONAL FEATURES,
Hunting Technical Services Ltd., Boreham Wood (England).
S. Western.
J Soil Sci., Vol 23, No 3, p 266-278, 1972. Illus.
Identifiers: Aeolian, Anthropic, Arid zones, Classifications, Depositional features, Depth, Fluvial, Irrigation, Littoral, Salinity, *Soils (Arid zone), Stratification, Texture, *Soil classification, Sediments.

Soils in regions of arid and semi-arid climates exhibit only limited pedogenetic profile development, and they might be more usefully described, classified and mapped in terms of their depositional character. The main source of understanding of their origins and practical significance is likely to be the sedimentary geomorphology of the area concerned, rather than the minimal pedogenetic features. The term 'sedosols' is proposed for these soils and a method of classification is outlined, based on depositional features and origins. Sub-orders are based on mode of deposition to give 4 sedimentary families, viz. fluvial, littoral, aeolian, and anthropic. In lower category classification, series based on pedogenetic features cannot be defined and are replaced by the 'depositional series' characterized by the types of sediment (e.g. coarse textured, fine textured, saline, non-saline). Typical phases are based on soil depth and degree of erosion. Salinity induced by irrigation is also best recognized at phase level as it is essentially an ephemeral feature. The 3 major differentiating characteristics of sedosols are soil texture, degree of depositional stratification and effective soil depth. (See also W73-11418)--Copyright 1973, Biological Abstracts, Inc.
W73-11417

THE CLASSIFICATION OF ARID ZONE SOILS: II. THE CLASSIFICATION OF SEDOSOLS IN SOUTH ARABIA,
Hunting Technical Services Ltd., Boreham Wood (England).
S. Western.
J Soil Sci, Vol 23, No 3, p 279-297, 1972. Illus.
Identifiers: *Arabia, Arid zones, Deposition, Mapping, Moisture, Morphology, Sedimentary, *Sedosols, *Soils (Arid zone), *Soil classification.

In the arid environment of South Arabia the soils (sedosols) are not significantly affected by pedogenetic processes. Classification of these soils is therefore in accordance with the principles based upon a consideration of the mode of deposition rather than on considerations of pedogenesis. Sedimentary geomorphology, soil classification, soil mapping are discussed for 2 areas of South Arabia. Mapping purity was satisfactory and reliability was probably greatest in series that were wholly anthropic or wholly natural in origin. In classifying land for single-flood irrigation agriculture, the total readily available moisture capacity is the major land classification factor. It is a function of texture and effective depth, modified in places by severe stratification. (See also W73-11417)--Copyright 1973, Biological Abstracts, Inc.

ADSORPTION CHARACTERISTICS OF OPALINE CLAYS FROM THE EOCENE OF GEORGIA,
Georgia Univ., Athens.
R. E. Carver.
In: Proceedings of the Seventh Forum on Geology of Industrial Minerals, April 28-30, 1971, Tampa, Florida; Florida Department of Natural Resources Special Publication No 17, p 91-101, June 1972. 5 fig, 5 tab, 11 ref. OWRR A-006-GA (11).

Descriptors: *Adsorption, *Moisture uptake, *Clays, *Mineralogy, Georgia, Adsorption, Physical properties, Chemical properties, Analytical techniques, X-ray diffraction, Porosity, Water vapor, Correlation analysis, Montmorillonite, Quartz, Industrial production.
Identifiers: *Fuller's earth, Opaline clays, Ethylene glycol.

Opaline clays from central and eastern Georgia are widely used as industrial and domestic absorbants, principally as insecticide carrier and animal litter. The clays are classified as fuller's earth, although they are somewhat atypical of the group, since opal (cristobolite) is commonly the dominant clay-sized mineral. An investigation of absorption characteristics indicated that water vapor absorption (264 days) is related to opal content as determined by x-ray diffraction peak height ratios. Ethylene glycol vapor absorption is related to montmorillonite content. Contact absorption of water is complexly related to surface absorption, porosity, opal content and montmorillonite content, and may be as great as 112% of the original sample weight. The most absorbent clays are highly porous (to 65%) and contain both montmorillonite and opal. (Woodard-USGS)

RELATIONSHIPS BETWEEN MOISTURE RETENTION AND PARTICLE SIZE DISTRIBUTION OF THE SOIL,
Fort Hare Univ. (South Africa). Fakultaet Landbou.
H. V. H. Van Der Watt.
Agrochemophysica Vol 3, No 2, p 33-34, 1971.
Identifiers: Distribution patterns, Hydrometer methods, *Soil moisture, Retention, Soils, *Soil particle size, *Regression analysis.

In the soils examined, moisture retention and 'available moisture' can be estimated with fair accuracy from particle size distribution. The latter is determined by Van der Watt's (1966) hydrometer method. Data collected were subjected to multiple linear regression analysis with an IBM 1130 computer.--Copyright 1972, Biological Abstracts, Inc.

CIRCULATION PATTERNS IN LAKE SUPERIOR,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
S. L. Lien.
Ph.D. Thesis, 1973. 202 p, 3 tab, 70 fig, 64 ref, 3 append. OWRR B-009-WIS (6). 14-01-0001-1057.

Descriptors: Lakes, Mixing, *Water circulation, *Stratification, Movement, Winds, *Bathythermography, *Water temperature, *Water currents, Coriolis force, Model studies, *Lake Superior, Mathematical models, Energy transfer.
Identifiers: Keweenaw Peninsula, Isle Royale.

Lake circulation studies were directed toward Lake Superior for the purpose of broadening the quantitative understanding of large-scale circulation patterns induced by wind and atmospheric pressure variations over lakes under homogeneous conditions. The effects of lake geometry--both horizontal and depth variation--of bottom conditions--slip or no-slip--and of wind stress distributions on the movement of water are considered. Because of the large-scale water motion, Coriolis forces were included in the models. An iteration scheme is used for the numerical solution of steady-state flow conditions in a homogeneous lake, and an explicit scheme is applied to the transient flow situation. Laboratory results generated on a physical rotary, vertically distorted model of Lake Superior indicate the patterns that result from wind-generated circulation. Uniform density conditions occur in the lakes during the late fall and spring seasons. By using a diverse approach of combining many sampling techniques and methods of analysis, it was possible to detect and define the nature of the temperature and current patterns for the study area. BATHYMETRIC RECONNAISSANCE OF LAKE TAHOE, NEVADA AND CALIFORNIA,
Geological Survey, Carson City, Nev.
F. E. Rush.
Nevada Division of Water Resources, Water Resources-Information Series Report 17, 1973. 1 sheet, 6 fig, 3 tab, 8 ref.

Descriptors: *Lake morphology, Lake morphometry, *Bathymetry, *Hydrologic data, Water quality, Water temperature, Sedimentation, Inflow, Discharge (Water), Streamflow, Dam design, Water levels, Precipitation (Atmospheric), California, Nevada.
Identifiers: *Lake Tahoe (Calif and Nev).

This bathymetric map (scale 1:62,500) of Lake Tahoe in California and Nevada is based on a soundings map of the U.S. Coast and Geodetic Survey (1923). The deepest sounding in the lake, 1,646 feet and the only sounding greater than 1,600 feet, was about 6 miles due east of the Truckee River outlet and along the axis of the lake. Most of the steep slopes shown by the close spacing of the bathymetric coutours on the east and west sides of the lake are of fault origin. In addition, a fault scarp extends southwestward from Stateline Point at the north end of the lake towards the deepest point in the lake. About 2 miles north of Emerald Bay at Rubicon Point, the lake depth increases 1,300 feet in about the same horizontal distance, producing a bottom slope of about 45 deg from horizontal. Smaller maps and illustrations show general distribution of lake-bottom sediments; approximate mean annual precipitation in the Lake Tahoe basin; mean monthly flow of Upper Truckee River near Meyers, California; flow from Lake Tahoe to Truckee River; and annual variations in stage of Lake Tahoe. Summary tables are presented for lake morphometry, water temperature, water quality, light penetration, and dam-design. (Woodard-USGS)

SEISMIC SEICHES IN BAYS, CHANNELS, AND ESTUARIES,
Lamont-Doherty Geological Observatory, Palisades, N.Y.
A. McGarr, and R. C. Vorhis.
In: The Great Alaska Earthquake of 1964: Oceanography and Coastal Engineering: National Academy of Sciences, Washington, D.C., p 25-28, 1972. 2 fig, 1 tab, 3 ref.

Descriptors: *Seismic waves, *Earthquakes, *Alaska, *Seiches, Frequency, Waves (Water), Tides, Surges, Water level fluctuations, Coasts, Lakes, Rivers, Reservoirs, Seismic properties, Travel time.

The great Alaska earthquake of 1964 produced seismic waves so large that they set bodies of water into oscillation throughout much of North America. Seismic surface waves, of both Love and Rayleigh types, were primarily responsible for the oscillations, or seiches, because these generally cause the largest amplitude of ground motion of all seismic waves at great distances from an epicenter. As the seismic surface waves passed beneath water-filled basins, their horizontal components generated the seiches. The surface waves most effective in the production of seiches had periods of the order of 15 seconds (or wavelengths of about 50 km). The distribution of seismic seiches in coastal regions is described and some features of the distribution are explained. A map shows seismic seiches from the Alaska earthquake recorded in conterminous United States. (Woodard-USGS)

RESERVOIR BANK STORAGE,
Geological Survey, Menlo Park, Calif.
T. H. Thompson.
Available from NTIS, Springfield, Va 22151, as PB-214 416. Price $3.00 printed copy; $0.95 microfiche. Computer Contribution No 24, November 1972. 29 p, 1 fig, 5 ref, 2 append.

Descriptors: *Reservoir storage, *Hydrologic data, *Water level fluctuations, *Reservoirs, *Model studies, Computer models, Input-output analysis, Water inflow, Discharge (Water), Water yield, Hydrologic budget, Bank storage, Surface-groundwater relationships.
Identifiers: FORTRAN language.

A digital computer program is presented for computing daily bank storage from changes in reservoir surface elevations where the reservoir is bounded by a wedge-shaped aquifer of finite width. Cumulative bank-storage volumes are computed for two sets of transmissivity and storage coefficients. Each set is multiplied by a constant selected by the user and the volumes are then combined. A table of daily reservoir elevations, changes in elevations, changes in bank-storage volume, and total cumulative bank-storage volume at the end of each day is printed. A listing of the computer program is given at the end of the report along with sample input data and program output. (Woodard-USGS)

Descriptors: *Forecasting, *Inflow, *Reservoirs, *Reservoir storage, Water storage, Discharge (Water), Soil moisture, Field capacity, Watersheds (Basins), Channels, Tributaries, Monthly, Curves.
Identifiers: *Ukraine, *Dnieper River.

Investigations to develop predictive relations for average quarterly discharges (in monthly increments) of inflow to the Kiev, Kanev, and Kremenchug Reservoirs for the last quarter of one year and the first quarter of the next were based on calculated relations constructed from data for 1933-40 and 1944-68. The factors used were water storage in the basin and water storage in the channel at the end of the preceding quarter. The relations examined for the Kiev and Kanev Reservoirs can be used to prepare sufficiently accurate forecasts of quarterly inflow in monthly increments for the fourth quarter but only tentative forecasts of inflow for the first quarter. For the Kremenchug Reservoir, sufficiently accurate forecasts of tributary inflow for the fourth quarter can be prepared, although use of these forecasts is considered inexpedient, since this inflow is small with respect to main-stream flow. SEASONAL EMERGENCE OF SOME HIGH ARCTIC CHIRONOMIDAE (DIPTERA),
Waterloo Univ. (Ontario). Dept. of Biology.
H. V. Danks, and D. R. Oliver.
Can Entomol, Vol 104, No 5, p 661-686, 1972. Illus.
Identifiers: *Arctic, *Chironomidae, Diapause, *Diptera, Seasonal, Synchronized, Temperature.

The annual emergence of 11 chironomid species from shallow ponds in the area of Hazen Camp (81 degree 49'N, 71 degree 18'W) is considered. Features of emergence are very similar in all these arctic species, although different species emerge at slightly different times in the same habitat. In the deeper habitats, emergence from a deep site is slightly later than that from a shallower one in the same pond. There are very marked differences in times of emergence from pond to pond: emergence of 50% of the annual total for a given species may be reached in different ponds up to 3 wk apart. These differences from habitat to habitat mean that adults are present over the general Hazen area throughout the arctic summer. The time at which emergence begins in a given pond (or given site within a deeper pond) is primarily dictated by the temperature required for preemergence development, but also by other features of individual ponds. Pond temperatures near 4 or 5 C are most important in this respect. The time of first emergence differs between years in the same pond according to year-to-year temperature differences. Emergence of a given species is basically highly synchronized within a pond, but the emergence period may be prolonged by lowered temperatures acting as a threshold for adult emergence at about 7 C. The emergence pattern is less regular in shallow ponds in which the temperature fluctuates greatly, and it is more regular with lower peaks in deeper ponds. Males of a number of species generally emerge slightly before the females. Aquatic insect species are characterized as absolute spring species if all potential emergents overwinter as mature larvae (i.e., larvae in which no further growth is necessary before emergence) and also 'diapause' is present at this stage. To this category all of these high arctic species belong. They are apparently derived from 'absolute spring species' farther south, the life-cycles of which are preadapted to the shortness of the arctic season. Despite the potential for highly synchronized emergence which such species possess, this potential is not fully realized in the arctic because the irregular fluctuations of temperature there operate near values which may directly inhibit development and emergence.--Copyright 1972, Biological Abstracts, Inc.

PARASITES OF FISH FROM LAKE OF THE WOODS, ONTARIO,
Department of Lands and Forests, Maple (Ontario). Research Branch.
A. O. Dechtiar.
J Fish Res Board Can. Vol 29, No 3, p 275-283, 1972.
Identifiers: *Canada (Onterio), *Fish parasites, *Helminths, Human health, *Lake of the Woods, Parasites.

Results of a survey of the parasite fauna of fish from Lake of the Woods and adjacent lakes are presented. Over 600 fish representing 41 species were examined, and 170 species of parasites, mostly helminths, are recorded. Every species of fish and 97% of all fish examined carried at least 1 parasite. No parasites considered hazardous to human health were found. A number of parasites, reported elsewhere as contributors to fish mortalities, are recorded.--Copyright 1972, Biological Abstracts, Inc.

WATER POTENTIALS IN NONWILTED DIANTHUS GROWN IN DIFFERENT NUTRIENT SOLUTION CONCENTRATIONS,
Washington State Univ., Pullman.
K. A. Schekel, and J. J. Hanan.
Agron J. Vol 64, No 4, p 440-443. 1972. Illus.
Identifiers: Aperture, *Dianthus-Caryophyllus-D, Evaporation, Hydrostatic potential, Nutrients, Pressure, Stomata, Transpiration, Turgor, Xylem, Osmotic potential (Plants).

Experiments were undertaken to determine if Dianthus caryophyllus L. adjusted its internal osmotic potential downward with decreasing solution potential and the concomitant effects on water and turgor potentials. Plants were grown in a gravel substrate, irrigated 2-4 times daily with solutions of varying potentials, and measurements were made from before sunrise to noon or shortly thereafter on clear days. Plant osmotic potentials adjusted to increase the potential gradient between solution and plant with decreasing solution potential. There were no observable differences between treatments with respect to stomatal aperture or leaf diffusion resistance. The xylem hydrostatic pressure decreased to a greater extent in plants grown in -1.0 bar solutions than in those grown in -0.3 bar solutions as atmospheric evaporative demand increased. Polynomial regres-

sions of potential on evaporative demand had calculated correlations exceeding 0.90. Differentiation to determine the rate of hydrostatic potential change with change in evaporative demand showed the rate to be highest at low evaporative demands in plants grown in -1.0 bar solutions, gradually decreasing to 0 at high vapor pressure differences near 16 mm Hg. Carnations in -0.3 bar solutions had rates approaching 0 at low and high atmospheric demands, with a definite maximum near 9-10 mm Hg. The differences between hydrostatic potential and plant osmotic potential, ignoring matric and xylem potentials, showed carnations in -1.0 bar solutions to have consistently lower turgor potentials than plants grown in less concentrated solutions.--Copyright 1972, Biological Abstracts, Inc.

THE RESPONSE OF NATIVE MONTANA GRASSES TO SOIL WATER STRESS,
Montana State Univ., Bozeman. Water Resources Research Center.
L. Eddleman, and T. Nimlos.
Available from the National Technical Information Service as PB-221 538, $3.00 in paper copy, $0.95 in microfiche. Publication No. 37, 1972. 30 p, 6 tab, 52 ref. OWRR A-046-MONT (3).

Descriptors: *Soil moisture, *Soil water, Soil moisture meters, Montana, *Grasses, *Moisture stress, Drought tolerance, Water requirements, Soil-water plant relationships, Root development.
Identifiers: *Root elongation, *Leaf elongation.

In central Montana the major species show differences in their site requirements. The stable communities serve to interpret the environmental conditions of the habitat. Available soil moisture is a major causal factor involved in species distribution and abundance. Water is now more indispensable to plants than is light or temperature, but it can be considered of great importance due to the involvement of water in a large number of vital functions. In regions of wet winters and dry summers especially, the soil acts as the reservoir supplying water to the plant during the growth season. Water available for plant growth is supplied as rain and snow during the wet season, and where it is not maintained during the dry season by ground water, the supply is gradually exhausted. The rate of use and time of exhaustion of the available moisture supply depends greatly on the physical and physiological characteristics of the species. By holding most environmental factors (light, temperature, soil characteristics, and photoperiod) approximately constant, the effects of the available soil moisture can be observed. This study was designed to monitor root elongation and leaf elongation of three grass species while growing in soils with favorable moisture conditions (control) and soils with decreasing soil water potential (treatment) brought about by the use of a nonrenewable moisture supply. FLUVIAL SEDIMENT IN SIXMILE CREEK SUBWATERSHED 6, NEAR CHISMVILLE, ARKANSAS,
Geological Survey, Little Rock, Ark.
H. R. Fancher, Jr.
Open-file report, 1971. 26 p, 9 fig, 7 tab, 4 ref.

Descriptors: *Sediment load, *Trap efficiency, *Arkansas, Sedimentation, Reservoir silting, Sediment yield, Bed load, Suspended load, Sands, Particle size.
Identifiers: *Sixmile Creek (Chismville Ark).

Fluvial sediments were measured in Sixmile Creek, Arkansas. From 1957 to 1970, 4,288 tons of suspended sediment discharged from subwatershed 6. During this time the average annual runoff was about 13.2 inches. Most of the sand carried into the reservoir was retained. The highest measured inflow-sediment concentration was 10,300 mg per liter. The highest measured outflow-sediment discharge was 49 tons. The trap efficiency of reservoir 6 was about 95% for the 14-year period of the study. (Knapp-USGS)

AN INVENTORY OF SUSPENDED SEDIMENT STATIONS AND TYPE OF DATA ANALYSIS FOR PENNSYLVANIA STREAMS, 1947-70,
Geological Survey, Harrisburg, Pa. Water Resources Div.
A. N. Ott, and A. B. Commings.
Open-file report, 1972. 24 p, 4 fig, 4 ref.

Descriptors: *Suspended load, *Data collections, *Pennsylvania, Instrumentation, Hydrologic data, Measurement, Sampling.

This is a compilation of the location, period of record, sampling frequency and type of data synthesis for suspended sediment carried by Pennsylvania streams. Data concerning suspended-sediment concentrations and loads, frequency of occurrence of suspended-sediment concentrations, and long-term trends of annual suspended-sediment loads are important tools for environmental managers. These data are required background for those concerned with establishing and enforcing erosion and sedimentation control regulations and sediment concentration or turbidity standards for water-quality criteria, or those concerned with designing for adequate long-term water storage in reservoirs, or for efficient municipal and industrial plant operation. (Knapp-USGS)
W73-11083

ONSHORE-OFFSHORE SAND TRANSPORT ON DEL MONTE BEACH, CALIFORNIA,
Naval Postgraduate School, Monterey, Calif. Dept. of Oceanography.
J. D. Williamson.
Available from NTIS, Springfield, Va 22151 AD-751 595, Price $3.00 printed copy; $0.95 microfiche. M Sc Thesis, September 1972. 62 p, 10 fig, 1 tab, 22 ref, 3 append.

Descriptors: *Beach erosion, *Sediment transport, Data collections, Sedimentation, Profiles, Waves (Water), Slopes, Surf, Sampling, *California, Sands, Littoral drift.

Daily sand volume transport values were calculated at a beach profile during a 2-month period. Wave data were recorded continuously directly seaward of the profile. Tide effects were largely filtered out by use of a lunar day (24.8 hours) sampling interval. Offshore sand transport occurred in isolated events of 1- to 2-day duration, and had a maximum value of 132.5 cubic feet per foot of beach width per lunar day. Onshore transport occurred over longer intervals of up to 7 days, and had a maximum value of 47.0 cubic feet per foot per day. Onshore-offshore transport over a 24.8-hour period depends, to a first approximation, on the mean wave steepness incident upon the beach and the initial beach slope for the period. If the initial beach slope is greater than the equilibrium slope associated with the existing wave conditions, or if the profile is initially at equilibrium and the wave steepness increases, sand will be moved offshore. The closer to equilibrium the beach is, the smaller the transports. (Knapp-USGS)

ACCRETION RATES OF FRESHWATER MANGANESE DEPOSITS,
Tata Inst. of Fundamental Research, Bombay (India).
S. Krishnaswami, and W. S. Moore.
Nature Physical Science, Vol 243, No 129, p 114-116, June 18, 1973. 1 fig, 1 tab, 12 ref.

Descriptors: *Sedimentation, *Manganese, *Lakes, *Chemical precipitation, *Radioactive dating, Sedimentation rates, Bottom sediments, Radium radioisotopes.
Identifiers: *Manganese nodules.

Growth rates of manganese nodules were studied by radiometric dating techniques which, coupled

with a knowledge of their chemical composition, provide information regarding elemental deposition rates and their geochemistry in lacustrine environments. Two nodules were studied, one spherical nodule of about 2-cm diameter from Lake Alstern, Sweden, and a saucer-shaped concretion of about 2-cm thickness from Oneida Lake, New York (Dean nodule). The Ra-266 concentrations in both the nodules were very high, with a strong concentration gradient with depth. The Ra-266 activities in the nodules were much in excess compared to its parent, Th-230. The Ra-266 gradient in these concretions may be the result of radioactive decay. If this is true, the rate of accumulation of the nodules from Lakes Alstern and Oneida is only 1 to 3 mm per 1000 years, and the age of each of these nodules is about 6,500 years. (Knapp-USGS)
W73-11088

PRINCIPLES OF LANDSLIDE IDENTIFICATION FROM AERIAL SURVEY DATA (PRINTSIPY RASPOZNAVANIYA OPOLZNEVYKH PROTSESSOV PO MATERIALAM AEROFOTOS'YEMKI),
Moscow State Univ. (USSR). Chair of Gemorphology.
A. V. Sadov, and A. L. Revzon.
Vestnik Moskovskogo Universiteta, Seryia V, Geografiya, No 5, p 50-56, September-October 1972. 5 ref.

Descriptors: *Landslides, *Aerial photography, *Surveys, Remote sensing, Topography, Terrain analysis, Digital computers.
Identifiers: *USSR (Chatkal'skiy-Kuraminsky Mts.).

Identification of landslide processes from aerial photographic surveys was based on investigations in the Chatkal'skiy-Kuraminskiy mountain system in 1969-70. Identification of landslide processes has a complex hierarchical structure and is divided into a number of levels. Each level has its own alphabet of identifiable items, a list of features, and a set of gradations for these features. Results of the identification depend on technical conditions of the survey. Application of the principles of identification will increase reliability of landslide detection from aerial survey data, and the identification schemes developed will permit use of digital computers in processing the identifiable information. UPPER PERMIAN GLACIOMARINE DEPOSITS IN THE KOLYMA RIVER BASIN (VERKHNEPERMSKIYE LEDOVO-MORSKIYE OTLOZHENIYA BASSEYNA ISTOKOV R. KOLYMY),
Severo-Vostochnoe Territorialnoe Geologicheskoe Upravlenie, Magadan (USSR).
O. G. Epshteyn.
Litologiya i Poleznyye Iskopayemyye, No 3, p 112-127, May-June 1972. 6 fig, 1 tab, 52 ref.

Descriptors: *Petrology, *Sediments, *Glacial sediments, *Glacial drift, *Geologic time, Paleozoic era, Structural geology, Rocks, Detritus, Granules, Particle size, Particle shape, Climatology, Ice, River basins, Chemical analysis.
Identifiers: *USSR (Kolyma River), *Permian period, Clastic sediments, Mudstones, Siltstones, Argillites, Slump (Mass movement), Volcanism, Paleogeography.

Upper Permian glaciomarine deposits possess all of the lithologic characteristics considered descriptive of present-day glaciomarine sediments. The postulate of a moderate or moderately cold climate in Late Permian time or, at any rate, for a considerable period of Kazanian time in the northeast USSR is being substantiated by lithologic evidence. Recurrent climatic fluctuations, reflected in the geologic profile by the presence of nonglacial deposits, occurred in Atkanian time together with changes in the ice conditions of the marine basin. The Atka suite within the Ayan-Yuryakh anticlinorium in the Yana-Kolyma folded region represents an age of maximum ice movement in Late Permian time. The Upper Permian glaciomarine deposits examined are graphic illustrations of the effects which climatic factors have on terrigenous marine sedimentation. (Josefson-USGS)

PHYSICAL EROSION AND DENUDATION RATES IN CARTWRIGHT BASIN AND VICINITY, WILLIAMSON COUNTY, TENNESSEE,
Vanderbilt Univ., Nashville, Tenn. Dept. of Geology.
D. B. Smith.
Tennessee Water Resources Research Center, Knoxville, Report No 22, December 1972. 60 p, 7 fig, 4 tab, 10 ref. OWRR B-018-TENN (1). 14-31-0001-3650.

Descriptors: *Erosion, *Sedimentation, *Sedimentation rates, *Tennessee, Watershed (Basins).
Identifiers: *Cartwright Basin (Tenn), Williamson County (Tenn.), Franklin (Tenn.).

Physical erosion and denudation rates in a small carbonate stream basin were calculated from the amount of trapped sediment in farm ponds. Eight ponds within the basin and three just outside the basin yielded an average erosion rate 569 tons per square mile per year and a denudation rate 246 feet per million years (75.0 Bubnoffs). The lowest rate of sedimentation was 238 and the highest 1,180 tons/mi2/year with corresponding denudation rates from 102 to 510 ft/million years. These sedimentation rates are two to five times greater than those calculated theoretically from rates of chemical weathering and lithology. The observed sedimentation rates are believed to be enhanced by the influence of man. (Reesman-Vanderbilt)

INVESTIGATION ON ERODIBILITY AND WATER STABLE AGGREGATES OF CERTAIN SOILS OF EASTERN NEPAL,
Soil Conservation Research, Demonstration and Training Center, Chatra (Nepal).
D. C. Chakrabarti.
J Indian Soc Soil Sci. Vol 19, No 4, p 441-446. 1971.
Identifiers: Aggregates (Soil), Erodibility, *Nepal, *Soils (Forest), *Erosion ratio.

The values of certain indices of erodibility such as erosion ratio, dispersion ratio, clay ratio, etc. of the forest soils of Kosi catchment in eastern Nepal are lower than those of arable soils even though they are under unprotected forests. The forest soils contain higher percentage of water stable aggregates, organic C, Ca, P and higher exchange capacity than the arable soils. The values of E.R. (erosion ratio) tend to increase in arable soils and decrease in forest soils with increase in altitude. Besides E.R. value, other factors such as W.S. (water stable) aggregate, D.R. (dispersion ratio), organic C, etc. should be considered in erodibility studies of soils as they are closely correlated with E.R. The W.S. aggregate has been significantly correlated with water holding capacity, organic, C, P, exchangeable Ca, cation exchange capacity, C.E.C., D.R. and suspension percentage but not with clay and free iron oxide.--Copyright 1972, Biological Abstracts, Inc.

SEDIMENTATION IN THE DEEP-SEA AREAS ADJACENT TO THE CANARY AND CAPE VERDE ISLANDS,
Heidelberg Univ. (West Germany). Sediment Research Lab.
P. Rothe.
Marine Geology, Vol 14, No 3, p 191-206, March 1973. 4 fig, 8 ref.

Descriptors: *Sedimentation, *Atlantic Ocean, Bottom sediments, Provenance, Mineralogy, Sedimentation rates.
Identifiers: Canary Islands, *Cape Verde Islands.

Bottom sediments between the eastern Canary Islands and Morocco are principally of continental-shelf derivation with little material from the islands. The sediment is mostly Globigerina ooze with silt-size quartz and much clay. Clay minerals are iron-rich chlorite, illite, and smectite. Sedimentation rates are about 2-3 cm/1,000 years. The

mineralogy of the Inner Cape Verde Basin sediments studied is different from that of the Canary Islands. Quartz and dolomite are uncommon. The clay minerals are rare chlorite, almost no illite, and some smectite. Amorphus silica is abundant. Volcanic sands are mixed with the shallow-water carbonates. This sediment distribution within the Inner Cape Verde Basin reflects a combination of open marine conditions and a chain of volcanic islands forming a barrier against terrigenous sedimentation from the African continent. Average sedimentation rates are between 2 and 3 cm/1,000 years. In the Canaries the principal constituents are terrigenous. In both areas, but particularly in the Cape Verdes, sedimentation is discontinuous, because the steady accumulation of the normal marine materials is interrupted by fluxes of reworked shallow-marine sand. (Knapp-USGS)

SEDIMENTS IN THE ATLANTIC CORNER SEAMOUNTS: CONTROL BY TOPOGRAPHY, PALEO-WINDS, AND GEOCHEMICALLY-DETECTED MODERN BOTTOM CURRENTS,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
B. A. McGregor, P. R. Betzer, and D. C. Krause.
Marine Geology, Vol 14, No 3, p 179-190, March 1973. 5 fig, 1 tab, 14 ref. ONR Contract N00014-68-A-0215-0003.

Descriptors: *Bottom sediments, *Atlantic Ocean, *Sedimentation, Erosion, Provenance, Ocean currents, Suspended load.
Identifiers: Corner seamount group.

The topography in the Corner seamounts area in the western North Atlantic was studied to determine its relationship to the sedimentation pattern. The areas of anomalously thick sediment accumulation that are found on the north side of the seamounts are related to volcanic activity as well as paleocurrent and wind patterns. An irregular sediment surface has been formed by slump structures and actively eroding bottom currents. The erosion also results in high particulate iron concentrations in the bottom water. ROLE OF IRON SULFIDES IN THE ACCUMULATION OF TRACE ELEMENTS IN BLACK SEA SEDIMENTS (ROL' SUL'FIDOV ZHELEZA PRI NAKOPLENII MIKROELEMENTOV V OSADKAKH CHERNOGO MORYA),
Akademiya Nauk SSSR, Moscow. Institut Okeanologii.
I. I. Volkov, and L. S. Fomina.
Litologiya i Poleznyye Iskopayemyye, No 2, p 18-24, March-April 1972. 2 tab.

Descriptors: *Geochemistry, *Trace elements, *Sediments, *Sulfides, *Iron, Hydrogen sulfide, Pyrite, Molybdenum, Cobalt, Nickel, Copper.
Identifiers: USSR, *Black Sea.

The content of Mo, Co, Ni, and Cu was investigated in pyrite samples collected from recent deep-sea sediments in the hydrogen sulfide zone of the Black Sea. The CoO concentration in pyrite is 0.01%-0.025% (average 0.017%), and the average coefficient of accumulation in deep-water pyrite is 9.3 (3.8-15.6). The NiO concentration in pyrite is 0.041%-0.402% (average 0.15%), and the coefficient of accumulation varies between 2.6 and 40. The CuO concentration in pyrite is 0.083%-0.195% (average 0.128%), and the average coefficient of accumulation is 20.5 (14.5-33.1). Very high and absolute concentrations of MoO3 (0.023%-0.137%) occur in pyrite, and the coefficient of accumulation in the different samples varies between 8.2 and 61.4 (average 35.8). The concentrations and coefficients of accumulation of these metals are much lower in pyrite and iron sulfides of Neoeuxinic deposits than in those of recent deep-sea sediments. (Josefson-USGS)

Geokhimiya, No 3, p 323-334, March 1972. 1 fig, 3 tab, 24 ref.

Descriptors: *Sediments, *Geochemistry, *Organic matter, *Humic acids, *Chlorophyll, Pigments, Sedimentation, Sedimentation rates, Diagenesis, Facies (Sedimentary), Chemical reactions, Oxidation-reduction potential, Hydrogen sulfide, Sampling, Cores, Analytical techniques.
Identifiers: USSR, *Black Sea, *Pheophytin, Organic carbon, Sapropel.

Distribution of organic matter and its components (chlorophyll, pheophytin, and humic acids) was investigated in different facies of Black Sea sediments. Samples collected from the surface of sediments and from cores up to 3.5 m in length were taken at depths ranging from 20 to 2,140 m. Chlorophyll and pheophytin were separated by paper chromatography and determined spectrophotometrically before and after oxidation of chlorophyll. A direct relation is observed between organic carbon and the contents of humic acids and chlorophyll-like pigments in all samples. Maximum concentrations of organic carbon (up to 20%), humic acids (up to 2.5%), and pigments (up to 0.1%) were found in sapropel of paleoeuxinic sediments. Considerably smaller amounts of these compounds were found in neoeuxinic sediments and in shelf sediments laid down in oxygenated water. High concentrations of chlorophyll and pheophytin were observed in paleoeuxinic sediments. Accumulation and preservation of chlorophyll, pheophytin, and humic acids in Black Sea sediments depend on oxidation-reduction conditions in the water and bottom sediments, character of the sedimentary facies, lithology and particle-size distribution of the sediments, and the sedimentation rate. ECOLOGICAL MONITORING OF TWO BEACH NOURISHMENT PROJECTS IN BROWARD COUNTY, FLORIDA,
Florida Atlantic Univ., Boca Raton. Dept. of Zoology.
W. R. Courtenay, Jr., D. J. Herrema, M. J. Thompson, W. P. Azzinaro, and J. Van Montfrans.
Shore and Beach, Vol 40, No 2, p 9-13, October 1972. 6 fig, 6 ref.

Descriptors: *Beach erosion, *Ecology, *Coastal engineering, *Dredging, *Monitoring, Excavation, Sedimentation, Shores, Benthos.
Identifiers: Beach protection.

Surveys of biological communities within any area proposed for dredging and filling or beach nourishment and restoration should be included in every such project proposal. These surveys should be conducted by both competent biologists and engineering surveyors working as a team prior to any dredging activities. A report should result from these investigations which is submitted to the agency contracting the project, the agency approving the project, the engineering-surveying-design group, the dredging firm, and any public agency requiring a statement of environmental impact of the proposed project. Ecological monitoring should be conducted during and after every such project by both biologists and engineers, again working as a team, to advise the dredging firm on protection of reef areas by taking advantage of adequate borrow areas, to prevent direct physical destruction of reef areas, and to assure that the initial recommendations of the survey team were carried out to the best advantage for protection of natural resources and completion of the project. In no case should dredging equipment be used in such projects which, by their design, contribute to unnecessary increases in turbidity and subsequent sediment fallout. The objective is to put the fill on the beach and not at the expense of natural nearshore and offshore resources. With proper planning and monitoring, both objectives can be met. (Knapp-USGS)

SCOUR AND FILL IN TUJUNGA WASH--A FANHEAD VALLEY IN URBAN SOUTHERN CALIFORNIA--1969,
Geological Survey, Washington, D.C.
K. M. Scott.
Available from GPO, Washington, D.C. 20402 Price $0.70. Geological Survey Professional Paper 732-B, 1973. 29 p, 16 fig, 1 tab, 18 ref.

Descriptors: *Scour, *Sedimentation, *Alluvial fans, *Urban hydrology, *California, Alluvial channels, Erosion, Deposition (Sediments), Degradation (Stream), Aggradation, Graded, Floods, Urbanization.
Identifiers: *Tujunga Wash (Calif).

In Tujunga Wash in southern California, extensive scour and fill occurred during the recordbreaking 1969 floods in this 3-mile-long, partly urbanized fanhead valley. Maximums of 20 feet of net scour and 35 feet of net fill were measured. The causes of the scour and fill were (1) the unexpected yet possibly natural diversion of floodflow to a major distributary channel of the wash in which urbanization had progressed, (2) local reduction in base level which occurred when floodflow in both of the main distributary channels entered a large gravel pit, and (3) lateral scour of an aggradational surface within the wash because of natural adjustment of a distributary channel to flood discharge. Additional scour and fill were due to locally raised base level and to the natural lateral shift characteristic of channels in the broad, ephemeral washes of arid and semiarid regions. Damage at most, if not all, localities could be directly ascribed to man's disregard of natural geomorphic processes on alluvial fans and in fanhead valleys. Urban development on the unstabilized cutbank of a natural flood channel on an alluvial fan or fanhead valley is generally a poor risk. (Knapp-USGS)

SEDIMENT RECORDS OF THE SNOWY MOUNTAINS REGION, AUSTRALIA.
Snowy Mountains Hydro-Electric Authority, Cooma (Australia).

June 1972. 248 p.

Descriptors: *Sediment transport, *Turbidity, *Australia, *River basins, Data collections, Suspended solids, Sediment yield, Sediment discharge, Particle size, Sampling, Reservoirs, Bed load, Hydrologic data, Streamflow, Runoff, Vegetation, Geology, Aerial photography, Mountains.
Identifiers: *Snowy Mountains Region (Australia).

All the records are presented of suspended sediment concentration and turbidity collected by the Snowy Mountains Hydro-electric Authority in the Snowy Mountains and adjacent regions of southeastern Australia during the period 1954 to June 1969. Similar records collected by the Snowy Mountains Council, the organization responsible for the operation of the Snowy Mountains Scheme, from July 1969 to December 1971, also are included. The publication is divided into two parts: Part A contains explanatory notes on the records, and Part B contains the records within the Murrumbidgee River basin. Upper Murray River basin, and Snowy River basin. Summaries are given of the records in each basin. (Woodard-USGS)

NUMERICAL TECHNIQUES APPLIED TO PARTICLE DEPOSITION DURING SLOT FLOW,
Howard Univ., Washington, D.C. Dept. of Chemical Engineering.
T. W. Copenhaver, P. B. Deshpande, and R. E. Babcock.
Water Resources Bulletin, Vol 9, No 3, p 556-566, June 1973. 10 fig, 6 ref. OWRR B-004-ARK (5).

Descriptors: *Sedimentation, *Injection wells, *Numerical analysis, *Waste disposal wells, *Hydrofracturing, Sediment transport, Mathematical models, Underground waste disposal, Deposition (Sediments), Vixcosity, Particle size.

The process of particle sedimentation from a fluid-solid slurry while flowing through a vertical slot was studied using a mathematical model. The differential equations describing the process consist of a 1st order, nonlinear, partial differential equation and a 1st order, ordinary differential equation. These two equations are solved using a forward difference technique. Results for typical sets of system parameters are presented and discussed. The model has practical applications in solid-waste disposal processes and in petroleum reservoir stimulation processes. The deposited particles quickly form a trapezoidal-shaped bank. This bank then builds essentially upward, not longitudinally, until the equilibrium height of the bank is reached. At this time, the bank exists essentially as a rectangle. Continued injection causes the bank to grow longitudinally creating a right trapezoid with its axis horizontal instead of vertical. The longitudinal point at which the bank quits building upward and begins to build longitudinally has been designated as the 'pinch point.' This point represents the carrying capacity of the slurry because it is at this point that the concentration of particles of the leading slurry front becomes zero due to deposition. The slope of the concentration versus length profile appears to be linear up to this point. Small particle diameters, high viscosity, and high injection rates cause the pinch point to occur at a point far removed from the injection point. Large particle diameters, low viscosity, and small injection rates cause the pinch point to occur near the injection point. (Knapp-USGS)

EFFECTS OF ROADWAY AND POND CONSTRUCTION ON SEDIMENT YIELD NEAR HARRISBURG, PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
L. A. Reed.
Geological Survey open-file report, August 1971. 14 p, 7 fig, 4 ref.

Descriptors: *Sediment yield, *Road construction, *Ponds, *Pennsylvania, *Sediment transport, Streams, Environmental effects, Sedimentation rates, Land development, Correlation analysis, Engineering structures, Excavation, Erosion.
Identifiers: *Harrisburg area (Penn).

The effects are shown which the construction of half a mile of one-lane roadway during June-August 1970 and construction of a 5-acre pond during August and September 1970 had on sediment concentrations and sediment discharge of a stream draining an area of 0.76 square mile near Harrisburg, Pennsylvania. The effects of the construction are shown by comparing the data collected from the affected basin with data collected from a similar adjacent basin, unaffected by construction. During the pond construction, base-flow sediment concentrations increased from 6 mg/liter to an average of 35 mg/liter. Sediment discharge during June through December 1970 attributable to the construction was 55 tons, two-thirds of the amount normally expected during a year. (Woodard-USGS)

THE THERMAL CONDUCTIVITY OF PURE WATER AND STANDARD SEA WATER AS A FUNCTION OF PRESSURE AND TEMPERATURE: PART II--PURE WATER,
Naval Ship Research and Development Center, Bethesda, Md.
V. J. Castelli, and E. M. Stanley.
Available from NTIS Springfield, Va 22151 AD-751 025 Price $3.00 printed copy; $0.95 microfiche. Report 3566-II, October 1972. 8 p, 5 fig, 5 tab, 11 ref.

Descriptors: Thermal conductivity, *Bodies of water, *Water temperature, *Water pressure, Correlation analysis, Analytical techniques, Measurement, Methodology, Data collections, Research equipment.
Identifiers: Pure water.

Observations were made of the thermal conductivity of pure water for the pressure range of atmospheric to 1400 bars and temperatures from 0 deg to 30 deg C. Two distinct series of measurements were conducted by utilizing different thermocouple junctions. Each series consisted of at least three determinations of each data point and many determinations of selected reference data points, primarily at 10 and 25 bars pressure. In almost all cases, the data resulting from any particular series agreed to within 0.2% of the mean value. Direct comparison of the data are tabulated. (Woodard-USGS)

WATER RESOURCES DATA FOR ALABAMA, 1970: PART 2. WATER QUALITY RECORDS.
Geological Survey, University, Ala.

Basic-data report, 1970. 94 p, 1 fig, 2 tab, 6 ref.

Descriptors: *Water quality, *Surface waters, *Alabama, *Chemical analysis, Basic data collections, Streams, Streamflow, Flow rates, Sediment transport, Particle size, Sediment yield, Water temperature, Sampling.
Identifiers: *Water quality records (Ala).

Water quality data are presented for surface waters in Alabama for the 1970 water year. Data for a few water quality stations in bordering States are also included. Water quality information is presented for chemical quality, fluvial sediment, and water temperaztures. The chemical quality includes concentrations of individual dissolved constituents and certain properties or characteristics such as hardness, sodium-absorption-ratio, specific conductance, and pH. Fluvial sediment information is given for suspended-sediment discharges and concentrations and for particle-size distribution of suspended sediment and bed material. Water temperature data represent once-daily observations except for stations where a continuous temperature recorder furnishes information from which daily minimums and maximums are obtained. CHARACTERISTICS AND ENVIRONMENTAL QUALITY OF SIX NORTH SHORE BAYS, NASSAU AND SUFFOLK COUNTIES, LONG ISLAND, NEW YORK,
State Univ. of New York, Stony Brook. Marine Science Research Center.
M. G. Gross, D. Davies, P. M. Lin, and W. Loeffler.
Technical Report Series No 14, January 1972. 98 p, 21 fig, 20 tab, 30 ref, append.

Descriptors: *Water quality, *Bays, *New York, Environmental effects, Chemical properties, Physical properties, Surveys, Sampling, Data collections, Regression analysis, Correlation analysis, Evaluation, Classification, Ecology, Dissolved oxygen, Sediments, Drainage area, Inflow, Geology, Climate, Tidal effects, Storms, Water circulation.
Identifiers: Hempstead Harbor (N Y), Huntington Harbor (N Y), Little Neck Bay (N Y), Mt. Sinai Harbor (N Y), Port Jefferson Harbor (N Y).

Environmental studies of six bays on the north shore of Long Island provide data needed for long-range planning. Three environmental quality indicators were developed: present indicators, integrative indicators, and predictive indicators. Present indicators are based on data from the survey of water quality (e.g. dissolved oxygen). Integrative indicators are based on data from the survey of bottom deposits (e.g. loss on ignition). Predictive indicators are based on a number of factors: basic characteristics of the north shore bays (e.g. regional setting, drainage basins, geology, climate, tides, water circulation, storms); present water quality; and past water quality trends. By combining knowledge of present conditions and past trends with probable future processes, predictive indicators can be formulated. Based on present indicators the bays and harbors are ranked: (1) Manhasset Bay (worst); (2) Hempstead

Harbor; (3) Huntington Harbor; (4) Port Jefferson Harbor; (5) Little Neck Bay; and (6) Mt. Sinai Harbor (best). Based on integrative indicators the bays and harbors are ranked: (1) Manhasset Bay (worst); (2) Huntington Harbor; (3) Hempstead Harbor; (4) Little Neck Bay; (5) Port Jefferson Harbor, and; (6) Mt. Sinai Harbor (best). Based on predictive indicators the bays and harbors are ranked: (1) Huntington Harbor (worst); (2) Manhasset Bay; (3) Hempstead Harbor; (4) Mt. Sinai Harbor; (5) Port Jefferson Harbor; and (6) Little Neck Bay (best). (See also W73-11109) (Woodard-USGS)

SURVEY OF WATER QUALITY AND SEDIMENTS IN SIX NORTH SHORE BAYS, NASSAU AND SUFFOLK COUNTIES, LONG ISLAND, NEW YORK (APPENDIX TO TECHNICAL REPORT NO. 14),
State Univ. of New York, Stony Brook. Marine Sciences Research Center.
M. G. Gross, D. Davies, P. M. Lin, and W. Loeffler.
Technical Report Series No 15, February 1972. 29 p, 16 fig, 4 tab, 6 ref.

Descriptors: *Water quality, *Bays, *New York, Chemical properties, Physical properties, Data collections, Sampling, Boats, Water analysis, Sediments, Chemical analysis, Analytical techniques.
Identifiers: Hempstead Harbor (N Y), Huntington Harbor (N Y), Little Neck Bay (N Y), Mt. Sinai Harbor (N Y), Port Jefferson Harbor (N Y).

This appendix presents water quality and sediment data collected in Little Neck Bay, Manhasset Bay, Hempstead Harbor, Huntington Harbor, Port Jefferson Harbor, and Mt. Sinai Harbor, New York, during the period May-December, 1971. The Surveys, sponsored by the Nassau-Suffolk Regional Planning Board, were part of a project designed to establish physical and chemical criteria for assessment of environmental quality in the bays (MSRC Technical Report Series No. 14, Gross et al, 1972). Presented are the sampling procedures and analytical techniques used in the surveys. The cruises are outlined in tables. Figures indicative of the entire body of data (which is stored at the Marine Sciences Research Center) are presented. (See also W73-11108) (Woodard-USGS)

SURVEY OF APPLICATION OF RADIATION TO PREPARATIVE CHEMISTRY,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
W. H. Philipp.
Available from NTIS, Springfield, Va 22151 as NASA TN D-7285, Price $3.00 printed copy; $0.95 microfiche. Note TN D-7285, May 1973. 32 p, 5 tab, 54 ref.

Descriptors: *Radiation, *Chemical reactions, *Aqueous solutions, Synthesis, Metals, Methodology, Oxidation, Reduction (Chemical), Ionization, Irradiation, Inorganic compounds, Organic compounds, Solvents.
Identifiers: Synthetic chemical compounds.

The use of radiation for preparative chemistry in liquid solutions is outlined. General principles are presented, and preparations involving reduction, oxidation, polymerization, and decomposition are given. The use of various solvents, water, inorganic liquids, and organic liquids, is discussed. Finally, a commentary is made on some specific applications where radiation chemistry as a preparative technique may be useful. Much of the discussion is based on extrapolation of existing radiochemical data which entails some speculation. At present, the use of radiation for this purpose is limited to the preparation of laboratory quantities of high purity materials and to the synthesis of compounds that cannot be readily prepared by ordinary chemical means. An exception is when chain or autocatalytic processes are involved which result in high energy yields of product; in this case, radiation may be used for larger production. (Woodard-USGS)

INFLUENCE OF WEATHERING ON EFFECTIVE VALUES OF SHEAR STRENGTH OF MIOCENE CLAY,
J. Herstus.
In: Proceedings of the 4th Budapest Conference on Soil Mechanics and Foundation Engineering, A. Kezdi, editor, October 12-15, 1971, Hungary: Academiai Kiado, Budapest, p 135-142, 1971. 4 fig, 3 tab, 9 ref.

Descriptors: *Weathering, *Soil strength, *Clays, *Consolidation, Shear, Porosity, Leaching, Plasticity, Liquid limits, Mineralogy, Clay minerals, Compressive strength, Soil structure.
Identifiers: *Bohemia (Czechoslovakia).

In miocene clays from Northwest Bohemia there are four weathering zones. Analysis of the behavior in shear strength tests of clays from individual weathering zones supplemented by microscopic study of the structures demonstrates that weathering breaks up the original structures into individual aggregates of clay particles and produces fairly large pores. In weathering zone III the aggregates have been subsequently sealed with hydroxides of iron, and the behavior of the originally overconsolidated soil approximates the behavior of soils with metastable structure. Further intensive weathering in zone IV distrubs the diagenetic bonds produced by the hydroxides, and the clay behaves here like a normally consolidated or slightly overconsolidated soil. SIMULTANEOUS TRANSPORT OF CHLORIDE AND WATER DURING INFILTRATION,
California Univ., Davis. Dept. of Water Science and Engineering.
C. Kirda, D. R. Nielsen, and J. W. Biggar.
Soil Science Society of America Proceedings, Vol 37, No 3, p 339-345, May-June 1973. 7 fig, 1 tab, 27 ref.

Descriptors: *Leaching, *Diffusion, *Chlorides, *Infiltration, Mass transfer, Convection, Dispersion, Path of pollutants, Mixing, Soil water movement, Water chemistry, Tracers, Tracking techniques, Radioisotopes.
Identifiers: Chloride transport.

Displacement of chloride during infiltration was studied using soil columns for two cases: chloride initially spread on the soil surface; and chloride initially mixed with the soil. Chloride was applied as CaC12 labeled with C1-36. In conjunction with chloride activity measurement, gamma-ray attenuation measurement was used for monitoring the water content distribution during the simultaneous flow of chloride and water. Treatments included different levels of initial soil water content and different levels of water saturation at the soil surface during infiltration. The equations describing vertical water flow and miscible displacement of chloride were solved numerically. Experimental and calculated chloride distributions were in agreement. Chloride apparent diffusion coefficients estimated for pore water velocities less than 0.01 cm per min were nearly equal to those for molecular diffusion only. Initial soil water content did not influence the depth of chloride displacement for a given quantity of water infiltrated. Keeping the water content at the soil surface below saturation resulted in a deeper and more complete displacement of chloride. (Knapp-USGS)

M. J. Fishman, and D. E. Erdmann.
Analytical Chemistry, Vol 45, No 5, p 361R-403R, April 1973. 630 ref.

Descriptors: *Metals, *Analytical techniques, *Water analysis, Analysis, Trace elements, Heavy metals, Alkali metals, Mercury, Lead, Cadmium, Gold, Silver, Nickel, Chemical analysis, Separation techniques, Sampling, Spectrophotometry, Gas chromatography, Detergents, Chromatography, Laboratory equipment, Halides, *Reviews, *Bibliographies.
Identifiers: *Atomic absorption spectroscopy.

This biennial review of methods of water analysis covers the literature from October 1970 through September 1972. Over six hundred references from major journals in the world are cited. Recent developments in the following analyses are included: alkali metals; hardness, alkaline earth metals; aluminum, iron, manganese, chromium, rhenium, cerium, and titanium; copper, zinc, lead, cadmium, nickel, cobalt, and tin; mercury, silver and gold; vanadium, molybdenium, scandium, antimony, bismuth, uranium, and rare earths; selenium, boron, arsenic, phosphorus, and silica; and halides. Organics, sulfur and nitrogen compounds, oxygen parameters, detergents and miscellaneous determinations are covered in more detail. (Oleszkiewicz - Vanderbilt)

SOME ASPECTS OF THE GEOCHEMISTRY OF MARINE AEROSOLS,
Centre National de la Recherche Scientifique, Gif-sur-Yvette (France). Centre des Faibles Radioactivities.
R. Chesselet, J. Morelli, and P. B. Menard.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 93-114, 1972. 13 fig, 3 tab, 71 ref.

Descriptors: *Aerosols, *Water chemistry, *Sea water, *Sea spray, Sodium, Chlorides, Hydrologic cycle, Potassium, Magnesium, Calcium.
Identifiers: *Marine aerosols.

A considerable proportion of the salts dissolved in rivers has a marine origin. These salts arise from the injection of particles into the atmosphere at the surface of the oceans; they fall out, subsequently, onto the continents, and are then carried back to the oceans by rivers. The relative proportions of the principal ionic constituents in seawater are never found in the atmosphere or in precipitations. The weight ratios between chlorine, sodium, potassium, and calcium seem to reflect an enrichment process for potassium and calcium, with respect to sodium. The source of gaseous chlorine in the atmosphere is the release above the ocean of gaseous chlorine, probably as HCl, at the expense of particulate chlorine. Concentrations of gaseous chlorine of marine origin above the lands seem to be controlled by a slow combination of this chlorine with the terrigenous environment. This loss balances a supply of oceanic gaseous chlorine of about 200 million tons per year. (See also W73-11367) (Knapp-USGS)

Descriptors: *Carbon dioxide, *Water chemistry, *Climatology, *Carbon cycle, Sea water, Tracers, Carbon radioisotopes, Carbonates, Oceans.
Identifiers: *Carbon dioxide cycle.

Carbon dioxide plays a role in the radiation budget of the atmosphere. The fluctuations of this gas, due either to natural or manmade causes, must be predicted and understood before forecasts of climate modification can be undertaken. The three reservoirs through which carbon exchanges are the atmosphere, the biosphere, and the oceans. Prediction of atmospheric carbon dioxide depends on the input of carbon dioxide from the combustion of fossil fuels, the exchange between reservoirs, the exchanges within parts of each reservoir, and the stability of each reservoir. Despite uncertainties in the true seasonal variation of biospheric uptake and release of carbon dioxide to the atmosphere, the biosphere is dominant in seasonal variation. The oceans have a smaller effect even in the southern hemisphere with its large water area. In fact, the oceans, if important for this purpose, would produce the opposite changes in atmospheric carbon dioxide from those observed, because of seasonal temperature variations. The reasons for the lesser role of the oceans may be slow response time to temperature changes and the compensating effects of the marine biosphere. (See also W73-11367) (Knapp-USGS)

THE CHEMICAL STABILITY OF THE OCEANS AND THE CO2 SYSTEM,
Oregon State Univ., Corvallis. Dept. of Oceanography.
R. M. Pytkowicz.
In: The Changing Chemistry of the Oceans; Proceedings of the 20th Nobel Symposium, August 16-20, 1971, Goteborg, Sweden: Wiley Interscience Division of John Wiley and Sons, Inc., p 147-152, 1972. 2 fig, 8 ref. NSF Grant GA-17011.

Descriptors: *Water chemistry, *Sea water, *Equilibrium, *Kinetics, Carbon dioxide, Hydrogen ion concentration, Chemical reactions, Chemical potential.
Identifiers: *Steady-state chemistry.

As an alternative mechanism to equilibrium for chemical stability of ocean water, the steady state is reasonable in stationary open systems with gradients of chemical potential. Equilibria and steady states may coexist in the oceans. Steady states require only that the net input and output rates of reservoirs be equal and are, therefore, less restrictive than equilibria for which the net rates must be zero. Simple first order models are used to deduce the general conditions which lead to an equilibrium or to a steady state ocean and to suggest more complex models and the types of data needed to treat geochemical systems quantitatively. A steady state ocean will occur in chemical systems in which the weathering reservoir on land is not seriously depleted within the time scale of interest, whether the systems in the oceans are controlled by biological or by mineral equilibration processes. Dissolved $CaCO_3$ is not at equilibrium with the solid phase, and the removal of alkalinity is biogenic. Therefore, the alkalinity of the oceans appears to be in steady state. The pCO_2 of seawater below the thin wind mixed layer is controlled by oxidation rather than by near equilibrium with the atmosphere. The pH is determined by any two relevant quantities. Thus, if the alkalinity and the pCO_2 of seawater are at a steady state controlled by life processes, then so is the pH. (See also W73-11367) (Knapp-USGS)

CALCITE SATURATION IN AN EASTERN KENTUCKY KARST STREAM,
Kentucky Univ., Lexington. Dept. of Geology.
D. P. Beiter.
M Sc Thesis, 1970. 75 p, 12 fig, 6 tab, 5 append. OWRR A-009-KY (3).

Descriptors: *Limestones, *Sedimentary rocks, *Calcite, *Kentucky, Water quality, *Groundwater, Caves, Streams, Sampling, Water Chemistry, Chemical analysis, Karst, Dissolved solids, Analytical techniques.
Identifiers: Dissolved calcite.

Meteoric water entering a body of limestone is capable of dissolving appreciable amounts of rock over long periods of time. Since in many limestone bodies, the only available water supply is from openings produced by solution, it is of interest to know the location and rate of such solution. One approach is to determine the capability of the water at any point to further dissolve calcite, the main constituent of limestone. Cave Hollow is a

hanging karst valley in Lee County, Kentucky, approximately halfway between Irvine and Beattyville. The caves of the Cave Hollow System are excavated in Mississippian limestone which is overlain by Pennsylvanian shales and sandstones, and underlain by Mississippian siltstones and shales. The entire valley is about 2.6 km long and 1.2 km wide and is floored by the limestone. Local relief is about 150 m. Streams heading on the Pennsylvanian clastics flow towards the limestone and sink near the contact. All water emerges from a spring near the mouth of the valley. Samples were collected at various points of the Cave Hollow System between March and December 1968. Two types of conclusions were made from the study. First are those concerning the chemistry of the system. Second are those concerning the methods and the directions of needed future inquiry. (Woodard-USGS)

Identifiers: USSR, *Mediterranean Sea, Sea of Marmara, Organic carbon, Vanadium, Tungsten.

The Mo content in the eastern part of the Mediterranean Sea is high, amounting to 10.9-17.7 micrograms of Mo03/liter. The vertical distribution of Mo in the sea water is uniform and is typical of other normally aerated basins. In the Sea of Marmara, the slight decrease in Mo concentration in the surface layer is due to the influence of fresh Black Sea waters, and the Mo03 concentration in the sediments varies between 0.00019% and 0.0080%. In sediments with an oxygen regime, maximum Mo concentrations are confined to layers rich in manganese hydroxide. There is a clear correlation between Mo and organic carbon in the reduced sediments. DIRECT DETERMINATION OF THE ELECTROMAGNETIC REFLECTION PROPERTIES OF SMOOTH BRACKISH WATER TO THE CONTINUOUS SPECTRUM FROM 100 MILLION TO 4 BILLION HERTZ,
Hawaii Univ., Honolulu. Water Resources Research Center.
L. K. Lepley, and W. M. Adams.
Available from the National Technical Information Service as PB-221 372, $4.85 in paper copy, $0.95 in microfiche. Technical Report No 48, May 1971. 86 p, 36 fig, 50 ref, append. OWRR-B-015-HI (5).

Descriptors: *Remote sensing, Radio waves, Microwaves, *Brackish water, *Electromagnetic waves, *Salinity, Pollutants, Estuaries, *Hawaii, Springs, Roughness (Hydraulic), Reflectance, Radar, Waves, Chlorinity, Dispersion.

Computer-generated frequency dispersion curves were constructed of (1) the dielectric coefficients, (2) power reflectance, (3) brightness temperature, and (4) skin depth of water as a function of eight different normalities of sodium chloride corresponding to a salinity range from pure to ocean water, and as a function of five different temperatures from 0C to 40C to the radio frequency range from 1,000,000 to 3 x 10 to the 10th power Hertz. These graphs indicate that the frequency dispersion of the reflectance of radio energy in the 1,000,000 to 10 to the 9th power Hertz band at normal incidence to a smooth water surface is strongly influenced by the salinity of the water, and that the spectral signature could be used as a measure of water salinity as distinguished from water temperature. Reflectance spectra from 2.5 x 10 to the 9th power to 4.0 x 10 to the 9th power Hertz of fresh and sea water were obtained with a free-wave (horn antenna and pool) system and reflectance spectra of brackish and sea water from 10 to the 8th power to 2.0 x 10 to the 9th power Hertz and of fresh water from 0.8 x 10 to the 9th power to 2 x 10 to the 9th power Hertz were obtained with a coaxial waveguide system. The measured spectral signatures appear to agree with the computed reflectance of aqueous sodium chloride solutions. The theoretical and experimental results indicate that free-wave radio reflectance spectrometry from 1,000,000 to 10 to the 9th power Hertz is feasible for use in remote sensing of salinity of fresh and brackish water outflows onto sea water.

COASTAL DYNAMICS ALONG MUSTANG ISLAND, TEXAS,
Western Michigan Univ., Kalamazoo.
R. A. Davis, Jr., and W. T. Fox.
Available from NTIS, Springfield, Va. 22151 AD-750 756; Price $3.00 printed copy; $0.95 microfiche. Technical Report No 9, October 1, 1972. 68 p, 29 fig, 14 ref, append. ONR Contract N00014-69-C-0151.

Descriptors: *Hydrodynamics, *Coasts, *Islands, *Gulf of Mexico, *Texas, Beach erosion, Shores, Data collections, Shore protection, Topography, Winds, Velocity, Ocean waves, Currents (Water), Storms, Sand bars, Correlation analysis, Lake Michigan, Environmental effects, Time series analysis.
Identifiers: Mustang Island (Tex).

Two modified time-series studies were conducted along the Mustang Island, Texas coast during October-November, 1971 and January-February, 1972. Patterns exhibited by variations in monitored environmental variables show interrelationships that are quite comparable to those observed in eastern Lake Michigan. The dominating factor in controlling coastal processes along the Texas coast is barometric pressure. Large-scale fluctuations occur as cold fronts ('northers') move through the area in an offshore direction. Changes in wind direction and velocity, breaker height, and longshore current direction and velocity accompany the passage of these fronts. The responses of beach and nearshore topography to these changes are also much like those observed in Lake Michigan. High energy conditions created by the passage of fronts cause seaward displacement and planation of the sand bar, whereas quiescent conditions permit slow shoreward migration and buildup of the sand bar. Rip currents are commonly present and may cut channels in the sand bar; however, changes in bar location and form do not show the cyclic pattern observed in Lake Michigan. (Woodard-USGS)

HYDRAULIC MODEL MEASUREMENTS OF TIDAL CURRENTS AROUND CAPE HENLOPEN, DELAWARE,
Delaware Univ., Newark, Coll. of Marine Studies.
B. T. Lakshman, and F. E. Camfield.
Available from NTIS, Springfield, Va 22151 AD-752 478; Price $3.00 printed copy; $0.95 microfiche. Technical Report No 15, July 1972. 79 p, 10 fig, 5 tab, 27 ref, append. ONR-GP Contract N00014-69-A0407.

Descriptors: *Deposition (Sediments), *Shoals, *Coasts, *Sediment transport, *Delaware, Model studies, Tidal effects, Channel morphology, Harbors, Correlation analysis, Ocean currents, Tides.
Identifiers: *Cape Henlopen (Del).

Cape Henlopen, Delaware, is advancing to the north and west at the rate of approximately 12 ft per year. A harbor developed in the Cape Henlopen area in the early 1800's has since shoaled with sediment moved by currents. A study was made to investigate the feasibility of using a hydraulic model for measuring tidal currents around Cape Henlopen. The model 4 ft x 4 1/2 ft reproduced an area of about 23.2 square miles. A rocking tray constructed for the study is described. A separate open channel experiment was conducted for simulating bottom roughness through friction elements. A comparative study between measured model currents and prototype currents shows that a small-scale distorted hydraulic model can be used for measuring tidal currents. The model measurements of tidal currents indicate the possible reasons for shoaling of Breakwater Harbor and the advance of Cape Henlopen. (Woodard-USGS)

RESEARCH AND THE PROBLEMS OF TWO SEAS,
P. G. Sly.
In: Oceans Ontario. Technical Sessions. April 22, 1972, James Allister MacInnes Foundation, Toronto, Ontario, Canada. p 1-15, (1972).

Descriptors: *Bays, Hydrography, *Bathymetry, Temperature, *Salinity, *Mixing, *Diffusion, *Ice, Environmental effects, Exploitation, Oil industry, Mineral industry, Gases, Fish, Waste disposal, Dredging, Erosion, Landfills.
Identifiers: *James Bay, *Hudson Bay.

The physical conditions of the James and Hudson bays are described. Both bays are in good condition, warmer waters reflect seasonal warming in shallow areas, low salinities nearshore reflect river inflow, and oxygen levels are indicative of the mixing and diffusion expected from the bathymetry of the bays. Ice conditions were examined. The possible effects of the following are discussed: oil, gas, mineral, and fish exploitation; waste disposal; dredging; erosion; shore construction; fill operations; and thermal pollution. THE USE OF MODERN CHROMIUM ACCUMULATIONS TO DETERMINE ESTUARINE SEDIMENTATION RATES,
New Hampshire Univ., Durham. Jackson Estuarine Lab.
J. M. Capuzzo, and F. E. Anderson.
Marine Geology, Vol 14, No 3, p 225-235, March 1973. 4 fig, 1 tab, 29 ref.

Descriptors: *Sedimentation rates, *Estuaries, *Chromium, *Tracers, *New Hampshire, Sedimentation, Sampling, Chemical analysis, Path of pollutants, Industrial wastes, Tannery wastes, Organic matter.
Identifiers: Great Bay estuary (NH).

To estimate the sedimentation rate and effect of chromium pollution in the Great Bay estuary of New Hampshire, cores were taken and analyzed for chromium content, size fractions, and combustible matter. These values were correlated to distinguish between natural and artificial or enhanced levels of chromium. The results indicate that chromium is accumulating in higher than natural levels in the upper reaches of the estuary and may be used as an indicator species to estimate sedimentation rates. VOLUME TRANSPORT, SALINITY DISTRIBUTION AND NET CIRCULATION IN THE DUPLIN ESTUARY, GEORGIA,
Georgia Univ., Sapelo Island. Marine Inst.
B. Kjerfve.
Available from National Technical Information Service as PB-221 535, $3.00 in paper copy, $0.95 in microfiche. Environmental Resources Center, Georgia Institute of Technology Report ERC-0273, April 1973, 30 p, 22 fig, 10 ref. OWRR B-035-GA (2), 14-01-0001-1892.

Descriptors: *Estuaries, *Salinity, Salt Marshes, *Georgia, *Water circulation, *Tidal waters, Saline water intrusion.
Identifiers: *Duplin River estuary (Geo.), Volume flow.

A field study during one tidal cycle in the Duplin River estuary, Georgia indicated a net up-river volume transport. It is thought that some of the Duplin water, which during high tides floods the surrounding marsh, drained off to nearby creeks when the tide falls. There is no apparent source of fresh-water along the river, yet the salinity distribution in a longitudinal section is found to decrease toward the head. The cause is believed to be ground water entering the river. Although the longitudinal net salt distribution matches the Chesapeake Bay estuaries, the lateral distribution is opposite. The time-averaged velocity data indicate a complex circulation. The longitudinal net flow at one cross section was two-layered in the middle but one- and three-layered along the eastern and western sides, respectively. (James-Georgia)

LIVING FORAMINIFERIDS OF TIDAL MARSHES: A REVIEW,
Bristol Univ. (England). Dept. of Geology.
J. W. Murray.
J Foraminiferal Res. Vol 1, No 4, p 153-161. 1971. Illus.
Identifiers: *Foraminiferids, Marshes, Miliolina, *Reviews, Rotalinia, Textulariina, *Tidal marshes.

Tidal marshes can be differentiated according to their water characteristics: hyposaline, normal marine, hypersaline. The living foraminiferid assemblages of all marshes have very low diversity. Hyposaline marshes have high Textularina, some Rotaliina and generally an absence of Miliolina. Normal marine and hypersaline marshes are characterized by the presence of all 3 suborders. The principal species are cosmopolitan. Marsh assemblages are readily separated from those of lagoons and shelf seas.--Copyright 1972, Biological Abstracts, Inc.

SAND MOVEMENT ALONG CARMEL RIVER STATE BEACH, CARMEL, CALIFORNIA,
Naval Postgraduate School, Monterey, Calif.
B. F. Howell.
Available from NTIS, Springfield, Va. 22151 as AD-753 623, Price $3.00 printed copy; $0.95 microfiche. M Sc Thesis, September 1972. 67 p, 17 fig, 1 tab, 25 ref, 2 append.

Descriptors: *Sediment transport, *Beach erosion, *Littoral drift, *Bays, *California, Sediments, Sands, Particle size, Analytical techniques, Estuaries, Sedimentology, Coasts, Ocean waves, Tidal effects, River flow, Inflow.
Identifiers: *Carmel River State Beach (Calif).

The direction of sand movement along the Carmel River State Beach in California was qualitatively determined by diving observations, a bathymetric survey, wave refraction diagrams and a sediment size analysis of 18 samples. The primary source of sediments for the beach appears to be the Carmel River which flows only seasonally. Sedimentary material is introduced into the bay after winter precipitation provides a sufficient amount of runoff to warrent the opening of the river mouth by bulldozer. The fine sedimentary material is lost offshore and the coarser material is either redeposited on the beach or is carried south with the littoral drift and deposited at a nodal point in the sand transport pattern. This node is located on the northern edge of the head of the Carmel Submarine Canyon. Winter storms probably induce slumping or gravity sliding and much of the material is carried to deeper water by the canyon. (Woodard-USGS)

SAND TRANSPORT BY THE EEL RIVER AND ITS EFFECT ON NEARBY BEACHES,
Geological Survey, Menlo Park, Calif.
J. R. Ritter.
Geological Survey Water Resources open-file report, 1972. 17 p, 6 fig, 4 tab, 20 ref.

Descriptors: *Sediment transport, *Sands, *Sediment deposition, *Beaches, *California, Data collections, Estuaries, Rivers, Streamflow, Sediment yield, Discharge (Water), Sediments, Particle size.
Identifiers: *Eel River (Calif), Heavy minerals.

The Eel River basin in California has one of the largest sediment yields per unit area in the world. Sand composes about 25% of the total sediment transported by the river into its estuary. The annual sand load averages about 4,600,000 tons, equivalent to a deposition of about 2,100 acre-feet of sand per year. Most of this sand enters the ocean; some is deposited in the estuary. The amount furnished to nearby beaches is small. The major part of the sand and finer sediment debouched by the Eel River into the ocean is scattered over the continental margin, some is trapped by the Eel Canyon, and some is deposited offshore near the Eel River mouth. The Eel probably supplies most of the sand found along the beaches between Centerville Beach and the entrance to Humboldt Bay. The Mad and Little Rivers supply most of the sand found along the beaches between the entrance to Humboldt Bay and Moonstone Beach. Sand is defined as sediment having an intermediate diameter of 0.062-2.0 mm. Results provide an insight to the possible consequences to the coast if the sand being discharged by the Eel River is interrupted by works of man, such as a dam on its lower reaches or dredging operations at its mouth. THE SEASONAL CYCLE OF VITAMIN B12 IN THE STRAIT OF GEORGIA, BRITISH COLUMBIA,
British Columbia Univ., Vancouver. Inst. of Oceanography.
S. A. Cattell.
Journal of the Fisheries Research Board of Canada, Vol 30, No 2, p 215-222, February 1973. 2 fig, 3 tab, 29 ref.

Descriptors: *Bioassay, *Seasonal, *Cycling nutrients, *Phosphates, *Nitrates, *Distribution patterns, Nutrients, Vitamin B, Sampling, Water analysis, Nitrites, Depth, Salinity, Cultures, Growth rates, Water temperature, Marine algae, Pyrrophyta, Dinoflagellates, Phytoplankton, Estuarine environment.
Identifiers: *Vitamin B-12, *Amphidinium carteri, Strait of Georgia, Juan de Fuca Strait, Sample preparation, Particulate matter, Coulter counter.

Water samples were collected from four stations in the Strait of Georgia, British Columbia and one station in the waters connecting the Strait of Georgia and Juan de Fuca Strait over a period of 17 months for use in investigating the seasonal cycle of vitamin B12. Samples were filtered and frozen in polyethylene containers for analysis of phosphate, nitrate-nitrite nitrogen and vitamin B12. Salinity and temperature were also determined for each sample. Vitamin B12 was determined by bioassay using Amphidinium carterae. After culturing for 11 or 12 days, bioassay samples were diluted and counted on a Model B Coulter Counter. The final yield of cell numbers was found with control solutions to be linearly related to vitamin B12 concentrations of at least 10 mg/liter. The results show that monthly averages for B12 in the upper 10 m of the Strait of Georgia are similar in temporal distribution to those of the inorganic nutrients including a winter high followed by an early spring decrease and a slight peak in late spring. However, B12 showed a peak in the summer while inorganic nutrients were at minimal concentrations. Furthermore, inorganic nutrients tended to increase with depth and correlated with water density. B12, however, showed little correlation with this parameter, even with summer stratification. It is concluded that the temporal and spatial distribution of B12 in the Strait is more complex than that of nitrate and phosphate. It is hypothesized that the observed heterogeneity of B12 is largely a result of interactions of vitamin particulate matter. (Little-Battelle)

NUTRIENT INVERSIONS IN THE SOUTHEASTERN TROPICAL PACIFIC OCEAN,
Scripps Institution of Oceanography, La Jolla, Calif.
W. H. Thomas.
Fishery Bulletin, Vol 70, No 3, p 929-932, 1972. 3 fig, 11 ref.

Descriptors: *Pacific Ocean, *Nitrates, *Phosphates, *Nitrites, *Silicates, Salinity, Depth, Phytoplankton, Chlorophyll, Water analysis, Sea water, Nutrients, Distribution patterns, Withdrawal.
Identifiers: *Nutrient inversion.

During a cruise of the Pacific Ocean in 1970, samples of seawater were collected at various depths in Nansen bottles for analysis of nitrates, nitrites, phosphates, and silicates. Plots of nutrient concentration versus depth showed that at a typical station nutrients such as nitrate and phosphate were high at the surface, at a minimum at about 100 m depth, and then increased at greater depths. Silicate followed this distribution to a lesser degree. These inversions occurred from lat 8 to 15 degrees S and were more pronounced in sections along long 126 degrees W and 119 degrees W than in sections farther east. The nutrient minimum was associated with water having a salinity maximum. It is suggested that such water may have acquired its characteristics in the mixed layer in areas to the south or southeast where the nutrients were depleted by phytoplankton, and had then sunk below high-nutrient and relatively fresh water carried westward from the Peru Current. However, the nutrients may also have been depleted in situ since the low-nutrient water contained a maximum amount of chlorophyll. (Little-Battelle)

THE MECHANISM OF FORMATION OF 'SKINNED' TYPE MEMBRANES AND THEIR CHARACTERIZATION,
Hydronautics, Inc., Laurel, Md.
M. A. Frommer, and R. Matz.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $1.25. Office of Saline Water Research and Development Progress Report No 774, May 1972. 125 p, 14 tab, 39 fig, 88 ref. 14-30-2529.

Descriptors: *Reverse osmosis, *Desalination, *Membranes, *Membrane processes.
Identifiers: *Cellulose acetate, Skinned membranes, Asymmetric membranes, Water flux, Salt rejection, Membrane formation, Membrane morphology, Membrane characterization.

This final technical report consists of a set of publications and preprints summarizing the most recent experimental observations not yet reported in the open scientific literature. Reflecting different aspects of the problems, these publications exhibit some diversity, and different degrees of refinement of approach. It is believed that these publications will make it possible to achieve a more meaningful and useful understanding of the complex phenomena involved in the preparation and characterization of skinned asymmetric membranes. The report describes an apparatus for studying the mechanism of skinned membrane formation, membrane structures and their relation to preparation conditions, and a theory of the mechanisms by which skinned membranes form. For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402 Price $0.75. Office of Saline Water Research and Development Progress Report No 775, May 1972. 80 p, 22 fig, 17 tab, 22 ref. 14-01-0001-2333.

Descriptors: *Desalination, *Membrane processes, *Dialysis, *Permselective membranes.
Identifiers: *Piezodialysis, *Charge-mosaic membranes, Ion-exchange resins.

Piezodialysis is a new and promising process for water desalination. In this process a concentrated salt solution passes through a membrane leaving a stream of reduced salinity. Based on irreversible thermodynamics, a mathematical description of the process has been obtained which, using the transport properties of the resins of which the membrane is composed, predicts the kind of performance which might be obtained. Strong coupling between the counterions and the gel water in the resins is required. Several ion-exchange resins have been developed which have adequate coupling between counterions and water. A variety of techniques have been investigated for using these resins in composite membranes, some of which have shown significant salt enrichments. A laboratory piezodialysis module which has given useful desalinations is described. (OSW)

THE GROWTH RATE OF ICE CRYSTALS: THE PROPERTIES OF CARBON DIOXIDE HYDRATE A REVIEW OF PROPERTIES OF 51 GAS HYDRATES,
Syracuse Univ., N.Y. Dept. of Chemical Engineering and Materials Science.
J. G. Vlahakis, H. S. Chen, M. S. Suwandi, and A. J. Barduhn.
Available from the National Technical Information Service as PB-217 615, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 830, November 1972. 180 p, 48 fig, 44 tab, 187 ref. 14-30-2763.

Descriptors: *Desalination, *Crystallization, *Freezing, Ice, *Hydrate processes, Carbon dioxide.
Identifiers: *Hydrating agents, *Ice crystal growth.

This report consists of four parts. Part 1 gives a brief review of the status of choosing a hydrating agent for use in the hydrate process for desalting. Nine agents are listed and at least four appear to be good possibilities: R-12 (CCl2F2), R-142b (CH3CClF2), R-152a (CH3CHF2), and R-31 (CH2ClF). Of these R-31 looks best. Part 2 covers work on CO2 hydrate for which the basic information are now available to make pilot plant designs and economic analyses. Part 3 is a review of the known properties of 51 gas hydrates including an extensive table of data and 80 references. Part 4 is concerned with ice crystal growth. The linear growth rate in the basal plane of unconfined ice crystals has been maesured in flowing subcooled water and aqueous NaCl solutions. (OSW)

Available from the National Technical Information Service as PB-218 055, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 818, August 1972. 55 p, 6 tab, 24 fig, 7 ref. 14-30-2810.

Descriptors: *Reverse osmosis, *Membranes, *Desalination, Permeability, *Fouling, Compaction, *Morphology, Water transport.
Identifiers: Hollow fibers, Polybenzimidazole, Membrane fouling, Membrane compaction, Permeability instrument.

Laboratory evaluations have shown that PBI hollow fiber membranes possess outstanding desalination properties. Water flux as high as 10 gfd and salt rejections as high as 99% have been achieved. Structure-desalination performance correlations were established in morphological examinations employing thermomechanical analysis (TMA), optical microscopy and scanning electron microscopy. Radial void structure, void concentration and shrinkage behavior were found to be related at least in a semiquantitative way to desalination performance based on a Loeb-type membrane structure. Membrane fouling was established as the major cause of the observed decline in flux and rejection, with compaction playing a minor role. Fouling was virtually eliminated by installation of a highly efficient filtration system. Flow testing showed that PBI membranes produce an acidic shift of more than one pH unit in the product water relative to the feed (0.5% NaCl) stream, and to this is ascribed a unique water transport mechanism. The transport of water through PBI and cellulose acetate (CA) films was investigated with the aid of a new permeability instrument to obtain fundamental characterization data on materials possessing good reverse osmosis properties. SPRAY FREEZING, DECANTING, MELTING AND HYDROLYSIS AS RELATED TO SECONDARY REFRIGERANT DESALTING,
Avco Corp., Wilmington, Mass. Avco Space Systems Div.
W. Gibson, G. Grossman, A. Modica, G. Siegelman, and G. Stepakoff.
Available from the National Technical Information Service as PB-218 056, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 816, July 1972. 17 p, 1 fig, 2 tab, 1 ref. 14-30-2770.

Descriptors: *Desalination, *Freezing, *Ice, *Hydrolysis.
Identifiers: Freon 114, *Spray freezer, Indirect melter, Hydrocyclone, Stripping, Decanting.

A secondary refrigerant freezing process is being developed which utilizes a pressurized wash column, indirect melter, and a nonflammable refrigerant. The performance of a spray freezer has been evaluated and it was found that a 50% yield could be achieved over a short fall height yielding crystal sizes in the range of 50-150 m. The crystals are platelets without evidence of dendritic growth. Freon utilization efficiency is close to 100% and production rates based on spray volume attain 600-700 lbs/hr ft3. The slurry has been compacted in a plug and pressure drop measurements have indicated permeabilities between 10-6 and 5 x 10-7 cm2 at pressure drops up to psi/inch. Attendant upon secondary refrigerant freezing in any form is the removal of dispersed refrigerant from the ice-brine slurry which results from incomplete utilization in the freezer. A study of gravity decanting indicated that the characteristic times were too slow for a high rate compact desalting process, thus, the effort was switched to forced decanting as embodied in hydrocyclones. Two types of packing for vacuum strippers were evaluated for their feasibility in terms of cost and physical size. Hydrolysis of refrigerant represents an economic loss to a secondary refrigerant process. A study was conducted to define the magnitude of this problem particularly in terms of the refrigerant of choice F-114. A theoretical model was developed and checked experimentally. Remarkably good agreement was shown and hydrolysis losses were proved to be negligible. The process employs an indirect melting system to prevent contamination of the product water and loss of pump work associated with the pressurized wash column. Theoretical studies of melting phenomena leading to scaling laws were also conducted. (OSW)

RESEARCH ON REVERSE OSMOSIS MEMBRANES FOR PURIFICATION OF WASH WATER AT STERILIZATION TEMPERATURE (165F),
General Electric Co., Lynn. Mass.
J. M. Amore, J. F. Enos, and A. B. LaConti.
Available from the National Technical Information Service as PB-218 162, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 815, December 1972. 57 p, 13 tab, 7 fig. 14-30-2752.

Descriptors: *Reverse osmosis, *Membranes, *Ion transport, Permeability, Separation techniques, Water purification.
Identifiers: *Wash water, Sulfonated polyphenylene oxide, Wash water renovation, Detergent removal (Reverse osmosis), Sterilization (Membranes), Urea removal.

The object of this research was to conduct the necessary modification and development of sulfonated 2, 6-dimethyl polyphenylene oxide (PPO) membrane to obtain optimum reverse osmosis (RO) performance on synthetic and real wash water at sterilization temperatures (greater than or equal to 165 F) and maximum pressure of 800 psi. The goal was to obtain a RO permeate containing less than 10 microorganisms/cc and to achieve a stable flux of 5 gsfd with rejections of NaCl (85.0%), urea (99.3%), lactic acid (99.0%) and detergent or soap (99.9%) with a synthetic wash water feed containing 1500, 1000, 700, and 10,000 ppm, respectively, of the wash water species. Solvent cast sulfonated PPO membranes were

developed with IEC (Ion Exchange Capacity)±1.22 to 2.28. It was demonstrated with real shower water that RO operation with these membranes at 165F yields a permeate free of microorganisms. The low IEC membranes were shown to be extremely stable as evidenced by invariant fluxes and rejections during life tests of up to 3000 hours with 165F wash water containing 10,000 to 20,400 ppm Olive Leaf (soap), Modified Approve (soap/detergent) and dodecylbenzene sulfonate (detergent). During a 3000-hour life test, a 1.36 IEC membrane exhibited a steady state of 3 to 5 gsfd and average rejection of NaCl (97%), urea (45%), lactic acid (99%) and soap (99%). Decreasing the thickness of the 1.3 IEC membranes by approximately an order of magnitude (0.2 to 0.02 mil) increased the initial flux from 1.5 to 18.3 gsfd with essentially no decrease in rejection. RO tests were successfully run at several temperatures (165 to 206 F). pressures (400 to 800 psi), and feed flow rates (0.04 to 2 gal/min) to help define the operating parameters for a practical hardware configuration. (OSW)
W73-11159

ION TRANSPORT THROUGH LAYERED ION EXCHANGE MEMBRANES,
Massachusetts Inst. of Tech., Cambridge, Mass.
A. A. Sonin, and G. Grossman.
Available from the National Technical Information Service as PB-218 236, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 814, July 1972. 48 p, 10 fig, 23 ref. 14-30-2749.

Descriptors: *Desalination, *Ion exchange, *Membranes, *Electrodialysis, *Ion transport.
Identifiers: Anion exchange membranes, Cation exchange membranes, Bipolar membranes, Laminar ion exchange membranes, Current-voltage characteristics.

The steady-state transport characteristics of a family of ion exchange membranes composed of contiguous layers of anion and cation exchange materials are described in terms of a simple physical model. Membranes consisting of up to four layers are considered. Explicit analytic expressions are derived which relate the current-voltage characteristics and transport numbers to the membrane structure and to the concentrations of the bounding solutions. The current-voltage characteristics are shown to be anisotropic with respect to current direction, showing current saturation in one or both directions, depending on membrane structure. The results are compared with available data on bipolar membranes. An analysis is also given for the general performance characteristics, including the effects of concentration polarization in the bounding solutions, of a three-layered membrane consisting of a thick central ion exchange layer sandwiched between two extremely thin ion exchange layers of opposite sign. This combination may serve as a model for the effects of certain types of membrane fouling in practical applications such as electrodialysis. It is shown that even very thin surface layers can reduce the limiting current to a value significantly below the diffusion-controlled one which is expected in the absence of the surface films. (OSW)
W73-11160

INVESTIGATION OF PHASE AND STATE RELATIONS IN COMPLEX LIPID SYSTEMS,
Philco-Ford Corp., Newport Beach, Calif. Aeronutronic Div.
R. C. Bean.
Available from the National Technical Information Service as PB-218 237, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Program Report No 812, November 1971. 60 p, 15 fig, 7 tab. 14-30-2710.

Descriptors: *Membranes, *Desalination, *Ion transport, *Lipids, Permeability, *Reverse osmosis.
Identifiers: *Lipid membranes, Water permeability, Thermal transitions, Amphipathic lipids, Photoelectric reaction, Bilayer lipid membrane, Salt rejection, Lipid-Loaded membranes, Lipid-Skin membranes, Cast lipid membranes.

Permeability was studied with lipids incorporated into membranes or dispersed in a bulk phase. Membrane forms included: the lipid-loaded membrane, in which membranes were prepared by saturating a microporous, polymeric support with lipids and then treating in various ways; the lipid-skin membrane, formed by compressing a thin film of lipid particles onto one face of a microporous support; the cast-lipid membrane, formed by casting a solution containing both lipid and polymer upon a glass surface; and the bilayer lipid membrane (BLM). Results of studies on the lipid-loaded membranes demonstrated that they generally had a low resistance at temperatures below a transition temperature near the melting point of the lipid. At this point, an abrupt 100 to 10,000-fold increase in resistance occurred in all cases, except with primary alkylamines. At temperatures below the liquifying transitions, some membranes had excellent ion selective properties with low resistance (10 to 50 ohm cm2). Various membranes, supported in cellulose ester microporous filters, produced photovoltaic and/or photoconductive responses to ultraviolet illumination. Photopotentials ranging up to 150 mv were obtained. Sensitization to visible lighr could be developed with certain dyes (e.g., methylene blue, rhodamine B). Polyamide membranes case with certain anionic or neutral long alkyl chain lipids incorporated into the casting solutions showed better water permeability and salt rejection than similar membranes prepared without lipids. (OSW)
W73-11161

A STUDY OF VAPOR PHASE POLYMERIZATION AND CROSSLINKING TO PREPARE REVERSE OSMOSIS MEMBRANES,
Research Triangle Inst., Durham, N.C.
H. Yasuda.
Available from the National Technical Information Service as PB-218 238, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 811, June 1972. 104 p, 38 fig, 23 tab, 43 ref. 14-30-2658.

Descriptors: *Desalination, *Reverse osmosis, *Membranes, *Sea water, *Permeability.
Identifiers: *Plasma polymerization, Silent-glow discharge, Composite membranes, Porous substrates, Ultra-thin-films, Organic-nitrogen-compounds, Dry-state-membranes.

Composite membranes are being prepared for use in sea water desalination via reverse osmosis by the vapor phase polymerization and crosslinking of heteroaromatic nitrogen compounds, aromatic amines and other nitrogen containing compounds in a silent glow discharge tube. The plasma formed ultrathin membranes have exhibited salt rejections greater than 99.5 percent at high water flux levels. Membrane performance was found to be stable after 20 days with no visible decline in water flux using 3.5% NaCl at 1500 p.s.i. It is anticipated that the plasma polymerization technique which is under development can be applied to porous substrates in planar, tubular and hollow fiber form. (OSW)
W73-11162

MEMBRANE FOULING IN ELECTRODIALYSIS: A MODEL AND EXPERIMENTS,
Massachusetts Inst. of Tech., Cambridge, Mass.
G. Grossman, and A. A. Sonin.
Available from the National Technical Information Service as PB-218 325, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 813, July 1972. 36 p, 7 fig, 15 ref. 14-30-2749.

Descriptors: *Desalination, *Membranes, *Electrodialysis, *Mathematical models, *Hydrodynamics, Ion exchange, Films.
Identifiers: Limiting current, *Membrane fouling, Colloidal deposits, Ion exchange films, Neutral fouling film, Charged fouling films, Polarization.

Membrane fouling is a common cause for poor performance in electrodialysis systems, usually because it reduces the limiting current. Fouling may be caused by deposits of either neutral matter or colloidal matter with ion exchange properties. In the present paper a model for membrane fouling is developed and expressions are derived for the reduction in limiting current caused by both neutral fouling films and films having ion exchange properties. The effect of fouling is shown to depend not only on the properties of the fouling film, but also on the hydrodynamic conditions in the channels and in the case of ion exchange fouling films on the salt concentration in the dialysate channel. Ion exchange fouling films are shown to be much more effective in reducing the limiting current than neutral films. Some experimental data are presented which confirm the trend of the theory for fouling with ion exchange films. (OSW)
W73-11163

THE ROLE OF DESALTING IN PROVIDING HIGH QUALITY WATER FOR INDUSTRIAL USE,
SCS Engineers, Long Beach, Calif.
C. J. Schmidt, and D. Ross.
Available from the National Technical Information Service as PB-218 465, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 819, December 1972. 146p. 14-30-2776.

Descriptors: *Desalination, *Demineralization, Ion exchange, Membrane processes, Economic feasibility, Costs, *Industrial water.
Identifiers: *Industrial water users, Boiler feed water, Industrial plants, Nuclear plants, Electronics industry, Chemical process industries.

Literature searches, correspondence and field interviews were used to estimate demineralized water requirements of ten major industrial categories. Industrial boiler feed water treatment was the major volume use, followed by power generation, electronics manufacture and chemical process industries. Users of water containing less than 1 ppm TDS included nuclear-fueled power plants, and electronics manufacturers. Desalting equipment is applicable for partial demineralization followed by mixed-bed deionization. Industries requiring water with a quality of 2 to 10 ppm TDS included older fossil-fueled utility power plants, high pressure industrial boilers, chemical process, motor vehicle and aircraft, drug, and photographic supplies. Desalting equipment is applicable for partial demineralization followed by two-bed deionization. Industries requiring water with a quality of 10 to 200 ppm TDS included low pressure industrial boilers, food processors, and producers of primary metals, beverages, paper and bottled water. Partial demineralization by desalting may be the only treatment required. Curves were developed to illustrate cost vs. raw water quality for various product water qualities and treatment systems. Membrane desalting techniques become economically competitive with ion-exchange resins as the dissolved salts in the raw water increase. (OSW)
W73-11164

A NEUTRON SPECTROSCOPIC STUDY OF THE DIFFUSIVE KINETICS AND INTERACTIONS OF WATER IN DENSE LAYER DESALINATION MEMBRANES,
Union Carbide Corp., Tuxedo, N.Y.

G. J. Safford, and P. S. Leung.
Available from the National Technical Information Service as PB-218 547, $3.00 in paper copy, $0.95 in microfiche. Office of Saline Water Research and Development Progress Report No 834, July 1972. 53 p, 14 fig, 1 tab. 14-30-2891.

Descriptors: *Desalination, Physicochemical properties, *Reverse osmosis, *Membrane processes, Membranes, *Diffusion, *Kinetics.
Identifiers: *Neutron spectroscopy, Differential scanning calorimeter.

Neutron spectroscopic investigations were carried out to systematically study and determine, at a molecular level, the factors and properties that control the diffusion and bonding of water in 'dense skin' cellulose-acetate desalination membranes. Data were taken both to determine the functional form of the diffusive kinetics that characterizes the transport of H2O molecules in membranes and then study the influence on the bonding and kinetics of the individual water of: (a) extent of membrane hydration, (b) number of hydrophilic groups, (c) variations in molecular weight, (d) temperature, (e) the presence of all included salt (NaCl), and (f) heat treatment and compaction and their relationship to the casting process. To complement the neutron scattering results, differential scanning calorimetric measurements were made to determine the transitions characteristic of the 'dense layer' materials. The relationship between these transitions and the membrane morphology as well as variations that result from different casting techniques and heat treatment are discussed. (OSW)

Descriptors: *Dispersion, Convection, *Mixing, Mass transfer, *Desalination, Reviews.
Identifiers: *Miscible displacement.

The state of the literature when this work was begun can be summarized as follows: Dispersion models were assumed to apply to initial value problems like dispersion of a slug stimulus and transient boundary value problems like a uniform step change at the inlet to a tube, subject to the condition that they are valid only after a certain amount of time has elapsed since the start of the process. In such cases the dispersion coefficient was a constant depending upon flow geometry and conditions of flow if the flow was steady, and time dependent if the flow was time dependent. These models were, and still are, used to describe transport processes in a variety of situations such as chemical reactors, packed bed adsorption columns, double-pipe heat exchangers, etc. Using the series solution developed by Gill, the dispersion model can be derived from first principles, without making any arbitary assumptions, in a more general form which describes unsteady convective diffusion phenomena right from time zero in initial value problems. Furthermore the method of analysis developed here takes into account nonuniformities in the initial distribution which occur in practical cases. The technique will be extended to handle continuous source problems, such as material pollution into fluid streams, by using a superposition intergral. Unsteady convective diffusion due to a step change at the inlet is a special case of the continuous sorce problem. Results were developed which show the approach with increasing time, of this solution to the Taylor-Aris description of the problem. Then, an approximate solution for dispersion in vertical flows with significant buoyancy forces is developed. (OSW)

CENTRIFUGAL DISTILLATION SYSTEM,
F. Rosa.
U. S. Patent No. 3,725,209, 10 p, 11 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 909, No 1, p 301, April 3, 1973.

Descriptors: *Patents, *Distillation, Sea water, *Evaporation, *Centrifugation, *Heat exchange, Potable water, Water treatment, *Water purification.
Identifiers: Compression.

An improved apparatus and process is described for producing purified water more economically by low temperature, low pressure distillation using a combination of flash evaporation and vapor compression and condensation, and using centrifugal force to reduce the driving potential required to vaporize water from seawater and then to condense the vapor for withdrawal and use. The invention provides a void or vapor space within a rotating enclosure, introduces the distilland into an evaporating zone in the central portion of the enclosure to cause part of the distilland to flash into vapor, and condenses the vapor in a condensing zone around the evaporating zone by a combination of centrifugal compression developed by the rotating enclosure and circulating of distilland through the condensing zone in heat-exchanging relation with the vapor and condensed distillate therein. APPARATUS FOR USE IN AN IMPROVED ELECTRO-DIALYSIS PROCESS,
Consiglio Nazionale delle Ricerche, Rome (Italy).
R. Passino, and G. Boari.
U. S. Patent No. 3,728,248, 2 p, 6 ref; Official Gazette of the United States Patent Office, Vol 909, No 3, p 1052, April 17, 1973.

Descriptors: *Patents, Cation exchange, *Membranes, Resins, Salt water, *Electrodialysis, *Desalination, Sea water, *Demineralization.
Identifiers: *Ion-selective membranes.

The apparatus for demineralizing salt water consists of a hydrogen form cation exchanger and a sodium form cation exchanger. Salt water moves through the exchangers in parallel flow in a special proportion and the combined stream then passes through salt diluting chambers of an electrodialysis cell having ion-selective membranes. A decomposition voltage is passed across the electrodes. The concentrated salt stream is withdrawn and used to regenerate the sodium exchange resin. (Sinha-OEIS)

REVERSE OSMOSIS WATER PURIFYING SYSTEM WITH GRADIENT BARRIER WATER STORAGE CONTAINER,
Desalination Systems, Inc., Escondido, Calif. (assignee)
D. T. Bray.
U.S. Patent No. 3,726,793, 2 p, 1 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 909, No 2, p 683, April 10, 1973.

Descriptors: *Patents, *Reverse osmosis, Separation techniques, *Desalination, *Water treatment, *Water purification, Water quality.
Identifiers: *Temperature gradient, Density gradient, Water storage container.

A reverse osmosis water purification system is provided with an easily cleaned storage container werein a temperature gradient barrier is created at the interface between the purified product water and feed water to minimize intermingling of these waters. A product water storage container for the reverse osmosis water purification system supplies warmer product water to the upper end of the container and connects the lower end of the container to a line containing pressurized feed water. A pump produces pressure for the reverse osmosis process. The storage container is insulated to maintain the relative temperature of the two waters and to reduce the creation of convection currents. (Sinha-OEIS)

FLASH EVAPORATOR STRUCTURE,
Aqua-Chem, Inc., Milwaukee, Wis. (assignee)
R. W. Goeldner.
U.S. Patent No 3,729,383, 4 p, 19 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 909, No 4, p 1348, April 24, 1973.

Descriptors: *Patents, *Flash distillation, *Evaporators, *Desalination, Equipment, Salt water, Water treatment, Water quality.

A horizontally arranged multistage flash evaporator is described. A tubular vessel is divided into many flash chambers by transverse partitions. At their lower end the partitions provide a passage for feedwater from chamber to chamber. The flow of feedwater is regulated to effect a water seal between chambers. (Sinha-OEIS)

NUCLEAR DUAL PURPOSE PLANTS IN REGIONAL DEVELOPMENT,
Atomic Energy Commission, Oak Ridge, Tenn.
D. F. Cope, J. C. Jorgenson, and M. Lopez.
Paper, Int Symp Plann Water Resour, Mexico City, Mexico, Dec 1972. 38 p, 2 fig, 28 ref.

Descriptors: *Distillation, *Water costs, Desalination, Nuclear powerplants, *Desalination plants, *Mexico, *Southwest US, Electric power production, Environmental effects, California, Water resources, Fresh water, Nuclear energy, Technology, Municipal water, Industrial water, Irrigation water, Ecology, Bibliographies.
Identifiers: Nuclear power, Dual purpose nuclear plants, Electric power production.

Advantages of coupling water distillation and electricity generating plants into dual purpose facilities for simultaneous production of fresh water and electricity has been recognized for some time.

Nuclear energy is well suited as an energy source for these large dual purpose facilities, and water distillation plants are adaptable for coupling to nuclear reactors. Cost of produced water is generally higher than the price of natural water. However, this cost will decrease as experience is gained from building and operating more and larger dual purpose plants. New incremental supplies of natural water are insufficient to meet projected needs of many regions of the world. Desalting sea water using nuclear dual purpose plants seems to be the least expensive alternative for meeting future requirements. One region particularly suited for application of large nuclear powered dual purpose plants is Southwest US/Northwest Mexico. This region has rich productive land, but suffers from a shortage of fresh water, though the Pacific Ocean provides unlimited supplies of sea water for desalting. The role of dual purpose plants for this region and as related to other regions is discussed. (USBR)

THE IMPACT OF WEATHER MODIFICATION ON U.S. PLANNING FOR THE RIO COLORADO AND RIO GRANDE,
Bureau of Reclamation, Denver, Colo.
W. E. Howell.
Paper, Int Symp Plann Water Resour, Mexico City, Mexico, Dec 1972. 11 p.

Descriptors: *Weather modification, *Meteorology, *Cloud seeding, Snowpacks, Planning, Clouds, Rainfall, Constraints, Costs, Snowfall, Precipitation (Atmospheric), Water management (Applied), Streamflow, Desalination, Flow augmentation, Water reuse, Rio Grande River, Colorado River Basin.
Identifiers: Western U.S. Water Plan, Skywater Project, Water resources management, Cloud modification, Induced precipitation.

Under Project Skywater, the Bureau of Reclamation is conducting research and experimentation to develop weather modification technology for application to water resources management problems. These activities include an experimental program of cloud seeding for increasing winter snowpack in the Jemez Mountains of New Mexico, which drains into the Rio Grande, and a pilot project for snowpack in the San Juan Mountains of Colorado, from which meltwater reaches both the Rio Grande and the Colorado Rivers. Results indicate that under certain meteorological conditions associated with temperature distribution within the cloud systems, cloud seeding increases precipitation by 100% or more. Potential streamflow increases depend upon the frequency of occurrence of favorable conditions in given geographic and climatic settings. Estimates of water augmentation by snowfall stimulation in the Colorado and Rio Grande Basins are being incorporated into the Western US Water Plan. Estimated snowfall stimulation will contribute approximately 2 million acre-ft annually, or about a 14% increase, to the flow of the Colorado River at Lee's Ferry, Arizona, and about 100,000 acre-ft annually to the flow of the Rio Grande River at Bernalillo, New Mexico. HIGH-TEMPERATURE CONTACT NUCLEATION OF SUPERCOOLED WATER BY ORGANIC CHEMICALS AND APPENDIX OF COMPOUNDS TESTED,
Naval Weapons Center, China Lake, Calif. Michelson Labs.
A. N. Fletcher.
Available from NTIS, Springfield, Va 22151 as AD-753 465. Price $3.00 printed copy; $0.95 microfiche. Technical Publication 5439, November 1972. 16 p, 1 fig, 2 tab, 15 ref, append. (Reprinted from Journal of Applied Meteorology, Vol 11, No 6, p 988-993, September 1972.)

Descriptors: *Nucleation, *Freezing, *Organic compounds, Cloud seeding, Research and development, Testing procedures, Atmosphere, Temperature, Heat transfer, Supercooling, Weather modification, Artificial precipitation, Clouds, Evaluation.

In order to make an effective study and use of ice-nucleating agents for cloud seeding, it is essential that their characteristics be known under a range of conditions. A simple, rapid test is described that measures contact nucleation of supercooled water. Application of this contact-nucleation test at -3C to over 1,000 organic compounds resulted in only 47 that could be considered as 'active.' Materials such as metaldehyde, fluorenone, phenazine and phloroglucinol dihydrate were not found to be sufficiently 'active' to pass the contact-nucleation test in an unground state. It is proposed that the initial water-air interface may pass through a configuration that promotes the growth of ice embryos even though the final compound-water interface has a low 'activity,' i.e., a low prewet-nucleation temperature. Conversely, some compounds such as phloroglucinol dihydrate show little 'activity' for contact nucleation yet have a high prewet-nucleation temperature. A table of compounds passing contact-nucleation test at -3.0C includes their sources; average time to initiate freezing; percent of drops frozen unground and ground; and previously reported results. An appendix includes all organic compounds tested at -3C for contact nucleation of supercooled water. (Woodard-USGS)

3C. Use of Water of Impaired Quality

SHORT-TERM EFFECTS OF IRRIGATION WITH HIGH SODIUM WATERS,
New Mexico State Univ., University Park. Dept. of Agronomy.
J. U. Anderson, O. F. Bailey, and H. E. Dregne.
Soil Sci. Vol 113, No 5, p 358-362. 1972.
Identifiers: *Cotton-D, Irrigation, *Sodium waters.

The effects of 17 yr irrigations were studied to observe changes, to account for the initial success, and to relate changes in exchangeable sodium percentage (ESP) to predictive indices. Marked increases in ESP occurred in each of the 2 soil profiles in both surface and subsurface horizons. These increases were much greater in the soil which received an estimated 107 cm of irrigation annually than in the one which received an estimated 76 cm. Carbonate precipitation is believed to be occurring in the latter, and measured ESP is greater than the sodium absorption ratio (SAR). ESP is lower than SAR in the soil receiving the larger amount of irrigation water, indicting that equilibrium has not yet been achieved. The correlation coefficient (R) for ESP vs. estimated ESP was 0.91. The critical level of ESP for cotton growth appears to be about 25 in this situation.--Copyright 1972, Biological Abstracts, Inc.

NORTH ATLANTIC REGIONAL WATER RESOURCES STUDY : APPENDIX H, MINERALS.
Bureau of Mines, Washington, D.C.

North Atlantic Regional Water Resources Study Coordinating Committee Report, May 1972. 98 p, 14 fig, 4 tab.

Descriptors: *Water quality, *Mineralogy, *Mineral industry, *New England, *Water pollution sources, Water pollution control, Pollution abatement, Metals, Mining, Industrial production, Reviews, Projections, River basins.
Identifiers: *Mineral resources, North Atlantic Region, Middle Atlantic areas, Non-metals.

This report was compiled at the request of the Army Corps of Engineers and is a general appraisal of the mineral resources of the North Atlantic Region (NAR). Data were compiled on the water-related mineral commodities and their resources. Emphasis was placed on those minerals whose production or processing involves the use of significant quantities of water, or may cause water pollution, or may result in solid waste disposal problems. The study covers the mineral industry in all New England States, New Jersey, Delaware, and those portions of New York, Pennsylvania, Maryland, Virginia, and West Virginia that are in the New England and Middle Atlantic areas established by the Water Resources Council and designated as the North Atlantic Region. The analysis of data on water use by the mining industry and its waste water disposal problem is included. Data were compiled on the quantity and value of minerals produced in the Region in 1964. A table shows values of mineral production for all counties in NAR in 1969 and 1970. Water use data for 1962, obtained by canvassing mineral producers, were used to estimate future water requirements based on projections of mineral production. (Woodard-USGS)

EMERGING WATER SUPPLY TECHNOLOGY.
New York State Temporary Commission on the Water Supply Needs of Southeastern New York,

Albany.

March 1, 1973. 106 p, 11 fig, 9 tab, 24 ref, 2 append.

Descriptors: *Water supply, *Desalination, *Weather modification, *Water reuse, *Groundwater recharge, Water demand, Environmental effects, *New York.
Identifiers: Southeastern New York, *New York City.

Three technological means for increasing the water supply in southeastern New York, including New York City, are evaluated by a state commission appointed by Governor Rockefeller. The commission was to determine longrange water supply needs, evaluate alternatives to meet the needs, and make recommendations based on costs, administration feasibility, and environmental impacts. The emphasis of this report is on the technological alternatives of desalinization, weather modification, and waste water reuse. Desalinization was not recommended for southeastern New York because of excessive costs and problems of plant location and brine disposal. Weather modification was not recommended because of the uncertainty involved, the likelihood of only small increases in water supply, and the need to construct more reservoirs to hold water. Direct reuse and recycling of waste water was not recommended because of dangers to public health, however, indirect reuse was recommended, particularly groundwater recharge. For example, there is great potential for deep well recharge on Long Island. (Elfers - North Carolina)

Descriptors: *Public utilities, *Cost analysis, Sewerage, Water supply, Construction costs, Design criteria, Planning, *Wisconsin.
Identifiers: *Milwaukee Metropolitan Region.

The relationships between urban population density and costs of public utilities, i.e. sanitary sewer and water mains, are explored in this study. Data are taken from four suburbs around Milwaukee and synthesized to produce various cost curves. There is a need for cost data on public utility extensions and maintenance in order to develop planning and design standards. It was expected that an optimal population density for minimizing costs would be found, but such a level is not clear from the analysis. Some of the conclusions are that (1) the cost of construction of sanitary sewer mains increases at a decreasing rate up to about 12 persons per acre and decreases from 12 to 16 persons per acre; (2) the cost of sanitary sewer maintenance increases at a decreasing rate; and (3) the construction cost of water distribution systems increases up to 12 persons per acre and then decreases from 12 to 16 persons per acre. The article includes 15 graphs representing these data. (Elfers-North Carolina)

Identifiers: *Utility extension planning, Rockford (Ill), Winnebago County (Ill).

The inventory and analysis of existing water supply and sanitary sewer systems plus recommendations for future expansion are presented. The analysis consists of some basic discussions of water supply systems, water demands, sanitary sewer and treatment systems, and septic tank problems. The extension plans are presented in detail via maps and project listings and are based on metropolitan goals and policies and related to land use planning. The study is particularly concerned with the implementation of the proposed extensions and recommends careful financial planning including the use of service charges, the creation of a water supply authority well in advance of the future need to develop surface water supplies, and the extension of the present sanitary district to cover most of the county. Storm water drainage is recommended to be studied in a separate report. (Elfers-North Carolina)

Identifiers: *San Joaquin Valley (Cal.), Repayment analysis.

A multiperiod linear programming model of regional irrigation development is formulated to provide an operational approach to improved evaluation of economic efficiency (benefit-cost analysis) and financial feasibility (repayment analysis) of irrigation projects. The model is particularly useful where the time path of development is critical, for example, in large projects where market restrictions for the products produced may permit only a gradual approach to full development over a long period of time; the MPLP model incorporates sufficient flexibility to handle a wide range of differing empirical situations. The relationship of the model to economic theory and current agency practice is briefly outlined. An empirical application of the model to a large-scale component of the California water plan is reported; results show some deficiencies in previous planning procedures that may lead to difficulties in project repayment and create unforeseen negative welfare effects on nonproject producers. (Bell-Cornell)

STOCHASTIC RESERVOIR MANAGEMENT AND SYSTEM DESIGN FOR IRRIGATION,
New South Wales Univ., Kensington (Australia). School of Economics.
N. J. Dudley, and O. R. Burt.
Water Resources Research, Vol 9, No 3, p 507-522, June, 1973. 3 fig, 22 ref.

Descriptors: *Stochastic processes, *Reservoirs, *Management, *Design, *Irrigation, *Dynamic programming, Crops, Optimization, Simulation analysis, Irrigation efficiency, Estimating, Water resources development, Acreage, Value, Benefits, Decision making, Systems analysis, Mathematical models, Variability.
Identifiers: Design variables, Interseasonal, Intraseasonal, Intertemporal, Water application rates, Reservoir capacity, Distribution systems.

An integrated intraseasonal and interseasonal stochastic dynamic programming model is developed to determine an optimal decision rule with respect to the following classes of crop irrigation decisions: (1) intertemporal water application rates; (2) whether or not some acreage should be relinquished from further irrigations for the remainder of the season; and (3) the optimal acreage to plant for potential irrigation at the beginning of the season. Solutions of the problem are shown to be a basis for optimizing the levels of three design variables: Developed irrigation acreage, reservoir capacity, and distribution system capacity. A method is presented for incorporating variance, as well as expected value, of the net benefits into the decision criterion for optimal developed acreage. An application is made to a simplified real situation in which optimal acreage to develop is the only design variable. State variable transition probabilities are calculated by a simulation model. A significant trade-off is found between expected net benefits and their variability in determination of the optimal developed acreage for irrigation. (Bell-Cornell)

RADIAL PROPAGATION OF WATER POTENTIAL IN STEMS,
Auburn Univ., Ala. Dept. of Civil Engineering.
F. J. Molz, and B. Klepper.
Agron J. Vol 64, No 4, p 469-473, 1972. Illus.
Identifiers: Bark, *Cotton-D, Diffusion, Equations, Gossypium-Hirsutum-D, Mathematical studies, Phloem, *Radial propagation (Plants), Stems, Xylem.

Contraction and expansion of a cotton (Gossypium hirsutum L.) stem in response to a diurnal cycle of leaf water potential is described mathematically using a passive diffusion analysis. The domain of the problem is the stem phloem and associated tissues that are bounded on the outside by impervious bark and on the inside by the xylem that is assigned measured values of leaf water potential. Semiquantitative predictions are derived from numerical solutions of the linear radial diffusion equation, which yield phloem water potential as a function of space and time. Computations relating stem diameter, leaf water potential, and water flow between xylem and phloem fit experimental data. An apparent hysteresis in the stem diameter-leaf water potential relationship is partly explained in terms of the physics of the diffusion process in the stem. This study offers possibilities for relating internal plant water status to measurable external quantities such as stem diameter and for developing a nondestructive technique for the determination of plant xylem water potential.--Copyright 1972, Biological Abstracts, Inc.

INFLUENCE OF SOIL TEMPERATURE AND MOISTURE ON SURVIVAL AND GROWTH OF STRANDS OF PHYMATOTRICHUM OMNIVORUM,
Ruhr-Universitaet Bochum (West Germany). Lehrstuhl fuer Pflanzenphysiologie.
J. E. Wheeler, and R. B. Hine.
Phytopathology. Vol 62, No 8, p 828-832, 1972. Illus.
Identifiers: *Cotton, Fungus, Germination, Growth, *Phymatotrichum-omnivorum, Soils, Survival, Soil temperature, Soil moisture.

Strands of P. omnivorum on roots of cotton plants killed by the fungus during the summers of 1968 and 1969 were not viable after midsummer of 1969 and 1970, respectively. Strands buried 25 cm deep in the rhizosphere of cotton plants growing in the field did not survive longer than 3 mo. Strands introduced into nonsterile Gila silt loam (GSL) at 10 deg C at initial moisture levels of 12, 22 and 30% (equivalent to 15, 1/3 and 1/10 atmospheres tension, respectively) were viable after 9 mo. when moisture levels had decreased to as low as 8% (oven-dry basis). No strands survived 6 mo. at 27 and 32 deg C at the 3 moisture levels. Optimum strand formation occurred at 27 and 32 deg C in nonsterile GSL at 22 and 30% moisutre levels. Strand formation was sparse at 16 and 35 deg C. No structures occurred at 10 or 40 deg C. Strands placed in nonsterile GSL at 22% moisture, germinated at 10 deg -32 deg C, but not at 35 deg C.--Copyright 1973, Biological Abstracts, Inc.

FERTILIZER RESPONSE TO THE PHYSICAL EFFECTS OF SOIL COMPACTION,
Uttar Pradesh Inst. of Agricultural Sciences, Kanpur (India).
Y. P. Singh, and R. N. Gupta.
J Indian Soc Soil Sci. Vol 19, No 4, p 345-352. 1972. Illus.
Identifiers: *Fertilizers, Growth, Nutrients, *Soil compaction, *Wheat-M, Yield, Soil physical properties.

The effect of fertilizer response to various levels of soil compaction on the growth, nutrient uptake and yield of wheat in an artificially compacted fine sandy loam soil was studied. Eight levels of compaction (1.11, 1.18, 1.26, 1.35, 1.44, 1.53, 1.61 and 1.70 gm/cc) and 2 levels of fertility (control and 150 ppm N + 75 ppm P2O5 + 75 ppm K2O) were tried in 3 replications. Compacting the soil from 1.11-1.70 gm/cc resulted in large decrease in its total and aeration porosity and hydraulic conductivity. The relationship between bulk density of soil and crop growth or nutrient uptake was parabolic in nature. An optimum compaction of 1.35 gm/cc was most favorable for crop growth. Fertilization failed to alleviate the adverse effect of soil compaction. Fertilizer response was maximum at the optimum bulk density of 1.35 gm/cc and was considerably reduced at higher and lower compaction levels. Interaction between compaction and fertility was significant for number of ear bearing tillers, uptake of N and P.--Copyright 1972, Biological Abstracts, Inc.

THE EFFECTS OF WATER STRESS ON NITROGEN-FIXING ROOT NODULES: II. EFFECTS OF THE FINE STRUCTURE OF DETACHED SOYBEAN NODULES,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
J. I. Sprent.
New Phytol. Vol 71, No 3, p 443-450, 1972. Illus.
Identifiers: Air, Cells, Cortex, Cytoplasm, Infected, Mitochondria, *Nitrogen-fixing nodules, Nodules, Pericycle, Plasmodesmata, Ribosomes, *Root nodules, *Soybean-D nodules, Tissue, Vacuole, Vascular traces.

The fine structure of the noninfected (outer) region of a soybean root nodule is described. Apart from vascular traces, the cells are mainly vacuolate, with active cytoplasm. They are connected with each other and to cells of the infected region by numerous plasmodesmata. A network of air spaces runs throughout the nodule. Atmospherically applied water stress affects the outer cells of the nodule more quickly and more severely than the inner cells. In any region, vacuolate cells are more susceptible to stress than nonvacuolate cells. Loss of about 30% of their fresh weight results in breakdown of the cytoplasm into approximately spherical subunits, some of which are coated with ribosomes. Organelles such as nuclei and mitochondria retain their structure longer than the rest of the cytoplasm. More severe stress is needed to affect infected and pericycle cells, which are nonvacuolate. It is concluded from the fine structure of stressed and unstressed nodules that the vacuolate cells of the cortex play an integral part in the N-fixing activities of the whole nodule. THE EFFECTS OF WATER STRESS ON NITROGEN-FIXING ROOT NODULES: III. EFFECTS OF OSMOTICALLY APPLIED STRESS,
Dundee Univ. (Scotland). Dept. of Biological Sciences.
J. I. Sprent.
New Phytol, Vol 71, No 3, p 451-460, 1972. Illus.
Identifiers: Acetylene, Applied, Cells, Cortical, Mannitol, *Nitrogen-fixing nodules, *Osmotic stress (Plants), Respiration, Root nodules, Roots, Salt, Solutions, *Soybean-D roots.

The effects of osmotic stress on N fixation and respiration of soybean root nodules were investigated. Nonelectrolytes, such as mannitol, depressed acetylene reduction when given to detached nodules in sufficient concentration to withdraw water from them. When given to the root systems of whole plants, hypotonic concentrations of mannitol had a depressing effect after 1-2 hr, the exact time depending on the size of the nodules. Equivalent concentrations of salts had a

much more rapid effect on whole root systems and on detached nodules (less than 5 min); 100 meq/l almost stopped acetylene reduction by small nodules. These effects could not be transmitted via the roots and needed contact between salt solution and nodules. They were accompanied by a decrease in respiratory activity and were fully reversible if the root systems were flushed with water within a few hours of treatment. High salt concentrations, as in sea water, had a rapid (1--2 min) effect, which after 20 min became irreversible. The effects of salt stress are interpreted as resulting from alterations in the metabolism of the cortical cells of the nodules. (See also W73-11415)--Copyright 1972, Biological Abstracts, Inc.

WATER REQUIREMENTS FOR OPTIMUM CROP YIELD,
Corps of Engineers, West Palm Beach, Fla.
S. F. Shih, R. E. Sneed, and R. S. Sowell.
Paper 72-773, 1972 Annual Meeting American Society of Agricultural Engineers, Chicago, Ill, Dec 1972. 16 p, 6 tab, 5 ref.

Descriptors: *Agronomy, *Water requirements, *Crops, Mathematical models, Water utilization, Root systems, Time, Irrigation efficiency, Computer programs, Consumptive use, Crop response, Soil-water-plant relationships, Fourier analysis, Growth stages, Growth rates, Root development, Soils, Plant growth, Crop production.
Identifiers: Coefficients.

Two mathematical models developed to provide input for determining agricultural water requirements are presented. One determines the water requirement of a plant as a function of time after planting; the other determines the rooting depth as a function of time from date of planting and soil type. Both models are formulated to make daily calculations from planting date through maturity. Computer programs were developed to determine coefficients of the equations presented. With these coefficients, the model was then used to predict water use and rooting depth of plants as a function of time during the growing season. Predicted water use agreed closely with observed data for selected crops grown in North Carolina. Applications of the water use model and the root depth model are tabulated. With the tabulated data and rainfall data, the water-holding capacity of the soil will be used to determine irrigation water requirements for each soil/crop combination in any of the 60 time intervals during the year. REHABILITATION OF IRRIGATION SYSTEMS FOR SALINITY CONTROL,
Colorado State Univ., Fort Collins.
G. V. Skogerboe, and W. R. Walker.
Paper 72-761, 1972 Annual Meeting American Society of Agricultural Engineers, Chicago, Ill, Dec 1972. 13 p, 11 ref, append.

Descriptors: *Return flow, *Salinity, *Water quality control, *Hydraulic structures, Irrigation water, Rates of application, Canal seepage, Water quality, Subsurface drainage, Water management (Applied), Irrigation operation and maintenance, Irrigation practices, Consumptive use, Irrigation design, Agricultural engineering, Automatic control.

Prevention or control of salinity added to water resources from irrigation return flow is both difficult and expensive. Potential solutions and control measures involve rehabilitation of the irrigation system by structural improvements and improving water distribution to better control cropland applications. Purposes and design criteria for some fundamental hydraulic structures discussed are: canal turnouts, control structures, flow measuring structures, canal linings, and farm structures. Automation and prefabrication are seen as time, labor, and money-saving aspects of successful system rehabilitation. Distribution system management methods must be revised so that only the required water is delivered to individual turnouts. Mandatory use of call periods will aid on farm irrigation efficiencies by encouraging farmers to plan their irrigation. Irrigation scheduling services combining meteorological data and soil moisture levels to forecast future irrigations in applied depths as well as timing are described. The importance of canal maintenance, managing system storage reservoirs, and managing waste water are discussed. Increasing water-use efficiency is not only a requirement for greater production, but is also necessary to reduce the impacts of water quality degradation. (USBR)

CROP RESPONSE TO TRICKLE AND SUBSURFACE IRRIGATION,
Texas A and M Univ., College Station.
E. A. Hiler, and T. A. Howell.
Paper 72-744, 1972 Annual Meeting American Society of Agricultural Engineers, Chicago, Ill, Dec 1972. 22 p, 6 fig, 3 tab, 18 ref.

Descriptors: *Crop response, *Irrigation efficiency, *Subsurface irrigation, *Trickle irrigation, Consumptive use, Evapotranspiration, Growth rates, Lysimeters, Irrigation practices, Irrigation systems, Irrigation water, Mist irrigation, Wind speed, Moisture content, Sorghum, Surface irrigation, Bibliographies, Crop production.

An investigation was conducted to compare water-use efficiencies using different irrigation methods, and to evaluate effects of reduced irrigation amounts on yields using trickle irrigation. Grain sorghum was grown during 1971-72 in a field lysimeter installation where complete control of the soil water could be maintained. Irrigation treatments included subsurface, trickle, subsurface plus mist, trickle plus mist, and surface. Water measurements were made to determine irrigation amount, storage depletion, and drainage amount, so that total crop water use could be determined. Trickle and mist treatment resulted in the highest water efficiencies. The increase in water-use efficiency based on total water use was 42% for trickle treatment compared to surface treatment. Grain sorghum growth as indicated by crop height and leaf area index was greater for all 1971 intensive treatments than for the surface treatment. Comparison of 3 levels of trickle irrigation amounts in 1972 indicates that water-use efficiency increased by 50% with sparing trickle applications. (USBR)

THE ORIGIN AND DOMESTICATION OF SORGHUM BICOLOR,
Illinois Univ., Urbana. Dept. of Agronomy.
J. M. J. DeWet, and J. R. Harlan.
Econ Bot. Vol 25, No 2, p 128-135. 1971. Illus.
Identifiers: Distribution patterns, Domestication, *Morphological variability, *Sorghum-Bicolor-M.

The distribution, morphological variability, affinities and ethnobotany of Sorghum varieties are discussed. The wild representatives of S. bicolor are strictly African in distribution. Descriptions are given of the different races. S. bicolor is an exceptionally complex sp. Cultivated sorghum is grown in regions with 10-120 in. annual rainfall. Sorghum was probably introduced into China some time after the beginning of the Christian era. Sorghum is absent from excavated early farming sites in the Near East. It may have been introduced into India from Africa by the end of the 2nd millenium B.C. Sorghum domestication may have been accomplished soon after agriculture was introduced into Bantu Africa.--Copyright 1972, Biological Abstracts, Inc.

FINANCING PRIVATE WATER RESOURCE DEVELOPMENT: ANALYSIS OF A STATE LOAN PROGRAM,
Wyoming Univ., Laramie. Div. of Agricultural Economics.
T. L. Dobbs, C. E. Olson, W. G. Wedemeyer, and G. H. Pfeiffer.
Water Resources Bulletin, Vol 9, No 1, p 129-139, February, 1973. 4 fig, 2 tab, 10 ref.

Descriptors: Water resources development, *Financing, *Investment, Economic feasibility, *Sprinkler irrigation, *Wyoming, *Irrigation programs, Agriculture, Farms, Regional development.
Identifiers: Economic analysis, *State loan programs, Firm growth, Forage crops, Groundwater development, Feasibility analysis.

Resulting from a marked decline in Federally financed water resources development, Western States are looking increasingly inward for support of irrigation projects. A State loan program is analyzed for its effects on groundwater development in Wyoming. The analysis focuses on the effects of low-interest State financing on the economic feasibility of investments in center-pivot sprinkler irrigation systems. The feasibility analysis indicates that investments in sprinkler systems for production of cash crops are highly profitable, and would frequently be carried out whether or not the State loan program were available. Investments in sprinklers for production of forage crops are perhaps frequently made attractive by the loan program. Thus, while the program appears to have accelerated the pace of private water resource development in Wyoming, it has also subsidized some investments that would have been carried out regardless of the program's existence. Further analysis indicates that sprinkler investments carried out with State financing contribute substantially to firm growth when cash crops are grown, but have less marked, and sometimes negative, effects on growth when forage crops are produced. Some positive effects of the loan program on southeast Wyoming's regional economy are noted, but a complete empirical analysis of regional impacts is beyond this study's scope. (Bell-Cornell)

Identifiers: USSR, *Karst topography, *Cuba.

A karstland is a unique physiographic complex and geographical landscape. The extent to which karst rocks and karst processes influence the landscape is determined by whether karst rocks outcrop directly at the surface of the ground, are covered with soil, or are overlain by nonkarstic material. Landscape features are most affected by denuded karst and least affected by buried or fossil karst. Karst studies made in Cuba in 1971 have shown that, in addition to mogotes (residual hills in the tropics), there are morphological and genetic forms of karst which must be considered as special tropical forms, despite their similarity to karst of temperate zones. ITERATIVE SIMULATION ALGORITHM IN RESERVOIR SYSTEMS OPERATION,
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
T. P. Chang, and G. H. Toebes.
Paper presented at International Association of Hydraulic Research. 1973. 8 p, 2 fig, 6 ref. OWRR-A-026-IND (1).

Descriptors: *Reservoir operation, *Reservoir storage, *Simulation analysis, *Multiple purpose reservoirs, *Flood control, *Water supply, Model studies.

For the operation of a multi-unit reservoir system with many control centers (check points, or feedback points, etc.) the building of a true systems policy leads to solving a very large set of many simultaneous, constrained equations. This problem is a key difficulty in building a systems operating policy. This paper relates how it can be solved in a trial and error fashion by an especially developed algorithm, which is called the 'iterative simulation algorithm'. It is applicable to systems policies for large numbers of reservoirs both in series as well as in parallel.

SOIL PHYSICAL FACTORS AFFECTING ROOT MORPHOLOGY AND STABILITY OF SCOTS PINE ON UPLAND HEATHS,
M. E. Faulkner, and D. C. Malcolm.
Forestry. Vol 45, No 1, p 23-36, 1972. Illus.
Identifiers: England, Morphology, Physical properties, *Pine-G, Pinus-Sylvestris-G, *Roots, Soils, Stability, Upland heaths.

Forty trees, on 5 heathland soil types, were pulled over and their resistance compared with described profile and physical features. Root morphology was found to be important for stability as was stem weight and soil strength. Ironpans reduce permeability to vertical drainage and delay but do not bar limited root penetration to the lower horizons. Root extension ceases at soil densities of about 1.5 g/cc. On freely rooted profiles root systems may continue to expand but on ironpan soils have occupied available space (at 30 yr) and further increases in tree size will result in increased instability.--Copyright 1972, Biological Abstracts, Inc.

Identifiers: *Oswego River System.

Presented is the mathematical basis of a reservoir-river systems operation, and its application to the systems conservation operations analysis. A relatively simple algorithm is developed to solve it. The 'level-number' technique is further extended to handle water reallocation schemes more flexibly. A completely general and flexible computer program which can be used to investigate a variety of management policies as well as various system configurations is developed as a result. A general and compact representation of the interaction of storage, release, and diversion operations is described. For any system configuration, the systems transition function has the same form; the difference between reservoir systems is reflected solely in the elements of the A matrix, the system configuration matrix, in the function. The systems conservation operation functions are derived from it and with relatively simple programming, the method can be applied to large scale systems conservation analysis. The storage reallocation method is formulated to handle linear and nonlinear operating rules. A multipurpose operation of the Oswego River System, a canal-river system with eight lakes, provides a case study for testing the computation procedures. (Bell-Cornell)

Descriptors: *Rivers, *River flow, *Streamflow forecasting, Hydrology, *Stochastic processes, *Regression analysis, *Inflow, Probability, Seasonal, Reservoir operation, Equations, Mathematical models, Systems analysis.

A predictive model, employing a first order autoregressive structure, which enables estimation of the probability distributions of streamflow volumes in future seasons, is developed. The model is applicable to streams that have intraseasonal runoff volumes describable by lognormal probability distributions. A season long observation provides the initial value which is propagated through future seasons by the first order autoregressive streamflow volume structure. For high interseasonal (lag one) correlations, application of the model yields valuable forecasts for as many as ten time periods in the future, while for low correlations such forecasting is of no additional value after four time periods. The method has greatest utility for streams having high variability and distinct seasonality. (Bell-Cornell)

Descriptors: *Water resources, *Water resources development, *Foreign research, Surface waters, Groundwater, Hydrologic data, Streamflow, Water balance, Water yield.
Identifiers: *Nepal.

The water resources potential of Nepal were surveyed on a countrywide basis. By 1969, a nationwide network of hydrological stations had been established for the collection of streamflow, sediment and meteorological data, and groundwater exploration was started in the Terai Belt. Average annual runoff in Nepal is more than adequate to meet existing needs for basic water supply, and a large potential exists for hydropower and irrigation development from the rivers. During the monsoon season, from the middle of June to late September, flooding commonly occurs in low-lying areas. In the late dry season, March to the middle of June, runoff is deficient in many areas of the country. Tube wells are the more suitable approach to supplying irrigation requirements in the Terai Belt, at least in the near future. Factors that affect the overall development of the water resources potential of the river basins in Nepal are discussed in detail. (Knapp-USGS)

THE EFFECTS OF DITCHING ON THE MOSQUITO POPULATIONS IN SOME SECTIONS OF JUNCUS SALT MARSH IN CARTERET COUNTY, NORTH CAROLINA,
North Carolina State Univ., Raleigh. Dept. of Entomology.
R. N. LaSalle, and K. L. Knight.
Available from the National Technical Information Service as PB-221 589, $3.00 in paper copy, $0.95 in microfiche. University of North Carolina Water Resources Research Institute Report No 82, June 1973. 162 p, 57 fig, 55 tab, 14 ref. OWRR B-027-NC (1), 14-31-0001-3316.

Descriptors: Mosquitoes, *Insect control, Vectors biological, Diptera, *Pest control, *North Carolina.
Identifiers: *Ditching, *Mosquito control.

Five areas of irregularly flooded salt marsh were studied to determine effects of ditching on mosquito populations. Principal species were Anopheles atropos Dyar and Knab, Anopheles bradleyi King, Aedes sollicitans (Walker) and Aedes taeniorhynchus (Weidemann). Present in lesser numbers were Culex salinarius Coquillett and Psorophora confinnis (Lynch Arribalzaga). Data on both plant cover and on the abundance of mosquito larvae showed such wide variation in both ditched and unditched sections that no significant differences between sections could be detected. Aedes and Psorophora larvae were more commonly collected from sites marginal to marsh, whereas Anopheles and Culex were more evenly distributed throughout study areas. Percentage of Aedes and Psorophora larvae taken in samples tended to be directly proportional to mean slope of the breeding depression and inversely proportional to its frequency of flooding. Conversely, the relative abundance of Anopheles and Culex species was directly proportional to the frequency of flooding. Relative abundance of species in the ditched sites was more affected by the mean slope, frequency of flooding and the ratio of frequency of flooding/mean slope than in the unditched sites. (Howells-North Carolina)

THE EFFECT OF ENVIRONMENTAL FACTORS ON WOOD CHARACTERISTICS: I. THE INFLUENCE OF IRRIGATION ON PINUS RADIATA FROM SOUTH AUSTRALIA,
J. W. P. Nicholls.
Silvae Genet. Vol 20, No 1/2, p 26-33, 1971. Illus.
Identifiers: *Australia (Mt. Crawford), Cells, Environmental studies, Fertilizers, Irrigation, *Pinus-Radiata-G, Tracheid, *Wood characteristics, Supplementary watering.

Specimens from 32 trees of P. radiata from 3 sites at Mt. Crawford were examined. Densitometric information and results for average tracheid length were collected from the last 10 successive growth rings in each tree. These data were analyzed to show the effect of supplementary watering and fertilizer treatment. The proportion of thickwalled cells associated with summer and autumn growth was increased from approximately 20% to 30%. Average tracheid length was not affected by supplementary watering. The changes in wood quality are not regarded as adverse and therefore the effect of the irrigation program is to increase the amount of acceptable wood.--Copyright 1972, Biological Abstracts, Inc.

PROGRESS REPORT OF RESIDUE STUDIES ON ORGANIC ARSENICALS USED FOR DITCHBANK WEED CONTROL,
Bureau of Reclamation, Denver, Colo.
H. A. Salman, T. R. Bartley, and A. D. Summers.
Bureau of Reclamation Report REC-ERC-72-37, Nov 1972. 8 p, 7 tab, 18 ref.

Descriptors: *Weed control, *Herbicides, Arsenic compounds, Chemical analysis, Irrigation canals, Irrigation water, Water quality, Water analysis, Johnsongrass, Irrigation, Irrigation operation and maintenance, Irrigation systems, Bibliographies, Rio Grande River, On-site investigations.
Identifiers: *Rio Grande Project, Arsenic.

Monosodium methanearsonate (MSMA) was applied to the ditchbanks of full and dewatered irrigation systems on the Rio Grande Project to control ditchbank weeds and to determine the MSMA residues in irrigation water. Information obtained will provide support for the registration of organic arsenicals used for weed control along full and/or dewatered ditchbanks. Water samples were analyzed for total arsenic content after sulfuric-nitric acid digestion by the silver diethyldithiocarbamate method. Maximum arsenic concentrations found in the first water released through dewatered laterals were 0.54, 0.12, and 0.29 ppm, dropping below the mandatory US Public Health Service Drinking Water Standards for arsenic within 10 min. Maximum arsenic concentrations in full canal systems following MSMA herbicide application to ditchbanks were 0.16, 0.17, and 0.86 ppm, but dropped rapidly after a period of time. Test results show that low levels of arsenic occur in irrigation water for short periods of time following ditchbank applications of MSMA. Theoretical calculations indicate that from 0.002 to 0.04 lb of arsenic per acre per treatment could reach the farmland during a 24-hr period using 6 in. of irrigation water. (USBR)

CITY OF ALBUQUERQUE SANDIA FOOTHILLS DRAINAGE.
O'Brien (Ken) and Associates, Albuquerque, N. Mex.

October 1971. 128 p, 24 fig, 6 tab, 68 ref, 3 append.

Descriptors: *Drainage systems, *Evaluation, Technology, Environmental effects, Water rights, Infiltration, Pit recharge, Water spreading, New Mexico, Rio Grande River, Controlled drainage, Drainage water.
Identifiers: *Sandia Foothills (New Mexico).

Since 1952, several drainage studies have been performed for the East Mesa of Albuquerque, New Mexico. This study focuses on the alluvial fans at the base of the Sandia Mountains on the East Mesa, and covers an area of 1 mile by 5 1/2 miles. Several alternatives were examined including interception of the runoff to the Tijeras Arroyo through open channels and undergroundpipes, and the interception of all runoff for infiltration. This would involve the use of detention basins, spreading grounds, recharge wells, recharge pits and other facilities. These two major alternative systems were examined by considering technical, economic and environmental considerations. The system to divert the water to the Tijeras Arroyo was favored because: (1) technically, it was felt to be more reliable than the capturing and infiltration of runoff; (2) economically, it would have a lower initial cost; and (3) environmentally, infiltration of runoff presented problems of possible ground water contamination. There is the possibility of perched water tables in conjunction with spread-

ing grounds and recharge pits, and recharge wells present the possibility of causing earthquake activity. Furthermore, New Mexico is a member of the Rio Grande Water Compact, and any water which is diverted from its normal flow to the Rio Grande would have to be replaced, and infiltration holds no real advantage in providing water supplies to the area. (See also W73-11669) (Poertner)

SUPPLEMENT TO CITY OF ALBUQUERQUE SANDIA FOOTHILLS DRAINAGE STUDY.
O'Brien (Ken) and Associates, Albuquerque, N. Mex.

March 1972. 31 p, 3 fig, 1 tab.

Descriptors: *Drainage systems, *Evaluations, *Flood control, *Infiltration, Controlled drainage, Economics, Environmental effects, Groundwater pollution, New Mexico, Ponding, Recharge, Recharge ponds, Pit recharge, Land forming, Water management (Applied).
Identifiers: *Albuquerque (New Mexico), Sandia Foothills.

The proposed drainage requirements of the Albuquerque Metropolitan Arroyo Flood Control Authority were examined to determine their general effectiveness and their effect on drainage system suggestions made previously for the Sandia Foothills in Albuquerque. In the previous study (See W73-11668) it was recommended that a system of open channels and underground pipes be used to convey the runoff to an outlet instead of retaining the water for infiltration. However, the proposed flood control authority policy and the basic strategy of reducing flooding by detaining and infiltrating runoff rather than disposing of it quickly. Limits were set on the maximum impervious area, and developments are to provide areas for the infiltration of all runoff from impervious areas, including rooftops, paved areas and streets. Design is to be based on the 100-year storm runoff, and infiltration areas could be used as open space recreational areas and be dedicated to the City. Many of the proposed requirements were based on worthwhile motives, but there were serious objections. The infiltration of urban runoff could cause serious pollution problems. Also, the requirements would make maintenance the responsibility of the private owner, and might be neglected. The proposed changes were more costly than the alternative drainage system--from $330,000 to $1 million more than the original cost of $3.68 million. (Poertner)

REDUCTION OF HYDRALIC SEWER LOADINGS BY DOWNSPOUT REMOVAL,
Springfield Sanitary District, Ill.
G. L. Peters, and A. P. Troemper.
Journal of the Water Pollution Control Federation, Vol 41, No 1, p 63-81, January, 1969. 12 fig, 7 tab.

Descriptors: *Flood control, *Sewerage, Storm water, Storm runoff, Controlled drainage, Storm drains, Urban drainage, Drainage systems, Sewers, Drainage programs, Drainage engineering, Drainage water, Water management (Applied), Roofs.
Identifiers: *Roof drain removal.

The removal of roof drains from the sewer system can markedly reduce sewer loading and flooding. Realizing this, the Springfield Sanitary District had an ordinance in effect since 1926 to prohibit such connections. However, there was no enforcement of this ordinance, and the problems of sewer overloading and flooding became worse. In 1948, a program was developed for the removal of these roof drains. But geographical limitations on the authority of the District prevented any real progress against the major problems of flooding in the city. A 1963 act of the Illinois Legislature expanded the authority of the Sanitary District and a new downspout removal program was begun in April of 1966, to last for 2 full years. The city was divided into districts and all buildings were checked by inspectors. During inspection, it was assumed that all drains discharging underground were illegal connections. After inspecting 25,527 buildings, 40 percent were found to be in violation. These people were sent letters advising them of their violation and suggested methods of compliance. Second inspections were made and initial compliance was over 50 percent. Further letters implying legal action and appeal to public spirit were sent. Eventually, all but 5 percent of all buildings complied with the law. Some of these were allowed to retain their connections because of hardship cases. The cost of removal in most cases was estimated at $5 to $100. The program was deemed very effective, not only in reducing flooding but, also, for reducing the amount of water put through the sewage treatment plant. (Poertner)

4B. Groundwater Management

GROUND WATER RECHARGE THROUGH PITS AND WELLS,
Kansas Water Resources Research Inst., Manhattan.
H. L. Manges.
Available from the National Technical Information Service as PB-221 329, $4.75 in paper copy, $0.95 in microfiche. Contribution Number 82, May 1973. 43 p, 10 fig, 5 tab, 29 ref. OWRR A-021-KAN (2). 14-01-0001-1084.

Descriptors: *Groundwater recharge, *Pit recharge, *Recharge wells, *Filtration, Drainage, Hydrology, Aquifers, Aquifer characteristics, Water treatment, Water purification, Water resources, *Kansas.
Identifiers: *Filter fabrics.

Well water was successfully recharged to the Meade formation in Southcentral Kansas through a pit and a well. However, when surface runoff water was recharged, the surface of the pit became sealed over for all practical purposes and the specific capacity of the well was reduced from 44 to 31 gallons per minute per foot of drawdown. Recharging of the aquifer appears feasible provided the water is of high quality. In laboratory filtration studies, the turbidity of a slurry made up from tap water and topsoil was lowered from 30 to less than 10 Jackson Turbidity Units (JTU) by passing it through filter cloths. The filter cloth served only as a septum upon which a cake formed and the turbidity was reduced by the forming filter cake. Flow rates after 24 hours varied from 0.10 to 0.34 gallons per minute per square foot and are comparable to flow rates through slow sand filters.

GROUNDWATER DATA IN THE CORVALLIS--ALBANDY AREA, CENTRAL WILLIAMETTE VALLEY, OREGON,
Geological Survey, Portland, Oreg.
F. J. Frank, and N. A. Johnson.
Oregon State Engineer Groundwater Report No 17, November 1972. 46 p, 3 fig, 3 tab, 11 ref.

Descriptors: *Groundwater resources, *Water wells, *Well data, *Oregon, *Basic data collections, Water level fluctuations, Aquifers, Drillers logs, Pumping, Water yield, Drawdown, Water utilization, Water quality, Chemical analysis, Hydrographs, Maps.
Identifiers: *Corvallis-Albany area (Oreg), Central Willamette Valley (Oreg).

Basic records of representative existing wells, water levels, and chemical quality of groundwater are presented for the Corvallis-Albany area, Oregon. Most of the high-yield wells produce water from alluvial (sand and gravel) aquifers that underlie the main valley plain or that are coextensive with the present flood plain of the Willamette River. Hydrographs show fluctuations of water levels during 1962-72 in nine selected wells. Water levels are highest during the wet winter and spring months and lowest during the dry summer and autumn months. Well data are tabulated for 415 representative wells whose locations are shown on a map. Most of the data were obtained from well-drillers' reports submitted to the office of the Oregon State Engineer; some of the data were supplied by the well owners or operators. Chemical analyses are tabulated for water samples from 27 wells. Water analyses for 21 wells were made by the U.S. Geological Survey and the rest by commercial or State laboratories. (Woodard-USGS)

GROUNDWATER REGIME IN THE ZONE OF INFLUENCE OF PUMPING (REZHIM GRUNTOVYKH VOD V ZONE VLIYANIYA VERTIKAL'NOGO DRENAZHA),
Bukharskaya Selskokhozyaistvennaya Opytnaya Stantsiya (USSR).
A. G. Kim.
Gidrotekhnika i Melioratsiya, No 6, p 74-76, June 1971. 4 fig.

Descriptors: *Groundwater, *Pumping, Water table, Water level fluctuations, Leaching, Salts, Wells, Observation wells, Curves.
Identifiers: *USSR (Bukhara Oblast).

The groundwater regime in the zone of influence of pumping was investigated in 1967-68 at the Kagan State Farm, Kagan Rayon, Bukhara Oblast. The groundwater regime was studied in a test area covering 450 hectares and containing 5 wells dug to a depth of 25 m and equipped with perforated pipes 325 mm in diameter. Groundwater level measurements were made at 37 observation wells every 5-10 days and daily during leaching to remove salts. Groundwater levels were also measured in the spring and fall at 68 temporary observation wells. Depth of groundwater occurrence in the zone of influence is 1 m greater than in an unaffected area. Deep occurrence of groundwater in the zone ensures adequate leaching of salts from the soil and reduces the salinity hazard. With a well discharge of 20 liter/sec, pumping effects extend over a distance of 300 m, and groundwater within the radius of influence remains consistently at a depth of 440-510 cm. (Josefson-USGS)

GROUNDWATER LEVELS IN NEBRASKA, 1972,
Geological Survey, Lincoln, Nebr.
M. J. Ellis.
Nebraska Water Survey Paper No 34, May 1973. 93 p, 10 fig, 1 tab.

Descriptors: *Groundwater, *Water levels, *Water wells, *Nebraska, Basic data collections, Hydrogeology, Water level fluctuations, Water utilization, Withdrawal, Irrigation, Aquifer characteristics, Water supply, Groundwater recharge.

During 1972 the installation of irrigation wells in Nebraska continued at an active rate. Holt County, with 148 wells, again led other counties, followed by Custer County with 84 wells and Hamilton County with 80 well installations. Adams, Antelope, Boone, Buffalo, Clay, Frontier, Hall, Kearney, Merrick, Phelps, Red Willow, and York

Counties increased their number of wells by 50 or more. The cumulative total number of registered irrigation wells in the State through 1972 is 39,505. The following information is given for each well in the Statewide network of water-level observation wells: year of the earliest recorded water level; highest and lowest recorded water levels, in feet below land surface; a fall 1972 water-level measurement, in feet below land surface; the departure, in feet, of the fall 1972 water level from an assumed normal water level; and the change from previous fall, or net difference, in feet, between the fall 1972 and fall 1971 water-level measurements. STREAM DEPLETION FACTORS, ARKANSAS RIVER VALLEY, SOUTHEASTERN COLORADO: A BASIS FOR EVALUATING PLANS FOR CONJUNCTIVE USE OF GROUND AND SURFACE WATER,
Geological Survey, Lakewood, Colo.

Open-file report, November 1972. 8 p, 5 fig, 4 map, 1 tab, 12 ref.

Descriptors: *Water resources development, *Surface-groundwater relationships, *Withdrawal, *Groundwater recharge, *Colorado, Watershed management, Water utilization, Analog models, Mapping, Streamflow forecasting, Maps, Hydrology, Hydrogeology.
Identifiers: *Arkansas River Valley (Colo).

The Arkansas River valley in Colorado is a stream-aquifer system that consists of the Arkansas River and the associated valley-fill deposits. The history of delivery of irrigation water by canals indicates that the supply has been inadequate during some seasons and some years. The shortage can be reduced by carefully designed conjunctive use of ground and surface water. An analog model of the Arkansas River valley in Colorado was constructed to facilitate such designs (Moore and Wood, 1967). The purpose of this report is to make hydrologic maps available to water managers and planners. The maps are useful for estimating the changes in streamflow caused by recharge to or withdrawal of ground water from the valley-fill aquifer between Pueblo, Colo., and the Kansas State line. Use of maps and a concept described will assist planners and managers in their task of providing timely delivery of water to the users and in the administration of water laws. (Woodard-USGS)

WATER RESOURCES OF HEMPSTEAD, LAFAYETTE, LITTLE RIVER, MILLER, AND NEVADA COUNTIES, ARKANSAS,
Geological Survey, Washington, D.C.
A. H. Ludwig.
Available for sale by GPO, Washington, D.C. 20402, Price $4.00. Water-Supply Paper 1998, 1972. 41 p, 9 fig, 5 plate, 10 tab, 23 ref.

Descriptors: *Water resources, *Groundwater resource, *Surface waters, *Hydrologic data, *Arkansas, Basic data collections, Water wells, Aquifer characteristics, Water yield, Streamflow, Flow rates, Water quality, Chemical analysis, Hydrogeology, Water utilization, Water supply, Low-flow frequency, Flood frequency, Water levels.
Identifiers: *Red River Valley (Ark), Hempstead County (Ark), Lafayette County (Ark), Little River County (Ark), Miller County (Ark), Nevada County (Ark).

The five-county area in southwest Arkansas that consists of Hempstead, Lafayette, Little River, Miller, and Nevada Counties possesses abundant water resources. Nearly all water supplies are obtained from groundwater. Surface water is used primarily for municipal supply at Texarkana and for industrial supply at a papermill near Ashdown. The aquifers of Cretaceous age are the principal sources of freshwater in northern Hempstead and Nevada Counties, where wells yield as much as 300 gpm of good quality water from depths as great as 1,200 feet. Aquifers of Tertiary age are good sources of water in Miller and Lafayette Counties and in southeastern Nevada County. Terrace deposits of Quaternary age are good sources of water in Little River and Lafayette Counties. The Red River is the largest source of surface water in the project area. It drains about 48,000 square miles upstream from the area and has an average flow of 12,180 cfs. The principal reservoirs in the area are Millwood Reservoir on Little River (capacity, 1,858,000 acre-feet) and Lake Erling on Bodcau Creek (capacity, 49,000 acre-feet). More than 5,500 lakes and farm ponds of 5 acres or less have a combined storage capacity of more than 14,000 acre-feet. Water in the Red River is high in chloride and dissolved solids and, consequently, is chemically unsuitable for most uses unless treated. (Woodard-USGS)

GROUND-WATER BASIC DATA OF CAVALIER AND PEMBINA COUNTIES,
Geological Survey, Bismarck, N. Dak.
R. D. Hutchinson.
North Dakota Geological Survey Bulletin 62, Part II. and North Dakota Water Commission County Ground-Water Studies 20, Part II, 1973. 606 p, 29 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, *North Dakota, Water utilization, Hydrologic data, Basic data collections, Water wells, Well data, Chemical analysis, Water supply, Municipal water, Domestic water, Livestock, Industrial water, Irrigation water.
Identifiers: *Cavalier and Pembina Counties (N Dak).

The purpose of the hydrologic investigation in Cavalier and Pembina Counties, N. Dak., was to determine the quantity and quality of groundwater available for municipal, domestic, livestock, industrial, and irrigation uses. Specifically, the objectives were: (1) determine the location, extent, and nature of the major aquifers; (2) evaluate the occurrence and movement of groundwater, including the sources of recharge and discharge; (3) estimate the quantities of water stored in the aquifers; (4) estimate the potential yields to wells tapping the major aquifers; and (5) determine the chemical quality of the groundwater. The information was collected chiefly between 1968 and 1971, and contains: (1) geologic and hydrologic data for 2,286 wells, test holes, and springs; (2) water level measurements in 125 observation wells; (3) lithologic and geophysical logs of about 886 test holes and wells; (4) chemical analyses of 296 water samples; (5) particle-size analyses of material from various aquifers; and (6) the hydraulic conductivity of materials from various depths and locations.
